STAMFORD.—For the erection of a swimming bath, for the corporation.—Mr. F. R. Ryman, engineer:—

Roberts Brothers, Stamford	£1,050
Hinson & Co., Stamford	985
J. W. Rouse, Stamford	974
J. Peasgood, Stamford	950
E. E. Howes, Stamford*	830
E. Nelson, Stamford	818

STOCKPORT.—For street-making work, for the corporation.—Mr. J. Atkinson, borough surveyor:—

Broadstone-road.—P. D. Hayes & Sons, Stockport, £2,144.
Athens-street group.—J. Briscoe, Stockport, £2,268.

SUNBURY-ON-THAMES.—Accepted for the supply of granite, for the urban district council.—Mr. H. F. Coales, surveyor:—

Granite.—Rowe & Mitchell, London, 14s. per ton.
Tar-macadam.—J. Oakes & Co., Alfreton, 17s. 10d. and 18s. 4d. per ton.
Flints.—Cremer, Goodenough & Co., Limited, Faversham, 5s. 8d. per yard.

WILTS.—For the reconstruction of North Tidworth Bridge, Salisbury Plain, for the county council.—Mr. J. G. Powell, county surveyor:—

	Brickwork.	Reinforced concrete.
Bourne & Jenkinson, Andover	£607	£620
F. Burton, Durrington	515	530
W. Harris, Bulford	539	500
Grace & Sons, Ludgershall	441	459
Sturgess Brothers, Appleshaw	455	450
Isley & Co., Trowbridge	402	438†

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

18-21.—Annual Congress of the Sanitary Association of Scotland, at Montrose.

25-27.—Municipal Tramways Association: Annual Conference at West Ham.

APPOINTMENTS OPEN.

WATFORD URBAN DISTRICT COUNCIL.
HIGHWAY SURVEYOR.

The Council is prepared to consider applications for the position of Highway Surveyor to act under the instructions of the Engineer and Surveyor to the Council, at a salary of £150 per annum, rising by annual increments of £10 to a maximum of £180.

Forms of application, and the terms and conditions attaching to the appointment, may be had of the undersigned, to whom applications, with copies of three testimonials, must be sent in not later than 12 noon on **Saturday, 24th August, 1912.**

Canvassing any member of the Council, either directly or indirectly, will disqualify.

W. HUDSON,
Clerk and Solicitor.

Council Offices,
14 High-street,
Watford, Herts.
August 6, 1912.

MADRAS CORPORATION, INDIA.
WANTED: ASSISTANT WATERWORKS ENGINEER.

The President, Corporation of Madras, invites applications for the Appointment of a Waterworks Assistant to the Special Engineer (J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c.).

The duties will be to assist the Special Engineer in the design, construction and maintenance of works connected with the Water Supply Distribution System of the City of Madras, especially cast-iron main laying and the installation and working of waste-water meters.

The salary will be Rs.400 (£26 13s. 4d.) per mensem. An allowance of Rs.30 (£2) per mensem will be paid to the Officer appointed so long as he maintains and uses on the work a first-class motor bicycle in good running order. No other allowance of any kind will be made.

Before sailing for Madras, the successful candidate will be required to sign a three years' agreement to be prepared by the Corporation. By mutual consent the appointment may be extended for a further period.

The Corporation reserves the right to determine the appointment at any time by three months' notice in writing or by payment of one month's salary.

The Officer appointed will be allowed ordinary first-class railway fares and second-class steamship passage to Madras, *viâ* Marseilles and Bombay, by P. and O. steamer. A like class return free passage will be granted on the termination of the appointment, subject to satisfactory service according to the conditions of the agreement. Half-pay will be granted on the voyage out from the date of leaving England.

Leave will be granted on full pay to the extent of one month for every eleven months of active service, but for not more than three months at a time.

Preference will be given to candidates who have had experience in the design and maintenance of water-pipe distribution systems, including detection and prevention of waste by waste-water prevention meters, stethoscopes and other means.

Applicants must not be more than 35 years old, and copies of certificates of age, testimonials and medical certificate of fitness for service in India must be enclosed with the applications, which must reach the undersigned *not later than* 31st August, 1912.

The applications will be sent out to Madras, where the selection will be made by the President of the Corporation.

The President reserves the right of rejecting all applications without giving reasons.

The Officer appointed will be required to commence his duties in Madras not later than eight weeks after he has received notification of the acceptance of his application.

Applications must be in writing, and should be sent to the undersigned in envelopes superscribed "Waterworks Assistant."

JAMES MANSERGH & SONS.
Agents to the Corporation of Madras.

5 Victoria-street,
Westminster,
London, S.W.
August 7, 1912.

ILKLEY URBAN DISTRICT COUNCIL.
APPOINTMENT OF ASSISTANT SURVEYOR.

The Council invite applications for the appointment of an Assistant to act under the direction and supervision of their Surveyor.

Applicants should possess a thorough knowledge of building construction, and be able to accurately level and survey.

Preference will be given to those candidates who have had previous experience in the Surveyor's Department of a local authority.

Salary £70 per annum, payable monthly.

Applications, in Candidate's own handwriting, stating age, qualifications and experience, and accompanied by copies of three testimonials of recent date, to be sent so as to reach the undersigned not later than 12 o'clock noon on Monday, the 26th August instant, endorsed "Assistant Surveyor."

Canvassing, directly or indirectly, will positively disqualify.

(By order)
F. S. ECKERSLEY,
Clerk of the Council.

Town Hall, Ilkley.
August 7, 1912.

COUNTY OF HEREFORD.
ARCHITECTURAL ASSISTANT.

Applications are invited for the post of Chief Architectural Assistant in the County Surveyor's Offices at Hereford.

Applications, marked "Assistant," together with three original testimonials (which will be returned), to be addressed to J. R. Symonds, Esq., County Clerk, Shirehall, Hereford, and delivered not later than noon on Monday, September 2nd, 1912.

Candidates must not be more than 30 years of age, and must give evidence of training and experience in Architects' Offices.

The person appointed must have had experience in the design and construction of Secondary and Elementary Schools, and be well versed in—

1. The preparation of working drawings and details.
2. Specifications and estimates for builder's work.
3. Surveying and levelling.
4. Measuring completed work.

Salary £150 per annum, with travelling expenses.

The appointment to be determined by one month's notice on either side.

Preference will be given to Candidates who have gained experience in County Architects' Offices.

(By order)
G. H. JACK,
County Surveyor.

Shirehall, Hereford.
August 10, 1912.

MILTON REGIS URBAN DISTRICT COUNCIL.

The above Council invite applications for the Appointment of General Working Foreman, who must devote all his time to the duties of the office. Commencing wage 27s. per week. Practical experience in the Construction, Maintenance and Cleansing of Roads and Sewers, and Supervision of Labour is essential.

Applications, in candidate's own handwriting, stating age, accompanied by copies of three testimonials, and endorsed "General Foreman," to be delivered to the undersigned on or before Monday, the 26th August, 1912.

Canvassing will disqualify.

JOHN DIXON, JUNR.,
Clerk to the Council.

Town Hall, Milton Regis, Kent.
August 13, 1912.

COUNTY BOROUGH OF NORTHAMPTON.

Applications are invited for the post of Temporary Town Planning Assistant in the Borough Engineer's Department. Salary £2 per week.

Applications, endorsed "Temporary Assistant," stating age, qualifications and experience, accompanied by copies of three recent testimonials, to be delivered to the undersigned not later than Friday, August 23rd, 1912.

ALFRED FIDLER, M.INST.C.E.,
Borough Engineer.

Borough Engineer and Surveyor's Office,
Guildhall,
Northampton.
August 3, 1912.

ASSISTANT SURVEYOR OF ROADS required by the Gold Coast Government for the Public Works Department for two tours, each of 12 months' residential service, with possible extension. Age between 25 and 40, preferably unmarried. Strict medical examination and vaccination if necessary.

Salary £300 a year, rising to £350 by annual increments of £10. Whilst actually performing the duties of the office in the Colony a commuted allowance of £7 10s. a month will be paid in lieu of travelling, lodging, and all other allowances.

Free first-class passage out and home again on satisfactory termination of engagement. Half salary on voyage out, full salary from date of arrival in the Colony.

Two months' leave on full pay after 12 months' tour, increased to 4 months if returning to the Colony, with full pay during voyage or voyages and free passages.

Candidates should have received a good technical education, and have had experience similar to that obtained in a large Municipal Engineer's Office, or in the Office of an Engineer in good general practice. They should have had experience in road surveying in a tropical country, or on railway surveying in this country, and be experienced in the design and construction of large engineering works, including concrete, preferably reinforced, and steel construction, in the preparation of plans, specifications, bills of quantities and estimates, and be proficient in the use of surveying instruments, including the mining dial.

They should also be well up in building construction.

Application by letter (no special form required), stating age, whether married or single, giving full particulars of experience, accompanied by copies of testimonials (not originals), with names and addresses of referees of whom enquiries can be made as to capabilities and character, should be sent as soon as possible to the Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

Quote M 5497 on left-hand top corner of application.

COUNTY BOROUGH OF BOLTON.

The Corporation are prepared to receive applications for the position of a Junior Assistant with Municipal experience in the Borough Engineer and Surveyor's Department.

Salary commencing at £70 per annum.

Applications, in candidate's own handwriting (endorsed "Junior Assistant"), stating age, qualifications, and experience, together with copies of three testimonials of recent date, which will not be returned, to be delivered to the undersigned not later than the 31st August, 1912.

Canvassing, directly or indirectly, will be considered a disqualification.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton.
August 14, 1912.

EAST SUFFOLK COUNTY COUNCIL.

Wanted, in the Office of the County Road Surveyor, a Surveyor's Account Clerk. Salary £90 per annum, rising for approved service to £120 per annum.

Applicants must have a good knowledge of book-keeping and be quick and accurate at figures.

Applications, stating age and experience, and accompanied by copies of not more than three recent testimonials, to reach me here on or before the 22nd August, 1912.

A. TOWNSHEND COBBOLD,
Clerk of the County Council.

County Hall, Ipswich.
August 9, 1912.

ASSISTANT required, temporary; experience in Sewerage and Tidal work essential; A.M.I.C.E.—Apply, stating salary required, J. P. Wilkinson & Son, 301 Cathedral-street, Manchester.

MISCELLANEOUS.

FOR SALE.—Bound Volumes, 17 to 30 inclusive, of The Surveyor.—Cash offers to Box 1,179, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

(Continued on p. xxii.)

EX-PUPILS AND ASSISTANTS.

BACHELOR IN ENGINEERING of Dublin University, 3½ years' experience of design and construction of buildings, and sewerage and water schemes, good testimonials, desires situation in municipal or private office.—Alpha, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

(Continued on p. xxvi.)

TENDERS WANTED.

BROMLEY RURAL DISTRICT COUNCIL.

MATERIALS FOR ROADS.

TEAM LABOUR.

The Bromley Rural District Council invite Tenders for the Supply of Road Materials required during the year ending the 30th September, 1913, and for Carting of Materials and Team Labour during the same period, in respect of the under-mentioned Parishes:—

Chelsfield,	Mottingham,
Cudham,	North Cray,
Downe,	Orpington,
Farnborough,	St. Mary Cray.
Hayes,	St. Paul's Cray,
Keston,	West Wickham.
Knockholt,	

Separate Tenders must be made in respect of each item as separately numbered on the Form of Tender relating to each Parish.

Tenders to be delivered to me, prepaid, not later than twelve noon on Monday, the 2nd September, 1912.

Forms of Tender may be obtained at the Offices of the Council as stated below, and no other Forms will be accepted. Tenders received after 12 noon on the 2nd day of September, 1912, will not be entertained.

The lowest or any Tender will not necessarily be accepted.

(By order)
EDWARD HASLEHURST,
Clerk to the Council.

Council Offices,
Park House,
Bromley, Kent.
August 12, 1912.

BROMLEY RURAL DISTRICT COUNCIL, KENT.

HIRE OF STEAM ROLLER.

Tenders are invited for the Supply of a Steam Roller on Hire.

Forms of Tender may be obtained from the undersigned, and should be returned to me, duly completed, and endorsed "Steam Roller," not later than Monday, the 2nd September, 1912.

(By order)
EDWARD HASLEHURST,
Clerk to the Council.

Council Offices,
Park House,
Beckenham-lane,
Bromley, Kent.
August 12, 1912.

HAMPTON URBAN DISTRICT COUNCIL.

STEAM COAL.

The above Council invite Tenders for the Supply of Best Welsh Double-screened Steam Coal, as may be required for the ensuing year, in trucks at Hampton Station (L. and S.W. Railway).

Forms of Tender, Conditions, and all particulars can be obtained of the undersigned, at the offices of the Council, where the Tenders, duly filled up, must be delivered, sealed and endorsed "Tender for Steam Coal," not later than 4 p.m. on Monday, the 2nd September, 1912.

Dated this 10th day of August, 1912.

(By order)
SIDNEY H. CHAMBERS,
Surveyor.

Public Offices,
Hampton, Middlesex.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. AUGUST 23, 1912. No. 1,075.

Minutes of Proceedings.

Specifications for Carriageways.

Whatever opinions different engineers may hold as to the form which a specification should take for any particular kind of work, nearly all will agree that in the case of a road it is very difficult to make a covering specification without liberal use of such expressions as "to the satisfaction of the engineer," while, on the other hand, it is seldom that a specification of a full and detailed character can be drawn up so that with little variation it may be applicable to a considerable number of works in any area of moderate size, or coming within the experience of any individual. It is therefore with much pleasure that we draw the attention of road engineers to the "Suggested Clauses to be included in a Specification for a Bituminous Bound Carriageway," drawn up by Mr. J. S. Brodie, M.INST.C.E., and presented at the recent annual general meeting of the Institution of Municipal and County Engineers. Every engineer engaged in road construction or road reformation must draw up his own specification for each particular piece of work, but in the paper referred to Mr. Brodie supplies road engineers with a valuable guide as the *manner* in which the specification should be drawn up, as well as with definite suggestions as to the *matter* of each clause. As regards the method of expressing traffic intensity, it will be noted that Mr. Brodie favours the measure "tons per annum per lineal yard of width." This measure, it may be suggested, is less satisfactory on a country road than in a city street. On some country roads the traffic is well distributed over the width of the carriageway, while on others a large proportion of the traffic is concentrated near the middle, even when the carriageway, taking everything into consideration, is no wider than it ought to be. Assuming, however, that the width is about right, the traffic may be fairly measured in tons per annum, though the further suggestion may be made—and we make it now—that in either case the crude measure of traffic may be reckoned as affected by an intensity factor based partly on the extent to which traffic is concentrated on certain days, partly on the extent to which it is concentrated on the middle of the carriageway, and partly upon its destructive or its harmless character. If, for instance, we use a qualifying factor of ⅔ because the road is much used by traction engines, no one can deny that, whether this factor is right or whether it is wrong, we are nearer the truth than we should be if we took no account at all of this item of traffic except in tons per annum: a course, be it noted, which amounts to a definite statement that this traffic is not more destructive than other traffic to an extent that matters.

The road crust and foundation described in Mr. Brodie's clauses consist, it will be observed, of two separate layers, the lower one not less than 7 in. thick, and the upper of bituminous bound material 4 in. thick, the top of the foundation course being finished off in such a way that the other course rests upon it as a separate slab. While there are doubtless circumstances under which this type and these thicknesses are suitable, we are inclined to believe that practice will on the whole tend away from this particular type in two directions—that is, the upper layer will either be bonded into the foundation course so that the strength of the crust is that of a single crust of the full depth, or it will be somewhat reduced in thickness, becoming essentially a carpet layer on a sub-crust sufficiently thick and strong in itself to carry the loads imposed by the traffic. What is, however, at the moment a more important matter is the good example which Mr. Brodie sets in specifying a sub-crust of such a thoroughly sound character. As regards the upper crust, opinions differ not only with respect to the sizes of the metal which may be employed, but also as regards the extent to which these sizes should be mixed. As, however, Mr. Brodie specifies that the stone shall be spread immediately after mixing—the stone at 220 deg. Fahr. and the tar between 260 deg. and 280 deg. Fahr.—it is clear that the different sizes of stone will be fairly well jammed together in a crust built up in the way he describes, each of the upper crusts being partly within the voids of the course below it. We congratulate Mr. Brodie upon his "Suggested Clauses" and upon the judgment which he has shown in the remarks with which they are introduced to the notice of surveyors.

* * *

Wiltshire Roads.

As may be gathered from a perusal of the extracts which will be found on another page, there are some noteworthy passages in the annual report of Mr. J. George Powell, county surveyor of Wiltshire, who, like others of his profession, is wrestling with the problems presented by the increasing amount and severity of traffic on roads which were

developed to suit quite different conditions. Usually regarded as a part of Wessex, the county of Wiltshire merges, without any general or sudden change of character, into Hampshire on the south-east and Dorset on the south-west. Lying clear of the geologically patchy country to the west, it is shut off by the Mendips and the Cotswolds from the Severn estuary and the Bristol Channel; but if approached from the north-east it is found to be the last of a series of counties which are all traversed by a narrow belt of lower cretaceous strata, dividing each county into two parts, so that, like the counties of Cambridge, Bedford, Oxford and Berkshire, Wiltshire is divided by this narrow belt into an oölitic area to the north-west, and an upper cretaceous area to the south-east, the latter including Cranborne Chase, Salisbury Plain, and Savernake Forest. The character of the county is agricultural and pastoral, with no industrial areas within it or near it, and it is by no means a specially fertile country. It was not to be expected that such an area should have been found prepared for the new traffic conditions, for which the roads of some counties were less unfitted owing to the necessity for providing for traffic between manufacturing towns or that radiating from thickly-peopled and flourishing areas. It is also to be remarked that where large areas were almost wholly under pasture or were untilled land, all except a few of the main roads were sufficient for their purpose, even when of a very light character indeed, under conditions such as those of the 'seventies of last century; and it is not a matter for surprise that in Wiltshire, with its three acres per head of population, about 70 per cent of the roads were, up to 1877, made by annual additions of stone to ruts formed originally in the natural soil. Such roads, of course, were, and are, unsuitable for the reception of road crusts appropriate for the traffic of to-day, and while we hope that the resources of the Road Board during the next few years, and the relief afforded by each instalment of reconstruction, may go far to solve the more pressing problems which confront surveyors, we fully realise that it is by no means generally admitted that there is any solution in sight.

The fact that a considerable mileage of the Wiltshire roads is an oölitic limestone or chalk suggests that the county may offer a favourable field for the exercise of the policy of temporary starvation of roads, especially if carried out in some such manner as that which we suggested last week in reference to a similar problem in Herefordshire (see p. 225). The climate presents no special obstacles to maintenance by small constant repair, and the rainfall is moderate, being about 30 in., or a little more, over the greater part of the county. It is a little less than 30 in. over Salisbury Plain, and reaches about 35 in. near the Western border. Mean falls for twenty-nine years were: at an elevation of 319 ft. on Salisbury Plain, 28·56 in.; at Landford (167 ft.), 30·16 in., and at Ludgershall (422 ft.), 31·31 in.

* * *

A Proposed London Improvement.

A proposal for the construction of an important new street in the City of London has recently been put forward by Mr. Arthur Crow, one of the London district surveyors. Probably every one of our readers has some acquaintance with London, and those who have the bump of locality reasonably well developed will remember that there are two main west-to-east traffic arteries through central London: one the chain of streets termed Oxford-street, Holborn, Newgate-street, and Cheapside; and the other consisting of the Strand, Fleet-street, Ludgate-hill, and a portion of Cannon-street and Queen Victoria-street. These two arteries meet at the Bank, where several other important main streets serving the eastern part of London also converge. The result, of course, is a very great congestion of traffic at the Bank, which, if it were not for the wonderful system of control exercised by the City Police, would be a byword throughout Europe. The Government have recently erected new General Post Office buildings, and they now propose to pull down the old Post Office buildings in St. Martin-le-Grand, near the junction of Newgate-street with Cheapside, and to erect buildings for other Government purposes. The proposal now put forward is that the responsible authority, which is here the City Corporation, should, possibly with the financial aid of the London County Council, come to terms with the Government, by which a strip of the old Post Office site is given up to form the entrance to a proposed new street from Newgate-street to London-wall. If such a street were formed it would be possible for the whole of the traffic from the Oxford-street-Holborn route to go direct to Liverpool-street Station without having to pass through the congested traffic at the Bank, for the new street would strike the ordinary omnibus route at London-wall, some little to the north of the Bank. A further point in favour of the scheme is that about a quarter of a mile would be saved in the distance from Newgate-street to Liverpool-street.

The cost of an improvement of this nature would obviously be very large, and it is one of the anomalies of London government that here, in a matter which concerns all London, the authority with whom the initiative lies is a body having control of 1 square mile only of the 117 square miles that constitute the county area. But traffic improvements in the centre of London are very much needed, and it is essential that before very long some measures should be taken to reduce the ever-increasing volume of traffic at the Bank. It is to be hoped that, before new buildings are erected on the old Post Office site, the desirability of commencing to form a new street in the position proposed will be very seriously considered by the City Corporation.

* * *

By-laws in Rural Districts.

The operating of building by-laws in rural districts is a question which has been attracting considerable attention of late; and the problem of building houses which can be erected at a reasonable and remunerative cost and which are at the same time fit for habitation in every respect and in accordance with the by-laws in force is one which experts have not found easy of solution. The subject is one which bristles with difficulties, and the paper by Mr. Halsey Ricardo, F.R.I.B.A., and the discussion which followed its reading at the York Congress of the Royal Sanitary Institute were of special value in drawing attention to certain questions of policy in regard to the modification of a model code. As Mr. Ricardo observed at the outset, the function of by-laws is not to check building operations, but to secure good building and to protect the public from the dangers to which they would be subjected if the jerry-builder were free to pursue his operations without supervision or restriction. It will be freely admitted that existing by-laws have in many cases produced a type of building which is far from ideal, but, on the other hand it must be borne in mind that they have checked an enormous quantity of radically bad work.

The chief argument which Mr. Ricardo advanced in favour of "treating each case on its merits under a set of general regulations" was that the enforcing of regulations to their logical extremities regardless of the local conditions and requirements results in harshness and absurdities. Inasmuch, however, as the model by-laws for rural districts only deal with the structure of buildings from the point of view of health and sanitation, this argument would not appear to be entirely applicable. It may be urged against the adoption of a rigid code that present-day knowledge in regard to sanitation—and particularly bacteriology is by no means complete, but this contention raises a point which is entirely different

in principle from that which is involved in the argument for elasticity or the exercise of a dispensing power in individual cases. If the advance of scientific knowledge and achievement justifies such a course, there would be no difficulty in recasting the by-laws to meet new circumstances of general application. On the whole, while fully appreciating the many points of interest raised by Mr. Ricardo, we hold to the view that the best interests of our rural populations are served by the enforcement of a rigid code of by-laws in regard to sanitation and construction so far as it relates to hygiene.

* * *

Insects and Disease.

Following upon our recent observations in this column with regard to bacteria in refuse heaps and road dust, we give on another page extracts from an article by an American scientist upon the dissemination of disease by insects. From these it will be seen how closely the two subjects are connected and how necessary it is for the officials of sanitary authorities to recognise this fact and to act upon it. The description of the peculiar habits of flies and fleas is very interesting and may afford clues which would assist in solving some of the problems of the occurrence of typhoid in this country. We are personally acquainted with cases of typhoid where single members of two or three families in one road have had serious attacks of this disease, while none of the other members of the families were attacked, although they all lived under exactly the same conditions and consumed the same food and water. The medical authorities were unable to ascertain the exact source of infection, but, as a matter of course, the drains were taken up and reconstructed at considerable expense to the owners and much inconvenience to the occupiers. The drains were old, but not in a bad condition, and as in one instance only one member of a family of six was affected it is very much open to doubt whether the drains were responsible for the illness, even to a small degree.

It may be argued, on the lines recently suggested by Mr. E. Willis, engineer and surveyor to the Chiswick Urban District Council, that all were equally infected, but that the white corpuscles of five were in a healthy, efficient condition, while those in the one member of the family were weak and unable effectively to resist the inroads of the typhoid germs. Such a state of affairs is possible, but rarely likely to occur in a family of six persons all living under exactly similar conditions, and even less probable in several families living in the same neighbourhood. In our opinion there is much to be said in this instance for the theory of transmission by flies as described by Dr. Rucker, and, if it could have been proved that the illness was due to flies, then the expense and inconvenience of reconstructing the drains might have been avoided. In any case, in the absence of any serious defect in the drains, it might have been worth while to investigate the possibility of dissemination by flies before pulling up the drains.

Condition of Roads in Ireland.

The report of the Local Government Board for Ireland for the year ended March 31st last was submitted recently to the House of Commons. From this it appears that during that period thirty-six loans of a total amount of £61,459 were sanctioned to twelve county councils for the improvement of roads by steam-rolled coatings and seven loans of a total amount of £10,016 to seven county councils for steam-rollers and other modern appliances for road work. The system of maintenance of public roads by direct labour has been continued and extended by ten new schemes approved by the Board. In most of the counties which have adopted this system it is working well; but an inquiry held regarding the administration of direct labour in one county demonstrated that in order to secure satisfactory results supervision must be thorough and continuous, and that unless that is secured grave risk of loss arises in connection with the supply of materials. The new system necessarily increases the responsibilities of the county surveyor's staff, and it is regarded as most desirable that their whole time should, where possible, be secured for the public service. The Public Roads (Ireland) Act, 1911, received the Royal Assent during the year under review, and the Board issued a circular to road authorities drawing attention to its provisions. The Act contains new detailed provisions as to the construction and use of locomotives on highways; but its main provision, which is substantially the same as the corresponding English enactment, confers on a road authority power to recover from any person causing damage to a road by excessive weight of vehicles or extraordinary traffic the cost of making good such damage. Under the Act the Board are required to make regulations for certain purposes, and these are in course of preparation.

* * *

Public Health in Johannesburg.

The biennial report of Dr. Charles Porter, the medical officer of health of Johannesburg, some account of which will be found in another column, is a document of surpassing interest inasmuch as it forms a record of the sanitary progress of a city whose growth and prosperity are one of the romances of British colonial enterprise. The supervision of the public health of a city whose population approaches 250,000 is, in any circumstances, a task of considerable magnitude, but it becomes quite exceptional in the case of a city like Johannesburg with the peculiar problems of a mixed population and a growth of feverish rapidity. The progress which is revealed by Dr. Porter's report is truly remarkable, and we may take the statistics in regard to typhoid and enteric fevers as an indication of what has been accomplished. The figures as to the former disease show a decrease in mortality of about 40 per cent, and a steady decline in the number of cases. As regards enteric, too, it is very satisfactory to observe that the prevalence of this disease during the period 1906–9 was 50 per cent less than in 1903–6, while the triennium 1909–11 showed a further decline of 41 per cent. Dr. Porter fairly points out that there is still considerable room for improvement, but, having regard to the peculiar local circumstances, the results are very encouraging and reflect great credit upon all who are immediately responsible for the public health of the city.

* * *

Yeadon's Municipal Bazaar.

In these days when mankind is so alert to the main chance it occasions no surprise when a new method is invented for the purpose of raising the wind. Thus we read without strong emotion that the urban district council of Yeadon have decided to hold a municipal bazaar to further the movement for a much-needed street improvement. Such a project opens up quite an interesting vista of activity and enterprise to the municipal world, and not improbably to the municipal surveyor and his family circle. It lends a hitherto unsought objective to the familiar amusements and side-shows of the bazaar—to the lucky tub of dubious ethics, the deceptive collection of curiosities, the eccentric artistry of the gentlemen's bonnet-trimming competition, and last, but not least, to the heroic efforts of the ladies to accomplish the operation of fabricating a soap-dish. All this and much more of a merry and entertaining description will doubtless add to the gaiety of Yeadon, and the financial proceeds of its bazaar. The object is certainly a praiseworthy one, with nothing of narrowness of sectarianism in it, and, as the local rates are already 8s. in the £, it ought to appeal forcibly to the imagination of the ratepayers of every degree and class.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

Following the proceedings reported in last week's issue the subjoined paper was considered at the recent annual meeting of the Institution of Municipal and County Engineers.

SUGGESTIONS TOWARDS A STANDARD SPECIFICATION FOR BITUMINOUS-BOUND CARRIAGEWAYS.

By John S. Brodie M.Inst.C.E.
Borough Surveyor, Blackpool

Two most successful papers were read and discussed in another place a year ago by two of our esteemed members—*viz.*, Mr. J. Walker Smith and Mr. Henry Percy Maybury, M.M.Inst.C.E.—on highway construction and maintenance. At the same time the Road Board issued general directions and specifications (Nos. 1 to 6) relating to the tar treatment of roads. Both of these events were of the utmost importance to all who are engaged in the responsible duties of road surveyors, and the author was one of those who gladly availed himself of the information contained in the papers, and of the directions and specifications contained in the Road Board's issue, in revising his specifications both for new roads as well as for reconstructing and resurfacing existing roads in his district.

The following clauses and suggestions are submitted as a basis of discussion, in the hope that they may be found useful to surveyors having the responsibility for similar works, until a more complete experimental knowledge of the properties of materials suitable for road making is available, as it must be obvious to all that we are really at the beginning only of a sound and reliable appreciation of the various materials which should be used in road construction and maintenance so as to obtain the best economical results. In this connection it is with very great pleasure that we note the steps which it is understood are now being taken by the Road Board to accurately test, classify, and standardise materials and processes which may be found successful in road construction. It is the author's practice to carry out road construction both departmentally and also by expert road constructors working under contracts to construct certain lengths of roads to a specification, and to subsequently maintain the same for a certain number of years (usually five years) under financial guarantees.

Further, the author does not confine his invitations for tenders for work in accordance with his own specification only, but he also invites skilled and experienced road constructors to submit alternative general specifications prepared by themselves, including any proprietary articles, or special or patented processes with which their methods of construction may be associated, subject, of course, to guarantees for successful completion and maintenance for a period of years, the object being to secure the best possible results obtainable for a given financial expenditure.

It is, of course, obvious that, however desirable it may be to standardise our road specifications, regard must always be had to local and other conditions requiring special consideration and treatment. No hard-and-fast lines can be laid down applicable to roads in every part of the country, or indeed to every part of the same district. Thus, roads running east and west will require somewhat different treatment to those running north and south, as well as roads closely hemmed in by trees to those in open country. The nature of the subsoil, the gradients, the rainfall, the direction of the prevailing winds, and, above all, the suitability or otherwise of the local materials of construction and maintenance, will all require most careful consideration if the best results are to be attained. The nature and amount of traffic likely to pass over the road is one of the first things to be ascertained. Much attention has been recently given to this important subject, both in this country and in the United States.

The elaborate and accurate methods of enumerating traffic on highways as exemplified by one of our esteemed members, Mr. William Jones, Assoc.M.Inst.C.E., surveyor to Colwyn Bay Urban District Council, by Messrs. Blanchard and Patterson, of Providence, R.I.; and by Major Crosby, chief engineer to the States Roads Commission of Maryland, M.S., all of which have been reported in The Surveyor, are worthy of all praise for their painstaking accuracy. Although there is at present some difference of opinion in regard to the relative importance of the different kinds of traffic so far as the maintenance of the road is concerned, there is no doubt but that surveyors will sooner or later agree on a standardised system of enumerating traffic.

The author does not at present propose to further discuss this interesting subject, but will assume that, traffic data having been ascertained with more or less accuracy, it remains to express it in terms which will find common acceptance. Thus, instead of one surveyor expressing his traffic intensity in tons per day and another in tons per week, the author urges that traffic be always expressed in tons per annum per lineal yard of width of roadway. Further, the author suggests that, for convenience, a "scale of traffic intensity" be agreed upon, on somewhat similar lines to the "scale of hardness" for water or minerals, ranging from a minimum of 10,000 tons per lineal yard of width of road per annum to, say, a maximum of 300,000 tons, with intervals of 10,000 tons. The suggested scale would, therefore, be "traffic intensity 10, 20, 30, 40, up to 300," and its meaning would be both definite and easily understood.

Suggested clauses to be included in a specification for a bituminous-bound carriageway:—

(1) *General.*—The carriageway is lin. yds. in length, lin. ft. in width, and has an area of sq. yds.; it is bounded on both sides by stone kerbing (or wayside ditches or channels); its general direction east and west (or north and south, or any nearer definition); the gradients are from 1 in. to 1 in. ; the traffic intensity is, say, 50; it is closely shaded by trees on one (or both) sides (or is open); the subsoil is ; the prevailing direction of the wind is ; the stone available within miles is ; tar can be obtained at a distance of ; and the nearest railway goods depot is at a distance of .

(2) *Period for Construction.*—The work of construction will be carried out during a period of weeks from, say, January to, say, April, and the traffic will be partially (or wholly) suspended while the work is in progress.

(3) *Sub-Foundation.*—The contractor must excavate or fill in the site of the road, so as to form the underbed to the proper levels and contour of the foundation, and shall thoroughly water and roll with a 10-ton steam roller before laying the hand-packed rubble hereinafter specified.

One or more longitudinal subsoil drains must be laid, if required, where the subsoil is of an impervious nature, such as clay, peat, or other water-carrying material. Such drains shall consist of butt-ended drain tiles 3 in. in diameter, laid in trenches 2 ft. 6 in. in depth, and must be connected to the road gulleys or channels. After the tiles are laid the trenches shall be filled up with sand, gravel, or other open or porous material.

(4) *Foundation.*—The foundation shall consist of hand-packed rubble stone, preferably of sandstone, carefully selected. The stone must not be less than 7 in. in depth, from 5 in. to 9 in. in length, and from 3 in. to 6 in. in width, laid on edge, the stones being laid lengthwise across the roadway, to the finished profile. The interstices of the pitching must be thoroughly "blinded" up with any of the following material—*viz.*, broken concrete, broken sandstone, or specially hand-picked clinker. The whole must then be thoroughly watered and rolled with a 10-ton steam roller, afterwards the larger pieces of packing must be picked out, rebroken, respread, and watered, and rolled again to the proper profile. This process must be repeated until the surface presents the appearance of a well-rolled macadam road. The depth of the foundation when the rolling is completed must be not less than 7 in. No tar-macadam must be laid until the foundation has been inspected and approved by the surveyor or his assistant or inspector.

(5) *Stone for Tar-Macadam.*—The tar-asphaltum macadam shall be made with white or gray coloured limestone, or other stone, from a quarry to be approved by the surveyor. The stone shall be broken and gauged to three sizes—*viz.*, not less than 60 per cent to 2½ in., not more than 30 per cent from 2½ in. to 1½ in., and 10 per cent to ¾ in. to ½ in., all below ½ in. being discarded.

(6) *Quality of Tar, Pitch, and Tar Oil.*—The tar, pitch, and tar oil proposed to be used shall be in strict conformity with the Road Board Specifications Nos. 5 and 6, for tar No. 2, pitch, and tar oil, copy of which is attached hereto, and samples shall be taken by the surveyor before the work is commenced and submitted by him to a qualified analytical chemist for testing in accordance with the specifications above referred to.

(7) *Drying and Mixing.*—The whole of the broken stone must be thoroughly dried, all dust removed, and heated to about 220 deg. Fahr. before being covered with the tar, and the mixing must be done under cover. There shall be used from 9 to 12 gallons of tar to 1 ton of broken stone, the tar to be applied to the broken stone at a temperature of from 260 deg. to 280 deg. Fahr., as taken in the tar boiler. Mixing must be carried out by an approved mechanical power asphalt-mixer, while the stone is dry and heated, and shall be treated until the entire surface of every stone is covered with tar.

(8) *Laying.*—The respective sizes of broken stone, immediately after mixing with the tar, shall be spread, levelled, and rolled with a 10-ton steam roller, in separate layers, the 2½-in. stone as a bottom layer, and the intermediate layer of 1½ in. in thickness, with a top dressing of ¼-in. chippings, the total thickness being, on all parts of the surface of the road, not less than 4¼ in. thick after the rolling is completed and the surface brought up to the required contour.

(9) *Tarring and Gritting.*—Within two months of the carriageway being complete as above and used by the traffic, the surface shall be carefully cleansed, and afterwards sprayed with boiling tar as specified, and gritted with granite chippings from an approved quarry gauged between ¼-in and ⅛-in. square meshed screens, to the extent of 1 ton of chippings to 300 to 350 sq. yds. of surface of road.

DISCUSSION OF MR. BRODIE'S PAPER.

Mr. E. J. Elford (Southend-on-Sea), speaking with regard to the suggested scale of traffic intensity, said he thought there was a great deal to be said for an innovation of that kind, and no doubt the matter would be dealt with by the Engineering Standards Committee. The suggested first clause of the specification seemed a little dangerous, for a number of items of information must be based on individual opinion, and he thought it was better to leave more to the judgment of the contractor. If they attempted to give such definite information, they provided the unscrupulous with opportunities for creating trouble. In regard to the sub-foundation, it might be useful in some subsoils to roll the foundation first, but with a light subsoil rolling would be dangerous. In regard to the stone for tar-macadam, he disagreed with the suggestion that limestone should be employed. He had never been able to get a limestone that would carry the steam roller. As to laying the material, his opinion was that, instead of laying the different sizes in separate layers, it was much better to have the gauges for the material properly mixed, so that they got a bituminous compound. With reference to the subsequent drying and gritting, he would suggest that, instead of saying this should be done within two months of the completion of the carriageway, it would be better to specify that the drying should take place after two months and within four months. His experience was that a tar-macadam road in the first two months of its existence closed up under traffic, and it was dangerous to start dressing the surface of a road until it had thoroughly set.

Mr. A. J. Price (Lytham) said he could not help thinking that the roads Mr. Brodie had at Blackpool had not all been carried out according to the specification which he had laid down in his paper. The roads themselves were very good indeed—the road on the front was one of the finest in the country—but he did not think they were all laid according to this specification. As to rolling the foundation, it would be an impossibility in a great part of his district, and practically the same conditions obtained in Blackpool. There were places where they would run the risk of losing the roller altogether if they used a roller in such weather as they had had during the past few months. Then, again, with regard to the period of construction. Mr. Brodie suggested January to April. He did not know why. In seaside towns they tried to get all the work done out of the season; but he would do no tar-macadam work, if he could avoid it, between January and April. When they had private street works they had to do it practically all the year round, but they wanted warm, fine weather for it. With regard to the watering of the foundation, he had made about eighty new streets since he had been in Lytham, and, of course, Mr. Brodie had made a great many more, but he had never watered the foundation. He used hand-picked sandstone for a rubble foundation, and if he was going to put tar-macadam on the top of that he did not see the necessity of watering. He would not use sandstone when he could get granite or limestone, which was as good as most sandstone. With regard to rolling, he had been trying to get his committee to go in for a small motor roller. In one part of his district the sewers were not very deep, and though all the sewers were surrounded with concrete he was not very sure that a 10-ton roller on these streets would not damage the sewers. The road on the front at Blackpool, which was one of the finest in the country, was very largely done with a 4-ton roller.

Mr. Brodie: Both a 4-ton and a 10-ton roller.

Mr. Price, continuing, said, with regard to the quality of the tar, that if he were to get all his tar to the order of the chemist, he would get the "sack." He got his tar from the gasworks which adjoined his storeyard, and he had to take the tar as he got it. It was very good tar on the whole, but there were times, of course, when they got a good drop of water with the tar. It was all very well to lay down rules and regulations, but they had to be used with discrimination, and there were times when it was better to break rules than to carry them out. There was some tar which they might use on a road which was exposed to the sun and had a good deal of traffic on it, but they would not use that kind in a back street where was neither sun nor much traffic. The tar they used in a street where traffic was heavy and the sun was strong wanted to be more of a pitchy nature than that used in a back street. Generally speaking, he used all distilled tar. He never used pitch if he could avoid it. As to drying and mixing stone, he dried as little as he could artificially. He preferred to strew the chippings so as to let the sun get on them, because that was much more economical, and also because if they put stone on a dryer it was very liable to get too hot and convert the tar into pitch. With regard to tarring a finished road within two months, he did not quite see the necessity for that. He had done a good bit of granite tar-macadam work, and he found granite did not take the tar quite so easily as limestone. But for heavy traffic he did not care to use limestone; it made a dusty road. Granite, on the other hand, would practically carry traffic without any watering at all. He had a main road which had been tar-painted, and the watering cart was never on it from one year's end to the other, and it was the road on which all the motor traffic went through from Preston to Blackpool.

Mr. E. Willis (Chiswick) observed that the author suggested that contractors should have opportunities of dealing with certain matters in other ways than those of the specification. He thought that was an excellent idea. He had carried it out in his practice—not only in tar-macadam, but in other kinds of work. It gave the contractors more interest in the work, and put them on their mettle. With regard to standardisation of traffic, that was a thing which they would all like to have, and the sooner the Standards Committee could deal with it the better. He was sorry to differ from Mr. Elford as to Clause 1 of the general draft specification, but he quite agreed with giving the contractor information which was definite and certain. They all knew that in every contract there must be certain conditions affecting it; by all means give those conditions, and then everyone stood on the same footing. He did not think any surveyor round London could give definite information with regard to foundations of roads. He had been content with any suitable material he had in hand, and he had found a vitrified foundation of broken bricks give good results. But the foundation of roads should be largely subject to discretion. He had had experience of a long arbitration with regard to foundation, and he was glad to say that his council came out successful. He had found tarred clinker successful for light-traffic roads, especially when treated on the top with fine granite chippings.

Mr. A. E. Prescott (Eastbourne) submitted that it was not possible to standardise any system of road making at present. He thought Mr. Brodie admitted that, but much depended on local conditions and circumstances. There were one or two points on which he was not in harmony with Mr. Brodie. One was the use of the 10-ton roller on tar-macadam. He con-

sidered a roller of that weight much too heavy. The practice he had adopted was to roll with a light roller, allowing the metal to get a certain amount of cohesion, and from that method he had obtained very good results. He had not used any tarred clinker, but he had no doubt some surveyors found good use for it. For secondary roads he believed it was very suitable.

Mr. O. E. Winter (Hampstead) said he considered that sufficient accuracy was not observed in the description of materials used in road making. Tar was not asphalt, and asphalt was not tar. He had had excellent results from tar-macadam, but he thought there was plenty of room for the use of asphalt and bitumens in connection with roads with considerable traffic.

Mr. W. Nisbet Blair (St. Pancras) said he had taken a good many observations, and he thought they ought all to work under one uniform method. To reduce figures actually taken to a certain rate per annum was misleading. Mr. Brodie proposed that traffic be always expressed in tons per annum per lineal yard of width of roadway. Most of them were content to take traffic over a period not longer than seven days, and many took traffic on one day at one season, on all other days at another season, and to calculate that traffic per annum would convey as much as if they had recorded it per yard per day of eight hours. From his experience they got nearly the whole traffic between 8 a.m and 8 p.m. That, of course, might not be accurate in special circumstances; for instance, in London they got a heavy night traffic to the railway stations, and in such cases it might be necessary to take the traffic for twenty-four hours. Should the night traffic equal the day traffic, it might be reduced to tons per foot in width per hour. He thought, however, that they would get an accurate result if they took the traffic from 8 a.m. to 8 p.m., and reduced it to tons per foot of road. They would then be able to compare one street with another and one district with another. Another important distinction was that between rubber-tyred and iron-tyred traffic. He had two tar-macadam roads. One was a failure and the other was a success. They had had another twelve months' traffic on the road which was a success, and it was still a success. That road was still perfect, carrying a traffic of over 600 vehicles per hour. It was the approach road to Euston Station, and it ran great risk of being spoiled, as it was made in showery weather.

Mr. W. Jones (Colwyn Bay) stated that the sheets on which the records of the traffic taken in his district were entered had been issued by the Road Board, and he felt sure that if these were used generally throughout the country they would give a fair criterion of the traffic. The streets were most carefully drawn up, and although they might be slightly altered, there was no real necessity to depart from the standard laid down. They were published by Messrs. Waterlow & Sons. If surveyors generally would adopt these forms they would have uniformity in the matter.

Mr. W. Stubbs (Blackburn) said the only suggestion he had to make was that where the subsoil was clay it was a mistake to use pitch on it. He would advise filling in the interstices with broken millstone grit, roll it in and water it, after putting on 4½ in. of limestone as suggested. There was no difficulty in rolling limestone; it was as easy to roll as any granite. He did not, however, use limestone on main roads, or for any roads carrying very heavy traffic. They had very large boiler works in the town, and from these works they sent away boilers of 40 tons weight. They had come to an arrangement with the proprietors of these works under which they had the wheels of their lorries wooden shod. Since that had been done they had had no complaints of setts being broken. Previous to the adoption of that system they had sent in a claim to these makers for £2000 for two journeys, a big boiler having made a groove the whole way.

Mr. G. W. Lacey (Oswestry) inquired whether Mr. Brodie could state some means by which with reasonable accuracy the character of traffic along a road could be ascertained. It was a comparatively easy matter to obtain the number of vehicles and the various kinds of vehicles, but to ascertain the weights of rapidly moving loads of altogether different descriptions was almost an impossibility. He could not see how the [illegible] tons per hour with any reasonable degree of accuracy. The sheets of the Road Board were very useful for traffic estimation. He had had occasion to use them, as they had been making an application to the Board for a grant. There was the question of broad-wheeled and narrow-wheeled traffic; the effect of each on the roads was quite different. Again, the character of the traffic in one district was not comparable with that of the traffic in another. As to the specification, there were points with which he agreed and others with which he could not. There was no question that for taking the tar well and making a close and compact road no stone was equal to limestone, but it could not compare with granite in other respects. They had a few sections of granite tar-macadam laid in Shropshire, some of which had been very good and some very bad. There were instances of granite macadam showing most excellent results, but the traffic conditions were quite different from those which prevailed at Sidcup, where the trials were being made. What might last twelve months at Sidcup they would expect to last three, four or five years in Shropshire.

Sir George Gibb, chairman of the Road Board, remarked that this was a very technical subject, and, as they were aware, he had no technical experience; however, he would say a word on statistics, about which he did know something. He was glad that the Road Board form had been referred to with approval. A great deal of trouble had been taken in preparing it, and they did the best they could to provide a form which would suit a variety of conditions. Of course, in classification they could not reproduce all details; they must classify on some group and some average. Although it was quite impossible to reproduce in the tonnage figures the exact tonnage that passed over a road, still it was wonderful how true the averages were, and how near to what the actual working would give. Therefore it was quite useful to employ the figures of tonnage on a computed basis, and he would suggest that the basis of computation used by the Road Board be generally adopted. The forms were prepared by men, all of whom had experience of different kinds of traffic. He was not sure that he liked the idea of dividing the figures into very small units. What they had to aim at in classification was to get accuracy as near as they could. On the question of accuracy was it really a fact that the difference between a 6-yds. and a 7-yds. road was substantial? If they had a certain quantity of traffic composed of different classes of vehicles on a road 6 yds. wide, and they had the same quantity of traffic on a road 7 yds. wide, was the wearing effect on the road in the one case one-sixth more than it was in the other? He had no right to suggest an opinion on that; he put it to them as a query. Still, he confessed he was sceptical, and he rather thought if they got the traffic in tons per day, while dividing it by the width of the road in yards, they got a figure that was accurate in itself, that was easily memorised, and a figure which was true within certain variations of width. Probably if they reduced all figures to tons per yard of width they got a statistical figure which was almost too minute for the rough-and-tumble of ordinary use. Then, again, if they reduced it to per hour or per annum, in the one case they got too small a figure and in the other case too large. His inclination was always towards a simple figure—the number of vehicles per day. So as they got at the number of tons per day, then they had figures which, he thought, would be found adequate.

The President (Mr. R. J. Thomas) said one factor had been omitted in considering the volume of traffic, and that was that the less the volume of traffic on a given road the greater was the proportion of that traffic using the centre of the road. They could not compare the traffic of a heavy street with that of an ordinary 18-ft. country road. What the country surveyors had to face was the universal user of the centre of the road. Some years ago he made careful tests on the main country roads leading out of Aylesbury, and he found that on the central 7 ft. of that 21-ft. country road there was three times the amount of traffic that there was on the haunches. If that was so ten years ago, how much more would be the case now, and he suggested that it was of the utmost importance in [illegible] the factor of traffic to bear in mind the class of traffic and the extent to which it was able to keep to the centre of the road.

Mr. Brodie, in reply, said the main points of the discussion appeared to have taken the direction of traffic enumeration. He had no doubt they might well have a paper devoted entirely to that part of the subject, so great was its interest and importance. He had himself taken some trouble during the past two years to obtain reliable information with regard to the traffic on some of the roads in his district,

and he had taken the traffic on the first working day of every month for two years. In a place like Blackpool the traffic at this time of the year was more than 100 times what it was in January or February, therefore figures taken now or in the depth of winter would give no idea of the volume of traffic using the roads. Mr. Price referred to the specification, and suggested that it was not quite in accordance with his (Mr. Brodie's) practice. He could assure Mr. Price that the Marine Drive-road, which was nearly level from end to end, and was 40 ft. in width, had been constructed on the lines laid down in the paper. Singularly enough, no one put the question to him what the cost of a road made to the specification would be. All the work was done under contract, and the cost was at the rate of 1s. 9d. for the rubble foundation, and about 2s. 6d. for 5 in. of asphalt on the top. They thus got a total cost of about 4s. 3d. per square yard. As to rolling with a 10-ton roller, it was true that part of the road was finished with a smaller roller—4½ tons. He left that to the judgment of the contractor. The whole work was done in a way which was very creditable to the contractor, so much so that very little had been spent on it during the seven or eight years it had been laid down. He thought if they were to give a contractor a fair chance of making roads successfully, they must give him the most reliable statistics possible to work upon. He quite agreed with Mr. Winter about the somewhat loose way in which the word bitumen was used, and he would be obliged to the Road Board if they would simplify the nomenclature. What he meant was tar-bound or pitch-bound roads.

(To be continued.)

WORK OF THE ROAD BOARD.

SECOND ANNUAL REPORT.

The second annual report of the Road Board, which was issued on Tuesday night, states that the income of the Road Improvement Fund in respect of the period from the constitution of the board in May, 1910, up to March 31st last, was £2,181,312, made up as follows: Motor spirit duties £1,292,860, carriage licence duties £863,536, interest from investments £27,916. The grants and loans made and indicated during the same period to county councils and other highway authorities amounted in the aggregate to £1,177,438, and in addition thereto the board have intimated their willingness to grant £875,000 to assist the construction of a new western approach road to London.

The board state that they have adhered to the policy indicated in their first report in selecting the works of road improvement towards which their first efforts are being directed, and the grants and loans have been apportioned as follows: Improvement of road crusts, £446,772; road widenings and improvement of curves and corners, £56,833; road diversions, £18,276; reconstruction and improvement of bridges, £15,128; new roads and bridges, £4,928; total grants and loans, £541,937.

The expenditure on roads by county councils in England and Wales for the year ending March 31st, 1909, is given in order to show the field of choice open to the board. This shows that £2,643,044 was the maintenance cost for 27,802 miles of main roads, while £63,162 was spent on "improvements." The board, however, think this is probably an understatement of actual expenditure on improvements, and that certain items classed as "maintenance" might prove to be more properly charged as improvements. The board point out that grants cannot be made towards expenditure on maintenance, and say "the purpose of grants is to assist improvements, and as the law now stands it would be improper to use them as a means of redressing inequalities in the burden of maintenance expenditure in different districts."

TWO PROBLEMS.

The report says: "There are two distinct problems connected with roads, each of which has a different origin, and requires a different treatment. One of these problems arises from the growth of population in cities, towns, and other urban areas. This growth has led to the necessity for extensive reconstruction of roads and streets in order to provide for the greater volume of traffic, chiefly local, which has caused congestion at many points in urban districts, requiring for its remedy either the construction of new streets or the widening of existing streets; but the substitution of motor traffic for horse-drawn traffic has tended not to increase but rather to relieve this congestion. The other problem arises directly from the introduction and rapid increase of motor traffic, and is concerned chiefly with roads passing through rural areas and inter-urban roads, the crusts of which were, and still are, over a very large mileage insufficient in strength and unsuitable in character for the use of such traffic."

There is a general impression that nearly the whole of the increase in maintenance expenditure which has taken place has been due to motor traffic, but although such traffic has already been responsible for a considerable increase in the cost of maintenance of roads in rural areas, it is doubtful whether this cause has yet affected the figures to as large an extent as it may do in the future, unless prompt and effective steps are taken generally, as has been done in several counties, to arrest the increase, by adopting better methods of maintenance.

So far as improvements either in road crusts or widths of roads in urban areas are concerned, the board says they will have to be carried out without the assistance of the road improvement fund for local purposes, and the opinion is also expressed that it is most unfair that the cost of such local needs should be provided from local resources. There is a very general impression among highway authorities that they ought to get more assistance than they get from exchequer contributions towards the increasing maintenance expenditure, and they do not yet fully realise that the Road Improvement Fund is not a fund for the relief of maintenance expenditure.

ROAD CRUSTS.

Owing to the neglect of road maintenance for many years prior to the passing of the Local Government Act, 1888, there was at the date of the Act, and is still throughout the country, a very large mileage of important roads, the crusts of which are much below a proper standard of strength, and even in those cases where roads have for many years been properly maintained for the requirements of horse-drawn traffic the surface coatings of the bulk of the mileage are found of water-bound gravel, flint, limestone, sandstone, or other inferior stone, and are wholly unsuitable for motor traffic.

The board expresses the opinion that the roads not originally strongly constructed have suffered damage from heavy motor traffic out of all proportions to the number of such vehicles using the roads. Consequently, in such cases the problem to be faced by highway authorities is most serious, and a very large expenditure must be incurred on road crusts. The board is of opinion that it will be greatly to the advantage of highway authorities, and will also enhance the benefit to be derived from the existence of the road improvement Fund, if highway authorities will undertake, with the assistance of loans, a larger amount of recoating work than they are able to accomplish immediately out of rates. The board is prepared, so far as funds permit, to advance such loans, in most cases without interest, for the extra cost of road crust improvements which are likely to increase the life of surface coatings in a greater ratio than the cost.

THE WESTERN APPROACH ROAD SCHEME.

Referring to the proposed western approach in London, which was estimated to cost £1,750,000, the board states that negotiations are going on with the London County Council. It would, they think, be inadvisable to take up other schemes involving any large expenditure, either in London or elsewhere, until a final decision has been arrived at with regard to this scheme, which they regard as one of the most desirable works of its kind in the public interest at the present time.

Ripley's Sewerage System.—Arising out of the medical officer's report on the health of the district, the Local Government Board have written to the Ripley Urban District Council asking the council to consider the question of providing sewerage arrangements in the lower Hartshay district. It is pointed out that, although the council had been granted powers under the Public Health Act, only seven conversions of pail-closets to water-closets were shown for the year. The board consider it desirable in the interests of public health that these should be more extensively adopted, and desire the council to consider the question of a general scheme of conversion, which would reduce the cost of scavenging by 7s. 3d. per house.

PUBLIC HEALTH IN JOHANNESBURG.

REPORT OF MEDICAL OFFICER.

The report of the medical officer of health for Johannesburg, Dr. Charles Porter, for the two years 1909-10 and 1910-11 has been published as a closely-printed foolscap document of 76 pages, with numerous statistical tables and three appendices. In his introductory letter, Dr. Porter remarks that the preparation of such reports is always a matter of very considerable labour, and in Johannesburg has frequently to stand aside for considerable periods, owing to the continuous and insistent pressure of daily work.

According to the municipal census of October, 1910, there were then in Johannesburg 220,304 persons, including 111,857 Europeans, 95,512 natives, 5,176 Asiatics, 7,749 Eurafricans—*i.e.*, persons of mixed European and African blood.

The death-rates per 1,000 of the various sections of the population were as follow:—

	Gross recorded.		Excluding non-residents.	
	1909-10.	1910-11.	1909-10.	1910-11.
Whites	12·5	14·4	11·3	13·3
Natives	24·5	33·6	23·1	32·5
Eurafricans	25·2	31·1	24·7	29·5
Asiatics	18·5	19·7	17·5	19·1
All persons	18·3	23·4	17·0	22·3

In 1910 the death-rate per 1,000 in London was 13·4, in Glasgow 15·1, in Dublin 19·9, Paris 16·7, Berlin 14·7, St. Petersburg 24·1, Cairo 39·7, New York 16·0, Buenos Ayres 16·5, Sydney 10·4, Brisbane 11·1, Durban 6·6, and Capetown 10·7.

TYPHOID FEVER.

The record in this matter is probably the most satisfactory feature of the report, as not only do the mortality figures show a decrease of 40 per cent, but there has been a steady decline in the number of cases, and the case-mortality has not been unduly high.

WATER SUPPLY.

Some 656,000,000 gallons were supplied by the Rand Water Board in 1909-10, and 707,000,000 in 1910-11, a large increase over former years.

The water from the western series of wells at Zwaartkopjes has been satisfactory, but, as in previous years, the bacterial content of the water from the southern section has varied considerably, and as the wells in question can no longer be considered in the developmental stage, these variations have, at times, been a source of considerable anxiety. Before, however, recommending that filtration of the water, with its attendant expenses, should be undertaken, it was decided to try the effects of treating the water with a solution of chlorinated lime.

The chief engineer of the Rand Water Board at once adopted the suggestion of the medical officer of health that a small quantity should be added, as has for some time been done with much success at New Jersey and other places. After some preliminary trials, he designed a very simple arrangement for adding the solution of chlorinated lime continuously and in the requisite proportion to the large "mixing well" at the end of the southern section.

This chlorinated lime is added in the form of a solution of 1 in 164—that is, 15 lb of $CaOCl_2$ (containing 33 per cent of available chlorine) are dissolved in 180 gallons of water, which are added to each 1,000,000 gallons of water pumped.

Difficulties were, of course, experienced at first in getting the right proportion of the chlorine solution added, and it was found necessary to modify somewhat the original arrangement, but the method now in force appears, on the whole, to give satisfactory results. At the commencement complaints were occasionally received as regards the taste of the water, and at one time the question of employing some de-chlorination system was considered, but subsequent experience has not, up to the present, necessitated further action being taken.

The temporary arrangement for the softening of the water at Zwaartkopjes has not proved satisfactory, and it is hoped that the Water Board may see their way shortly to adopt a system which may be relied upon to give better results.

Other special subjects dealt with in the report include aërated water and ice factories, sewerage, sewage disposal, and mine sanitation, the medical officer of health remarking that as regards mining property within the municipal area of Johannesburg there is none of the opposition to necessary sanitary improvement with which health officers in English towns are often only too familiar.

SLUM PROPERTY.

Dr. Porter states that there are in certain quarters of Johannesburg, especially in Fordsburg, Ferreirastown, Marshalls, City and Suburban, and Old Doornfontein, a considerable number of squalid dwellings which were mostly erected before the present by-laws came into force, and which are of very poor construction, dilapidated in condition, and crowded in area. At the same time, if tested by considerations such as sufficiency of lighting, ventilation, water-tightness, closet accommodation, and yard space, most of these places, in spite of their unsightly appearance and the other drawbacks indicated, are of such a nature that it would be difficult to get from any magistrate (even if the council had the power to proceed in that way) an order for their closing, much less their demolition. Further, the fact has undoubtedly to be borne in mind that, in calling upon the people to patch up and more or less to renovate these essentially undesirable dwellings, the council would simply be prolonging the life of structures which, in the medical officer of health's opinion, should be swept away. This statement is not, however, made in extenuation of any insanitary conditions which may exist or arise therein. The medical officer of health deplores the absence of adequate legal powers to deal effectively with these conditions, and asks for (1) Legislation on the lines of the English Town Planning Act; (2) provision of suitable locations for all coloured persons; and (3) power to compel such coloured persons to live in locations.

SCHOOL BUILDINGS.

Ten fine new Government schools (primary) were built in 1909-11, to accommodate 3,700 children.

DUTIES AND DIFFICULTIES OF SANITARY INSPECTORS.

The staff of inspectors numbered twenty-five, with one white and two native constables. The clerical staff numbered four. Each inspector has from 1,300 to 2,000 sets of premises to supervise, and the medical officer of health points out that even with great diligence he cannot hope to visit every house oftener than once in six weeks. As many ratepayers apparently expect frequent visits from, and conversations with, sanitary inspectors, the medical officer of health's remarks in this connection are enlightening. He makes it clear that inspectors have many other important duties besides visiting back-yards, and, further, that if they are to be held personally responsible for the condition of every yard at all times their number must be very greatly increased. He does not, however, consider necessary, nor recommend, any such increase, and is of opinion that if a thoroughly efficient refuse-removal service is organised, supervised and properly carried out, there will be no need for increase in the number of sanitary inspectors by more than one permanent addition, which the recent growth of the town has rendered necessary. On the other hand, Dr. Porter is of opinion that the staff of white men (scavenging overseers), to whom is entrusted the actual supervision of the scavenging natives, should be very materially increased, and this the Health Committee has decided to do. He remarks that complaints by sanitary inspectors are of relatively small value, compared to adequate energetic and conscientious personal supervision of the natives who have to carry out this work. If such supervision be exercised there should in future, he thinks, be little necessity for inspectors or anyone else to make complaints.

The medical officer of health warmly acknowledges the services of the assistant medical officer of health (Dr. Stock), and of Dr. G. D. Maynard (who was acting assistant medical officer of health for six months in 1910) of the public health staff. The Government analyst and bacteriologist are also thanked for their co-operation, and the report concludes with a summary of the important questions requiring early attention, namely, those of (1) Slum property; (2) housing of natives; (3) extension of water carriage; (4) the acquisition of adequate legal powers.

The health of the council's natives is dealt with in an appendix, and Dr. Stock is to be congratulated on their remarkably low death-rates of 5·5 and 8·03 respectively for the two years under review.

Royal Sanitary Institute Congress at York.

ENGINEERING AND ARCHITECTURE SECTION.

The first paper to come before the Engineering and Architecture Section of the recent congress of the Royal Sanitary Institute at York was the following:—

THE MODIFICATION OF MODEL BUILDING BY-LAWS.

By Halsey Ricardo, F.R.I.B.A.

By-laws, we all recognise, are made, not for the good primarily of the individual, but for the community. When a building is erected, the first requisite is that it should not be a danger or a nuisance to its neighbours, and, secondly, a danger or a nuisance to its occupants. By-laws are not enacted to check building, but to secure good building. It is a matter of common knowledge that they have failed to secure the latter. In the country, except for the matter of sewage disposal and the protection of the water supply, one might argue that no building by-laws are requisite. Each cottage, or group of cottages, should stand on an adequate area of land, and the owner should be responsible for their proper construction, and for any strictures that the medical officer of health may have to pass on them. The danger from fire is not a great one; the precautions under the by-laws are not really adequate, or easy to enforce, for the occupant can, and does, stultify some of them habitually when furnishing his rooms.

The Public Health Act is to see that he is neither a danger nor a nuisance to his neighbours, and as long as this can be secured efficiently, the rest might be said to be the owner's business. However, the Local Government Board does not take this view, and has promulgated a series of Model By-laws for rural districts which are in force throughout nearly half the country: laws which, when once adopted, the district councils are powerless to abrogate, and which the Local Government Board declines to modify to suit individual requirements. Moreover, the board enjoins on such local councils as may be desirous of having building by-laws a further embroidery of restrictions, specifications and demands, till the original purpose of the Model By-laws is quite overlaid by the numberless provisions and safeguards, appropriate for the most part to urban requirements, or to districts that are in the process of becoming urban. And the local councils are eager to meet this demand from the Local Government Board, on the ground that it relieves them and their district surveyor from a great deal of responsibility; they have the comfort of knowing that these laws are in pretty general use, and that seems an evidence of their suitability; they adopt the plausible theory that a network of cast-iron regulations protects the individual from many petty injustices, and puts the community on an equal plane of health protection. . . .

COSTLY BUILDING.

Meanwhile, under our present arrangement of local by-laws enforced by our county councils, a system has grown up of unnecessarily costly building; this, as a vested interest, the councils are naturally anxious to preserve. Under their own by-laws they have been penalised in their own efforts; they have been made to conform, regardless of suitability, to their own regulations; they have subscribed painfully to a costly ideal of building, and they do not want the competition of a cheaper form of house. That anybody should be enabled to build, subject to sanitary safeguards, but without restriction as regards construction, would appear to them as an intolerable surrender of the restrictions under which they have worked, and to which they have submitted.

There is, as I have said, practically no appeal from the decisions of the county councils. Literally it might appear to be possible, but no individual, at any rate, would be prepared to devote the time and the money to carry up the appeal to the Local Government Board. Their decisions then are virtually final, and confined within the four corners of their by-laws. But these councils are not agreed as to what they consider to be the principles of health and construction. They are required to define, for example, the minimum height of rooms, and for rooms on the ground floor there is a concensus of opinion that they should be at least 8 ft. high. But when you come to rooms in the roof, or partially in the roof, some councils require that the room shall nowhere be less than 5 ft. in height, and 8 ft. to the extent of half the superficial area of the floor; while others (such as Godalming) are content with 7 ft. in height from floor to ceiling to the extent of two-thirds the area of the floor, with a minimum of 4 ft. at the sides. On the other hand, Midhurst, for example (in the by-laws dated 1895), requires the ground floor rooms to be 8 ft. 6 in. high, the bed-rooms 8ft. 6 in., and the rooms partially or wholly in the roof to be 9 ft. for two-thirds the superficial area of the floor. Some councils seem to insist on the ground floors having boarded floors on joists; others permit what is generally the more satisfactory method of having a concrete floor to which the boards are nailed direct, although this is not contemplated by the Model By-laws.

The provision for space around cottages is shockingly inadequate; it is not nearly sufficient for the disposal of the refuse of the house. It is a minimum that possibly has to be accepted in a congested town, but can never be excusable in a rural district.

WINDOWS.

The Model By-laws require that "every person who shall erect a new domestic building shall construct in every habitable room" one or more windows, the sum of which shall be equal to one-tenth of the floor area, and that one-half at least "of such window" be made to open. This regulation appears to be accepted by all the various local councils who have adopted by-laws without question, and also, I think, without due consideration. Adequate light is, of course, essential to every habitable room, but regard must be given to the source of light available for such purpose. The quality of light depends on the aspect of the window, its position in the house, and its position in the room. It is obvious that the quantity of light given by an attic window that has an unobstructed view commanding the south differs materially from that given by a window on the ground floor looking into a backyard to the north. Also the position of the window in the room matters greatly. A window that occurs immediately under the eaves of the roof and low down near the floor cannot give the room as efficiently its quantum of light as a window whose head is a few inches below the ceiling.

No general statement or regulation can meet the case, and to fix a minimum of one-tenth the floor area is absurd. At most you can only say in general terms that ground floor rooms require larger window area than first floor rooms, since their outlook is generally more obstructed by foreground objects; and that not more window area should be provided than is requisite, since windows make the rooms hot in summer and cold in winter, any excess of which is prejudicial to their occupants.

EARTH-CLOSETS.

The Model By-laws decline to differentiate between an earth-closet and a privy. The local councils, as a rule, make the distinction. Some allow an earth-closet within the house; some forbid, and stipulate that it shall be at least 10 ft. away. Now, while this might in some cases be a valuable precaution to take in poor cottage property, it is an extremely arbitrary interference in the case of superior buildings, for there is no question that a properly managed earth system is more sanitary than a water-borne one.

Again, wastes from baths and sinks are far better dealt with above ground than being made to travel through pipes to a cesspool, which is to be constructed according to the Model By-laws to be "impervious to liquid." In other words, you arrange a costly system of traps, pipes, and receptacle to enable you to keep your sewage until it is putrid, and then in that state have to bale it out on the ground; whereas, if it is to go there, it is better to put it there before it goes bad. The Model By-laws go on to say: "He shall also cause such cesspool to be arched or otherwise properly covered over, and to be provided with adequate means of ventilation." This, in my own experience, I find is interpreted to mean that a relief pipe must be provided for the escape of the gas generated in the cesspool. Such outlet is not, in my opinion, adequate ventilation, or even ventilation at all. A stream of air should be passing continuously through the cess-

pool if it is to ventilate it, to be got by providing an inlet pipe as well as an outlet, or, better still, to leave the top of the cesspool wide open, with wooden slats across the opening, to prevent accidents.

But the truth is, we waste too much water in our present sewage arrangements, and where, especially, the amount of ground is limited, we ought to use the dry-earth system more. . . . The provision of a water supply, with its pipes liable to burst in frosty weather, its flushing cisterns not always in working order, traps, ventilation, and anti-syphonage pipes, its underground drain pipes, and the evil insanitary cesspool are all heavy items to put to the other side of the account.

HOLLOW WALLS.

I suppose it is a vain thing to ask the county councils to discourage the use of hollow walls above ground. I consider them a faulty construction, leading to all sorts of subsequent disasters. Their sole excuse, that I know of, is that the outer skin, being separated by a cavity from the inner, protects the latter in case of severe stress of weather from the rain and damp. This is valid in theory, but the theory is largely stultified in general practice. The by-laws should insist on two damp courses where hollow walls are being used, one at the bottom of the cavity and one to the inner wall some 3 in. above this wide damp course, otherwise the wet passing through the outer skin collects at the bottom and is sucked up by the inner skin. Not only ought there to be this second damp course, but there should also be a cement or damp-proof rendering made, weathered to a sharp slope, so that the water that has penetrated into the cavity runs at once away from the inner wall and accumulates against the outer; without this precaution the hollow system is no remedy against damp walls.

But it is far better, and not much more expensive, to build the walls solid, and jacket them with a waterproof outer coat of cement stucco or rough cast. The evils of hollow walls are many. You have a space, if unventilated, full of damp air, in which the ends of your timbers are rotting away. Seeing that your floor joists rest probably on a wood plate (tarred or sanded hoop iron meet this difficulty better), when this decays, the ends of the joists, also partially decayed, drop down some 3 in. or more on to the brickwork. If the space is ventilated it becomes the sanctuary and playground for vermin. This open space, under any conditions, is a conductor of sound throughout the building. The system is bad in construction because the main weight of the roof and the floors comes on the inner wall, which in consequence settles down at a different ratio to the outer, almost unweighted, wall. If the ties are of iron (and even when galvanised they rust under their unfavourable conditions), they meet the strain by bending, and such water as lodges on them drains in consequence towards the inner wall; if the ties are made of stoneware or terra-cotta, not being able to bend, they get fractured. I do not know the reason, but there seems to be a general agreement that the cavity must not exceed 2½ in. It would be just as easy to build the walls with a 5-in. cavity, and less chance of the effect of the void being neutralised by chance lumps of mortar resting on the ties and bridging over the cavity. Moreover, pipes, waste and others, have a way of going wrong as they pass from inner to outer walls, and the hollow space has been known to get filled with foul water and sewage, and as the warmer air of the rooms and the open fires act as a pump the bulk of these effluents were sucked into the inner wall.

If the councils are going to insist on minutiæ of construction, as they do when they specify the scantlings of roof timbers and floor joists, and their distance away from smoke flues, they should carry their insistence still further: they should require that the walls over the mantelpiece and at the sides of the chimney breasts should be 9 in. thick where the flues occur; that the external faces of the chimney stacks, where they emerge from the roof, should be at least 9 in. thick; that all skirtings should preferably be in cement, and where the question of cost may render this impracticable the plaster must be carried down behind the wooden skirtings flush with their backs. In the usual building methods the space left affords a run for vermin, and in case of fire adds materially to its power of spreading, where plastered wood partitions occur. This open communication between two rooms, or passages and rooms, carries the fire from one part to the other, and feeds it with the necessary air supply. The councils' by-laws generally specify the scantlings of the roof rafters and floor joists, in several cases regardless of what the nature of the wood to be used may be. It would be better, if they must be so particular, to content themselves with specifying the sectional area; but why do so at all? As it is, by prescribing the minimum (which is really too little for inferior timber) the by-laws set a kind of standard, both in masonry and carpentry, so that any architect who exceeds the minimum is held by his client to have committed an extravagance.

On the other hand, by insisting on footings to every wall where concrete foundations are supplied, they create in many cases an expensive obstruction of no constructional value. If the concrete is thick enough, the walls may just as well rise from it their natural thickness, and it is often cheaper to build the walls in concrete, below the ground level, than in masonry or brickwork. The footings take up a lot of valuable floor space, and are a permanent nuisance.

CONCLUSION.

My conclusion then is that, though the Model By-laws issued by the Local Government Board for rural districts require amending in the article of window area, and bringing up to date in the matter of its provisions for the drainage and sanitation of buildings, they are in the main sufficient; and if they had been accepted by the county councils without any glossary there would not have been this dissatisfaction and outcry. It is true it would have made the position of the district surveyor more responsible, but their relief from responsibility is not a wholesome element, and it leads in many cases to hardship and absurdities. And with all these doctrinaire prescriptions and restrictions, shoddy buildings are being erected all over the country, which, I believe, would be almost impossible if the surveyors had a freer hand in their examination of the plans submitted for proposed buildings.

DISCUSSION OF MR. RICARDO'S PAPER.

Mr. H. D. Searles-Wood, F.R.I.B.A., in a communication on the subject of the paper, wrote: The Model By-laws issued by the Local Government Board for use in rural districts only deal with—(*a*) structure of walls and foundations for purposes of health, and not of stability; and (*b*) sanitary matters. Even if the by-laws have not secured good buildings they have checked bad buildings, and this was their main object. There are no fire prevention clauses in the rural Model By-laws. The Public Health Act has a far wider scope than the author indicates, and in the matter of streets and buildings the principal object is to protect the public. District councils are not powerless to abrogate their by-laws. The Local Government Board does not decline to modify by-laws to suit individual requirements, as is seen in the circular letter of January 5, 1906. The Local Government Board do not enjoin unnecessary restrictions, specifications and demands on local authorities. With regard to the statement that "the local councils are eager to meet this demand from the Local Government Board," there is no demand from the Local Government Board. County councils have no power to make by-laws. There are no restrictions as regards construction in rural Model By-laws. There is no power of appeal to the Local Government Board, and the Local Government Board have no power to give a decision. A magistrate's decision is final unless carried to a higher court. The Local Government Board are, however, very frequently appealed to, and have secured modifications in numerous cases in consequence. Councils are not required to define minimum height of rooms; it is purely optional. The clauses relating to height of rooms in the Midhurst by-laws were repealed in 1902, and another by-law substituted requiring 8 ft. and 9 ft. for superficial area of floor. Solid floors are provided for in Model By-laws. It would be inconsistent "for purposes of health" to require a larger area of space round cottages in a rural than in any other district. The fault, if any, is in the Act. With regard to the requirement of one or more windows, the sum of which shall be equal to one-tenth of the floor area, that is not excessive under any circumstances. Too much is better than too little. The fashion of small windows is largely disappearing. The Model By-laws (urban) allow an earth closet within a building, and differentiate between the earth-closets and privies. There is no power to enforce the use of movable receptacles or of earth. A distance of 10 ft. for privies from a house is not a hardship. It would obviously be undesirable to allow open drains in small back-yards, or open cesspools. There is now power under the Act to make by-laws as to water supply, and hence their omission. The Public

Health Act gives sufficient power to prevent the occupation of houses without a proper water supply. There is nothing in the rural Model By-laws to prevent timber buildings being erected, or the use of thatch. It is impossible to prohibit the use of hollow walls. With regard to the suggestion that the councils should require walls where the flues occur, &c., to be 9 in. thick, this would rather add to the cost of cottage building. The by-laws always define the timber from which scantlings are given. The sectional area is not a sufficient method. The strength varies according to depth and width. There are no clauses as to footings in rural Model By-laws. Footings are not prescribed to be of brickwork, and might be of concrete. The by-laws require only 4 in. of concrete under buildings, which is hardly sufficient to carry a heavy wall. There are clauses specially prepared to deal with housing provided for transitory labour, and local authorities have power under the Public Health Act, 1907, to license temporary buildings for this and other purposes.

Mr. G. W. Lacey (Oswestry) said the communication of Mr. Searles-Wood had practically cut the ground from under other people's feet in attempting to criticise the paper. There was no doubt this was a very difficult subject, and one could agree that a remodelling of the by-laws both as to urban and rural districts might be advisable. There was no doubt that there were things in the by-laws in many districts which were not up to date with present methods of construction. Unquestionably rural conditions should be more taken into account than they had been. It was within his knowledge that the by-laws in some rural districts were even more stringent than those in the urban districts adjoining them, and there was no sense or reason in that. Mr. Ricardo seemed to think that it would be sufficient to have some very generalised treatment, and to leave a good deal of detail to the architect and builder, but he was afraid that would produce considerable difficulties in administration. There must be laws of control, and there must be obedience to them, for without obedience to the law they would have a state of anarchy. As to the question of a cheaper mode of construction, that was an important point in view of the enhanced price of materials. It might be advisable to cheapen construction, but a cheaper class of building would entail more for maintenance, and perhaps the old adage that the best was the cheapest in the end would apply in this case. There were no doubt many inconsistencies in the by-laws, and these should be removed where necessary, but these could only be ascertained by investigation. There must be a minimum fixed, and the danger was that it might be fixed too low. What was put as the minimum was too often regarded by people as the maximum and they did not set themselves to go beyond the actual requirements of the law. He considered particularly that the by-laws with regard to the air space about buildings required to be remodelled. He held that where there was not sufficient development to warrant the preparation of town planning schemes, great good might be attained if the model by-laws were framed so that a greater amount of air space should be given at the rear or the side of houses in urban districts than was the case at present. His contention was that houses should not be permitted to be built in long rows of fifty or sixty without a break for the circulation of air. With reference to the concluding paragraph in the paper as to the asking of too much causing danger of a neglect of sanitary laws he was afraid that by asking for too little the evil would be greater.

Mr. W. B. Pindar (Rural District Councils' Association) said the author appeared to have an extremely hazy idea as to the authorities charged with the administration of the by-laws in rural districts. He took it that the author's complaint was not so much against the Model By-laws of the Local Government Board as against the by-laws adopted in particular rural districts, which were considerably more stringent than the Model By-laws. It was a treat to him to attend a meeting where the rural district council was given the credit for being somewhat in advance of the statutory requirement, because the complaint generally was that they were behind the times and very slack. With regard to the air space about cottages, they ought to keep clearly in their minds what the object of land being attached to a cottage was. It was not for the disposal of refuse, but simply to secure free ventilation and light to the building. There was no power, so far as he knew, to make any by-law to provide land for the disposal of refuse, and the proper remedy was to enforce the clauses of the Public Health Act, which empowered the Local Government Board to call on the local authority to undertake the disposal of refuse. As to water supply, that was dealt with under the Public Health Act, and it was illegal to occupy any cottage erected since that date in a rural district unless there was a sufficient and adequate supply of water available for the inmates of the dwelling. He thought that the effect of the by-laws in restricting building operations had been grossly exaggerated. There was at present something like 200 rural districts in England and Wales where there were no building by-laws at all, and he had heard that there was a greater dearth of dwellings in those districts than there were in the districts where stringent by-laws were enforced. If that was so, it seemed to him there was no real basis for the complaint that the by-laws in rural districts prevented the erection of cottages. In those districts architects would have an entirely free hand, and a wide field for experiment, and there was nothing to prevent them experimenting in their own materials and according to their own design.

Dr. Tempest Anderson (York) said they were suffering very much at the present time from an epidemic of grandmotherly legislation, and if they went on as they were doing they would soon have to apply to the sanitary authority for leave to blow their noses. Someone had said there ought to be rigid powers to prevent the disposal of refuse about a house, but that he absolutely disagreed with. When he was in practice he attended farmers who lived with the fields around them heavily manured, and the same thing was the case with market gardeners, and yet they were the most healthy class of the community. When plans were being laid out for the building of a village, it was utterly absurd to spend enormous sums of money in putting down expensive and often abortive schemes for carrying the sewage to be disposed of at a sewage farm miles away. If they had a place in the country where they could dispose of the manure round about the house, and by that means convert it into wholesome vegetables, they would be conferring a great benefit on the community at large. In his opinion the utter waste of manure was one of the greatest national dangers at the present time. They went on exhausting the land, and took the manure which ought to go back to the land, and by septic tank treatment rendered it incapable of being used on the land. That being so, it was absurd to enforce on rural districts by-laws which might be necessary in the big cities, and which, by the way, had been made generally by public officials living in London who had never seen a farm.

Mr. J. S. Munce (Belfast) said that from what had been said that morning one would think the Local Government Board were a set of fools. Instead of crying out at conference after conference about the by-laws, why did they not first agree as to the by-laws they were satisfied with, and then discuss the others? The fault lay with the local authorities and their advisers. Instead of coming there and grumbling, engineers and surveyors should explain the whole thing to their councils, and if they objected to anything, and went quietly to the Local Government Board they would find they would be listened to. In Ireland, if they had anything to discuss they discussed it with the officers of the Local Government Board by arrangement, and showed their reasons for wishing to take a particular course, and they always found the officials most courteous to them. If they sent for a copy of the Model By-laws they would find a space reserved for the making of notes. Why then did they not make the notes and send them to the Local Government Board? His opinion was that the bulk of them were not able to amend the by-laws.

Mr. Cresswell (Carshalton) said, from a perusal of the paper, it would seem as if they wished to go back to the Dark Ages. They seemed to forget that the Local Government Board did not force these by-laws on them. They simply issued the Model By-laws, and each local authority had the remedy. It was the bounden duty of the local authority to consider the local circumstances, and each authority had the right to make its own by-laws, modelled on those submitted by the Local Government Board and approved by the Local Government Board. Speaking as an architect, he would at once say he would be very sorry to think that any brother architect would endeavour to go under the existing by-laws. If he was worth his salt

he would endeavour to go above them, and he had always found that architects did go above them. He had always held that hollow walls were not nearly so good as solid walls. It was a very good thing that a minimum was put in with regard to windows, but he felt that architects would be doing a very bad thing if they got anywhere near the minimum, as it was not sufficient. He agreed with the author as regarded cesspools. He had had a curious experience of adjoining rural districts. In one he had been allowed to put a cesspool with open joints, while a few yards away in another district he had had to deal with it as described in the paper. It seemed to him that the rural districts should come into line. A good deal was said about utilising timber, but a day or two ago a great authority said that they ought to be wary about using timber, as it was not so sanitary.

Mr. Ricardo, in reply, said he was glad the paper had produced so much discussion. He agreed with Dr. Anderson about keeping the manure in the country. In a rural district they had fields all around them. Where they had sewage enclosed in pipes, unless they were kept in efficient order, it meant sewer gas getting into the houses. They could take things into the open air, and not even bury them, and they remained sweet. If the whole country would accept the Model By-laws, subject to bringing them up to date as regarded sewage, and subject to their being a little more reasonable about window space, that ought to be enough. After that, when plans were presented, the local authorities should take on themselves the responsibility of saying they were not adequate if they thought so. It was the taking away of responsibility by putting things into the by-laws which did the harm.

(To be continued.)

SELF-CONTAINED COTTAGES *v.* BLOCK DWELLINGS.*

By J. Wright Mason, M.B., D.P.H.,
Medical Officer of Health, Kingston-upon-Hull.

The problem of how to deal with insanitary properties differs in various towns. In some it may be desirable to pull down the houses entirely and rebuild new dwellings on the sites, while in others it might be possible so to repair and alter the already existing dwellings as to make them reasonably habitable. The latter course is an exceedingly doubtful one, as, in my experience, sooner or later the properties again fall into disrepair, and therefore the action taken does not lead to any permanent improvement.

Buildings of a suitable elevation, and wider spaces between them seem to be a necessity for the future, especially in our large industrial and commercial centres. The essential requirements of every dwelling, however small, in my opinion, should be self-contained, so that the responsibility for their cleanliness and preservation can be fixed upon the individual occupying them. In this class of property each dwelling-house should, as far as possible, be adapted for the class of people by whom it is intended they should be occupied, and in planning them regard should be had to the provision of open spaces to be used as playgrounds and airing grounds. Flats or double-storied buildings are not to be commended, as wherever a common occupancy is resorted to the conveniences and yards attached thereto become more or less neglected, owing to the responsibility being a collective instead of an individual one.

I admit that the easy modes of locomotion provided by municipalities has been the means in recent years of inducing many of our artisans to live in the outlying districts where there is better housing accommodation and less overcrowding, but there remains a class who have possibly no choice but to live in the immediate vicinity of their occupation. Notwithstanding the improvement brought about by the condemnation of dilapidated houses and the clearing of small insanitary areas, the carrying out of this work has undoubtedly led to other localities similarly populated becoming more crowded, and to many of the displaced inhabitants migrating into some of the larger houses which are let off in tenements.

COST OF BLOCK DWELLINGS.

Mr. Aldridge, in a contribution, has stated that the cost of the block dwelling per room in Great Britain and Scotland, apart altogether from the land cost, is higher than the cost of the cottage per room, consequently the accommodation provided for a given sum is less in the block than in the cottage. He further states that the London County Council between 1893 and 1905 erected 3,300 dwellings in blocks, with 8,726 rooms, and the cost of these blocks, erected as they have been in many parts of London, and under a variety of conditions, may be regarded as giving an accurate index to the cost of building blocks throughout London. The building cost per room of these dwellings, apart from site cost, varies from £70 to £140 per room. The average building cost per room prior to 1902 was £102, but as a result of some economies in building methods, the average building cost has been reduced to £92 per room.

The self-contained cottage is, from a hygienic point of view, much superior to the block system. Firstly, the death-rates are lower in the cottage towns of England than in the block towns of Germany; secondly, consumption takes almost twice as many victims from the block dwellings of Germany as from the English cottage home; thirdly, the infant death-rate is far higher in block dwellings than in cottage homes. The building cost per room of cottages varies from £30 to £55 (Alderman Thompson in "Housing Up-to-Date"). These figures prove conclusively that in Great Britain the cost per room in the cottage for both building and site is less than the cost per room in the block.

The block method of housing was introduced into Great Britain in the period between 1850 and 1880, and had a brief period of popularity, the name "model dwelling" being given to this type of dwelling. Outside London, however, the proposal to erect model dwellings failed to secure approval. Manchester, Liverpool and Nottingham, and a few other towns, made experiments of a costly kind in building these dwellings, but the pressure of public disapproval has led the municipalities of these towns to discontinue their efforts in this direction.

Outside London, the block dwelling is to-day regarded as an undesirable method of housing. English workmen and their wives object to it as inconsistent with the English conception of a proper home. Even in London the block is not popular with the workmen, and that great city is still a city of small dwellings. Scotland is the only part of Great Britain in which the block dwelling is extensively found, and even in Scotland the growth of quick means of transit by tram and train, and the advocacy of the garden city idea, are rapidly inducing Scotch builders to erect cottages instead of blocks in the new housing areas.

* Extracts from paper read at the annual congress of the Royal Sanitary Institute at York.

Drainage Works and Sanitary Fittings.—A third edition, revised and brought up to date, particularly as regards the questions of concrete sewers, sewer ventilation and flushing, and the Public Health Acts Amendment Act of 1907, still further evidences the success of this little manual,* which manifestly deserves the attention and confidence of all concerned in the important subject with which it deals.—*The Bookseller.*

Institute of Sanitary Engineers.—On Saturday, the 31st inst., the members of this body will pay a visit to the Linslade Urban District Council's sewage works. Leaving Euston by the 12.20 p.m. train, they will arrive at Leighton Buzzard at 1.45 p.m., proceeding thence by brakes to the works, where they will be received by the chairman of the council (Dr. Johnston Harris, J.P.). At 3.30 the party will make an inspection of the Grove isolation hospital, leaving later in the afternoon for Ascott, where tea will be provided by Mr. Leopold de Rothschild.

New School Buildings at Dewsbury.—The new Batley Carr council schools, Dewsbury, which have cost about £10,000, were opened on Monday last. Messrs. Holton & Fox, the architects, designed a structure which, besides supplying all modern requirements of an elementary school, has an imposing appearance. The schools, which provide accommodation for 500 children, are built on the central hall system. Separate class-room accommodation is provided for each standard, there being six senior class-rooms for boys and girls jointly, and four infant class-rooms. There are, in addition, manual, laundry and cooking rooms, and four separate teachers' rooms.

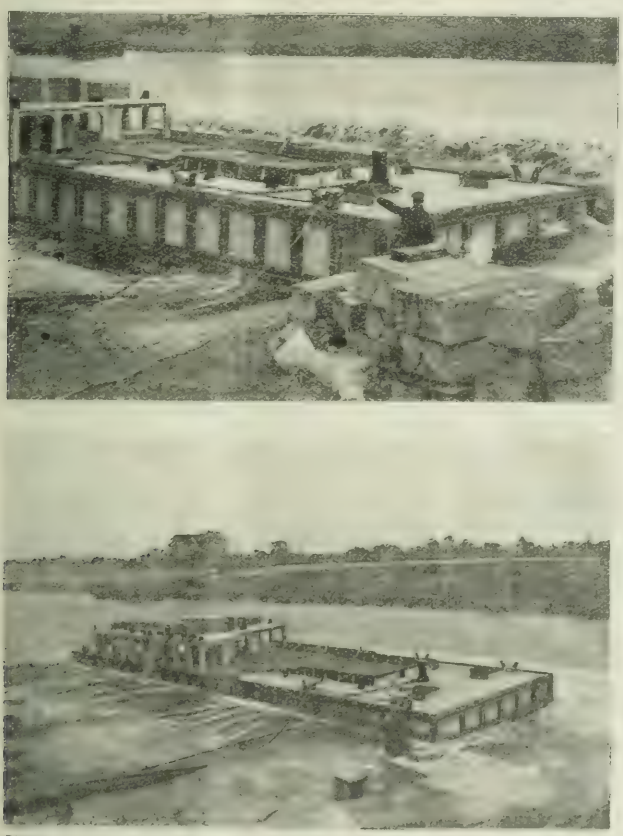
FERRO-CONCRETE SLUDGE PUMPING PONTOON.

Numerous barges and other vessels of ferro-concrete have been constructed abroad during the past few years, but the first example of this class of work to be turned out in Great Britain is a sludge pumping pontoon supplied to the order of the Manchester Ship Canal Company in accordance with the designs of Messrs. L. G. Mouchel & Partners, of Westminster.

The pontoon (says *Ferro-Concrete*) measures 100 ft. long by 28 ft. wide by 8 ft. 6 in. deep from the keel to the main deck. Its construction was authorised by the late Mr. Hubert Congreve, M.INST.C.E., chief engineer to the Manchester Ship Canal, and the contract was entrusted to the Yorkshire Hennebique Contracting Company, Limited, of Leeds. The reasons influencing the adoption of ferro-concrete instead of steel are said to have been the lower initial cost, the elimination of maintenance charges, and the readiness with which repairs could be executed in the event of collision or other accidental causes.



Photos. *A. Waterall.*

Launch of Ferro Concrete Pontoon

An interesting point connected with the safety of the pontoon is that it is divided transversely by two watertight bulkheads—one on each side of the boiler-room—and by three similar bulkheads elsewhere.

The place allotted to the pontoon in the general programme for dredging operations on the ship canal will be clear after perusal of the following statement. The dredgers in regular operation discharge into hopper barges, by which the sludge is transported to points where arrangements have been made for its disposal. The new pontoon has been built for the purpose of enabling dredged material to be deposited on low-lying land anywhere along either bank of the ship canal, improving the quality of the land and conducing to economical disposal. The pontoon will be towed by steam tugs to selected points and there moored, the hopper barges will then be towed from the dredgers as they are filled and moored alongside the pontoon. The suction-pipe of the pontoon will be lowered into the barge to be discharged, and the delivery pipe will deliver material upon the area selected for its reception. The pontoon will remain in position for as many days or weeks as may be convenient, and will be moved from place to place as necessitated by the exigencies of dredging operations.

DERWENT VALLEY WATER SCHEME.

COMPLETION OF WORKS.

The Derwent Valley Water scheme, the completion of which was lately reported, is intended to augment the water supply of Sheffield, Derby, Nottingham, and Leicester, and to satisfy the needs of their increasing populations for many years to come. To this end the head-waters of the river Derwent and its tributaries have been impounded by the construction of dams, the laying of many miles of great pipes, and the carrying out of other engineering devices, at a cost of about £3,500,000. The total gathering area was put down at something over 31,000 acres, and the total yield was estimated at 50,000,000 gallons per day. The arrangement made for the disposition of the water recognised the right of the county of Derby to 5,000,000 gallons per day, of the county of Nottingham to 1,000,000 gallons, and the division of the remainder in the following proportions: Derby, 25 per cent; Leicester, 35·72 per cent; Nottingham, 14·28 per cent; Sheffield, 25 per cent.

The main aqueduct, from the dams to the service reservoir at Ambergate, is 30 miles long. It includes 4 miles of tunnels, 8¼ miles of cut and cover, and 17½ miles of cast-iron pipes. From the service reservoirs the Joint Board controls the mains to Nottingham and Leicester to the boundary of Derbyshire only, the work being thence taken over by the respective corporations. The water passing through the service to Derby, Nottingham, and Leicester is filtered at Bamford, a few miles below the reservoirs.

Lochmaben Water Supply.—The new water supply for Lochmaben was inaugurated last week. The supply is a gift to the burgh by the Provost and Mrs. Halliday. The engineers for the work were Messrs. Balfour, of Newcastle, and the contractor Mr. Simpson, of the same city.

The Lady and the Lamp.—An example of the curious requests sometimes made by ratepayers cropped up at a recent meeting of the Tettenhall (Staffs) Urban District Council, at which the clerk mentioned that he had received a letter from a lady residing at Tettenhall who asked that a public lamp opposite her residence should be removed, as the light shone into her bedroom and she could not sleep. He had replied that the request could not be complied with, as the lamp was one of the most important in the district. A member remarked that the lamp was at the bend of a road, and was one of the most useful lamps they had. The surveyor, Mr. John Denton, remarked that someone had suggested that the house should be turned round. A member said, amidst laughter, that the lady must turn her bed round. The council agreed with the reply of the clerk that the lady's request could not be complied with.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

266. Surveying.—Describe in detail the operation of measuring a horizontal angle with a theodolite. ("Surveyor.")

267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

268. Text-books.—In what text-books can information be found in regard to (1) Theory of earth pressure suitable for reinforced concrete design; (2) Theory of elastic bridges; (3) Methods of taking float observations to ascertain the probable effect of tides on sewage discharged at different positions along shore? (R. W. T., *Gosport.*)

269. Masonry Arch.—Draw the line of least resistance in a stone segmental arch of 10 ft. span with a rise of 2 ft. 6 in., the voussoirs having an equal thickness of 12 in. and each being equally loaded. (A.M.I.C.E.)

REPLIES TO QUESTIONS.

264. Concrete Beam.—A concrete beam reinforced with steel rods is to be designed to carry a distributed load of 20 tons. The span is 15 ft. Show by calculations what size of beam you would use—the method and formulæ to be as simple and short as possible. ("Greenland Farm.")

Let c = compressive stress at top edge of concrete (lb. per sq. in.).

t = tensile stress on the steel (lb. per square inch).
b = breadth of beam (inches).
d = effective depth of beam (inches).
l = span of beam (inches) 180.
n = depth of neutral axis from top edge.
m = ratio of modulus of elasticity for steel to that for concrete, taken as 15.
B = bending moment (lb.-inches).
W = external load (lb.).
A_t = area of tensile reinforcement.
a = arm of resisting moment = $d - \frac{n}{3}$
A_s = area of shear members.
s_s = shear stress on steel
p = ratio of area of steel to concrete.
$B_2 - B_1$ = increment of bending moment between adjacent shear reinforcements.

The maximum values for c and t are 600 and 16,000 respectively.

Neglecting the strength of the concrete in tension the equations are

$$\tfrac{1}{2} c.b.n = A_t.t \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

$$t = \frac{cm\,(d-n)}{n} \quad . \quad . \quad . \quad . \quad . \quad (2)$$

$$n = \frac{mA_t}{b}\left[\sqrt{1 + \frac{2bd}{mA_t}} - 1\right] \quad . \quad . \quad (3)$$

$$B = \frac{c.b.n}{6}(3d - n) \quad . \quad . \quad . \quad (4)$$

$$B = \frac{A_t.t}{3}(3d - n) \quad . \quad . \quad . \quad (5)$$

The beam will have to carry its own weight in addition to the external load. Assuming the beam to be 18 in. × 28 in. its weight at 150 lb. per cubic foot will be

$$\frac{28 \times 18 \times 15.0 \times 1.0}{144} = 7,900 \text{ lb. (say)}$$

$$W = (20 \cdot 2,240) + 7,900 = 52,700$$

$$B = \frac{W}{8}.l = \frac{52,700 \times 180}{8} = 1,185,750$$

If it is desired to use the economical percentage of metal—*i.e.*, to adopt the maximum values for c and t—insert these values in (2).

$$\text{Then } \frac{n}{d} = \frac{cm}{t + cm} = \frac{6.0 \times 15}{16,000 + (6.0 \times 15)} = \frac{9}{25}$$

Now let $A_t = pbd$ and substitute in (1),

$$\text{then } \frac{1}{2} \times 600 \times b \times \frac{9}{25}\,d = p.b.d \times 16,000$$

$$\therefore p = .00675.$$

Insert the known values in (4)

$$1,185,750 = \frac{600 \times 18}{6} \cdot \frac{9d}{25}\left(3d - \frac{9d}{25}\right)$$

$$\therefore d = 26\tfrac{1}{2} \text{ in.}$$

$$A_t = 26{\cdot}5 \times 18 \times .00675 = 3{\cdot}22$$

$$\text{say 5 bars } \frac{15}{16} \text{ in. diameter.}$$

The bars will require at least 1 in. of cover; the over-all depth will therefore be 28 in. and the width 18 in.

These dimensions may be reduced somewhat by adopting a higher percentage of steel. In such case, however, the steel will not be stressed to the maximum of 16,000 lb.

Assume for instance a ratio of reinforcement of $1\frac{1}{2}$ per cent.

First estimate the weight of the beam, say 6,900 lb., then W = 51,700 lb. and B = 1,163,250.

Next determine the depth of the neutral axis by substituting pbd for A_t in (3).

$$\text{Then } \frac{n}{d} = 15p\left[\sqrt{1 + \frac{2}{15p}} - 1\right]$$

$$\therefore \frac{n}{d} = \frac{15 \times 1{\cdot}5}{100}\left[\sqrt{1 + \frac{2 \times 100}{15 \times 1{\cdot}5}} - 1\right] = .48$$

As the concrete is fully stressed use (4), adopting a width of beam (say) 17 in.

$$\text{Then } 1,163,250 = \frac{600 \times 17}{6} \cdot \frac{48d}{100}\left(3d - \frac{48d}{100}\right)$$

$$d = 24 \text{ in.}$$

$$A_t = \frac{1{\cdot}5}{100} \times 17 \times 24 = 6{\cdot}12$$

$$\text{say } 12 - 1\tfrac{1}{8} \text{ bars in two rows of 6 each.}$$

Taking the case of the first mentioned beam, the shear stress is greater than is allowed by the R.I.B.A. recommendations, so that stirrups will be required.

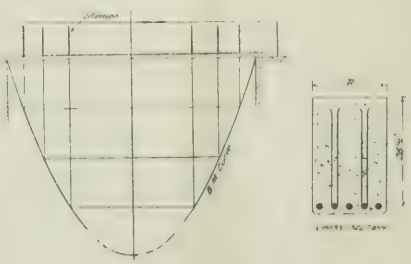
Their area will be

$$A_s = \frac{B_2 - B_1}{s_s.a} \quad . \quad . \quad (6)$$

where s_s = 12,000 lb./in.² and a = 23·3 in.

To obtain their position along the beam plot a diagram of bending moments and divide the maximum vertical ordinate into equal divisions, draw horizontal lines to cut the curve, and from these points of intersection draw verticals to give the position of the reinforcements.

The first stirrup should in this case be placed at a distance of about 12 in. from the support.



$$\text{From (6)} \quad A_s = \frac{300,000}{12,000 \times 23{\cdot}3} = 1{\cdot}1 \text{ sq. in.}$$

say two flat bars $1\frac{1}{4} \times \frac{1}{4}$ bent as shown in the cross-section. (H. F. W., *Tottenham.*)

ROAD MAINTENANCE PROBLEMS.*

By J. George Powell,
County Surveyor of Wiltshire.

One of the chief difficulties of maintenance in this county is that during alternate periods of frost and thaw, when work upon the land is impossible, horses are employed largely upon the roads when the surface is in a condition least able to bear traffic. In the parts of the county where there are large tracts of arable land this traffic is particularly destructive to the road surfaces, which are destroyed, rather than worn out, by the picking up of the metalling by the plastic mud brought on to the roads, sometimes direct from the fields, and in other cases from the occupation roads, which are almost invariably mud ponds in bad weather. I feel I must again appeal to the agricultural community to render all the assistance it can in minimising the damage by cleaning wheels, or hardening the ends of the occupation roads where they come upon the main roads. It most materially affects the cost of upkeep of the main roads, and is consequently of great importance.

SUBSOIL.

The subsoil of the main roads throughout the county varies considerably, and this fact to a great extent is accountable for the heavy cost of upkeep of some roads compared with others. Take, for instance, a road where the subsoil is rock (oolite), marl, or chalk if well covered, and it will be found that the cost of upkeep will be from 30 to 40 per cent less than on another road on a subsoil of clay, greensand, and silt, with the same traffic.

The access of water to a clay subsoil tends to convert it superficially into a semi-fluid mass of soft mud, which is not a desirable foundation for a road to rest upon. The impermeability of clays, however, facilitates the removal of water by proper drainage before it has time to soak into and soften the substratal portions of the road. The worst kind of subsoil to deal with is silt, which, while nearly as retentive as clay, is at the same time very absorptive.

A wet subsoil cannot give a firm unyielding foundation, and will invariably destroy the efficiency of the road under the pressure of heavy traffic. The action of the water will be found to be twofold. (1) The natural cohesion of the road bed will be mechanically weakened, and (2) the chemical disintegration of the road metal will be hastened. When, therefore, the road bed consists of any substance which is liable to become sodden with water, steps should be taken to remove the water by efficient drainage.

HEDGES AND TREES.

For economical and efficient upkeep of roads I attach very great importance to cutting hedges and trees. From experience I have found, where high hedges enveloping, and therefore shading and excluding wind and sun from the surface of the road, have been cut down to the ordinary height of about 4 ft., a saving of from 15 to 20 per cent in the annual cost of repair has been effected. Therefore it is in the interest of every ratepayer in the county to keep both hedges and trees on the sides of the main roads properly cut.

MECHANICALLY PROPELLED TRAFFIC.

I pointed out in my annual report last year that the roads had suffered considerably in consequence of an increase in the number of mechanically propelled vehicles. I again desire to emphasise that fact in respect of this year very strongly.

The increase in the number of self-propelled vehicles since, say, 1903 is great, and the injurious effect of such vehicles on roads is very alarming. With regard to the number before 1903, so far as I am able to ascertain, there were not more than 1,200 motor cars in use, whereas the number using roads in England and Wales on December 31, 1911, amounts approximately to 200,000. Included in this enormous increase in number are some 8,000 heavy motors. To the use of these I attribute the greatest injury to roads. In my opinion greater danger is caused to the surface of roads by the heavy motor than by the traction engine.

Consider for one moment not only the great increase in the number, but the enormous increase in weight and speed the surface of the road has to stand now compared with, say, 1903. Although I have made a comparison, I think it an unfair one; a fairer comparison would be to take 1877 and 1912.

Take the strength and condition of roads in 1877. Although sufficient for the traffic at that time, only about 30 per cent were made roads; the remainder became roads by an annual application of broken metal in the ruts or tracks formed by the traffic on the natural soil. In this way the surface became covered, and eventually a thin crust sufficient to carry the traffic at that time was formed. Between 1877, and more particularly between 1888, and the present date a great improvement to roads has, by a burdensome expense to the ratepayers, been effected, but the fact must not be lost sight of that it was a surface improvement on an unmade foundation. This kind of road sufficed until about 1897 (except where there was heavy traction-engine traffic), but from that date up to the present an entirely new form of traffic has been legalised.

It is inconceivable that measures so drastic should have been passed by the Legislature without inquiry having been made as to whether the roads were capable of carrying the traffic or not. Only a small percentage of them have foundations, and even those by present-day traffic are tried to the uttermost. A great percentage, as before stated, are without made foundations, and these were made and maintained in a sufficient state for the traffic of the county or district. A very great injustice to the ratepayer was undoubtedly done by legalising this new form of traffic. The roads should have been made capable of carrying it by a grant from imperial funds before such traffic was allowed upon them.

This new form of traffic is responsible for the great increase in the cost of road in the county, a fact very regrettable to me, but one which I am utterly unable to prevent. My greatest wish is that I could hold out even a hope that the expenses in the future will be less. A change can only be achieved in one way, and that is by concerted action of county councils and other councils in petitioning Parliament direct, or the Members of Parliament representing each county, praying for immediate legislation in the matter.

MATERIALS.

Owing to there being no material of a mineralogical and chemical nature obtainable in the county—except flints—suitable for the repair of the heavily trafficked roads, a quantity of material continues to be imported. Recognising the fact that carriage forms a great proportion of the cost, I am continuing to use flint on

* Extracts from Annual Report.

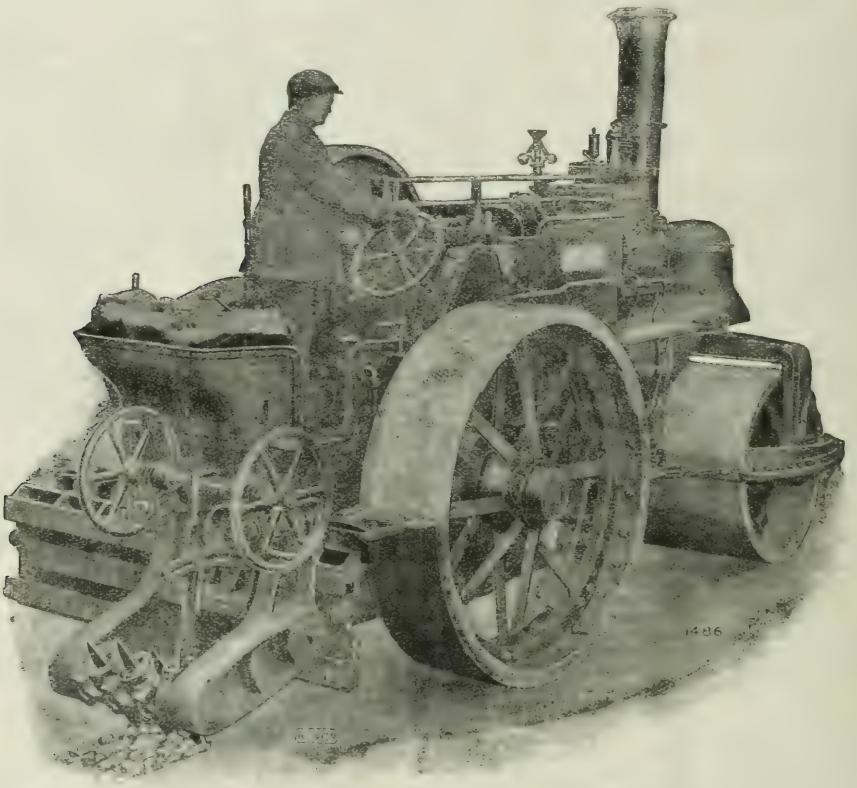
certain roads which hitherto were repaired with limestone. . . . I am of opinion that flints should be used in future on roads which at present are repaired with limestone, for the following reasons: (*a*) A resilient, non-slippery, elastic, quick-drying and clean surface is generally maintained. (*b*) The material is purchased by measure (not as limestone is—by weight), consequently greater bulk, compared with limestone, is obtained. For instance, 1 ton of limestone = about 19 cub. ft.; one yard of flints = 27 cub. ft. Bringing these cubical contents to yards super. of road surface to be metalled 3 in. thick, the following is the result: Flint, 12 yds. super.; limestone, 8 yds. super. The cost of flints is 6s. per cube yard = 6d. per yard super., and the cost of limestone 5s. per ton = 7½d., or 25 per cent per yard super. more than the flint. (*c*) The cost per mile of road would be considerably less. (*d*) Money which is at present sent out of the county would be spent in it.

Scarborough Bathing Pool. With the view of further increasing the bathing facilities, Scarborough Corporation have decided to construct a bathers' pool on the south beach at a cost of £2,600. It will be so constructed as to be available at all times for safe bathing.

Street Cleansing by Electricity.—In several German cities street-washing machines, driven and operated by storage batteries, are in operation (says *Scientific American*). The machine employed is a 3½-ton vehicle equipped with a 40-cell battery giving 200 ampere-hours at the five-hour discharge rate, with travelling speeds of 3, 6 and 9 miles per hour. It carries a heavy tank of water, brushes and rotating rubber scrapers. There are twenty-four of these machines at work in Berlin at present, with six special charging stations, and each machine covers 18 to 25 miles per day, and costs less to operate than a horse-drawn machine.

ROAD SCARIFIERS.

In the latest sectional catalogue of Messrs. Marshall, Sons & Co., Limited, Britannia Ironworks, Gainsborough, one of the numerous illustrations depicts a compound road-roller fitted with the firm's patent scarifier, which is claimed to embody several important advantages over other apparatus of the kind. From the illustration in question it will be obvious that the weight and strain of the scarifier are equally distributed over the full width of the tender. By the traversing motion, scarifying up to the gutter on either side of the road can be done without having to turn the roller round; moreover, the scarifier will operate either backwards or forwards, and the depth of the cut in each case can be regulated. The tools are held rigidly in position, but can be readily withdrawn for sharpening or replacement. The appliance will scarify in one cut about 12 in. to 15 in. wide, and the depth of the cut can be varied from 2 in. to 3 in., according to the nature of the road.



Compound Road-Roller fitted with Marshall's Patent Scarifier.

The catalogue is mainly taken up with the illustration and description of Messrs. Marshall's traction engines and road rollers, but a number of pages are devoted to their trailer and traction wagons, living and sleeping vans, water carts, and useful type of hand-force pumps.

Messrs. Marshall, Sons & Co. have been large makers of engines for over sixty years, having been established since 1848, and the extent of their business will be understood when it is stated that their Britannia and Trent works combined cover over 40 acres, and that they employ more than 5,000 hands.

Institution of Municipal Engineers. The annual meeting of this body will be held in London in October next.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Alfreton U.D.C. (August 8th. Mr. F. O. Stanford).—£1,400 for widening and improving Pentrich-lane, Swanwick, and £700 for the purchase of land adjoining the Butterley reservoir in the parish of Ashover for reservoir extension. With respect to the Swanwick scheme, the clerk gave the following details: £800 the price of land and houses, £25 costs, and £575 the estimated cost of the works. The scheme was a necessary one, because there was a good deal of excursion traffic on the road, which had several dangerous angles. Its width would be from 22 ft. 6 in. to 38 ft. Its proposed width would be from 36 ft. to 52 ft. The surveyor, Mr. R. F. Ward, gave details as to the making up of the road. The footpath on the new side would be a temporary one pending the development of the land abutting as a building estate. As to the reservoir scheme, it was explained that the council had agreed to give £700 for the farm which adjoined the Butterley reservoir, which contained about 14½ acres. With an increasing demand for water the time would come when they would have to extend that reservoir, and the council's proposal was to utilise the farm in question.

Boston T.C. (August 14th. Mr. F. O. Stanford).—£7,370 for the construction of a new town bridge.—The town clerk, in explaining the case for the corporation, mentioned that the county council had promised to contribute £2,000 towards the cost of the bridge. The corporation, it was stated, had arranged to pay £200 for 11 sq. yds. of land at the south-west corner of the bridge, so as to permit of the widening of the structure.

Bridlington T.C. (August 9th. Mr. W. O. E. Meade-King).—£1,600 for the purchase of a house in Manor-street, and for widening the narrow street. The inspector intimated that he had visited the site, and he considered the corner was a very dangerous one, and, as far as his opinion went, he thought the improvement a necessary one. The surveyor, Mr. E. R. Matthews, produced plans showing that when the house was taken down the space would be utilised as far as the passage on the east side of the house. A 10-ft. footpath would be made in place of the existing 3-ft. 6-in. footpath, and the extended roadway would be 24 ft. in place of 16 ft. 6 in.

Bridlington R.D.C. (August 7th. Mr. W. O. E. Meade-King).—£260 for the extension of the water main in North Marine-road, Flamborough, to the Thornwick Hotel, a distance of about 1,100 yds.—It was explained that the existing waterworks were carried out in the years 1906-7. They consist of a well 230 ft. deep, a reservoir storage of 50,000 gallons, a Canadian windmill, with pumps 8-horse power, and a Campbell oil engine attached to three-throw pumps capable of lifting 3,000 gallons of water hourly. There are 4-in. mains in the village, and 3-in. mains outside the village. The whole of the work was done in accordance with a plan and scheme propounded by Messrs. Elliott & Brown, civil engineers, of Nottingham. The supply of water has always been adequate, and the quality good. The existing main is only laid on the North Marine-road to the new property on the north side. The estimate of the engineers for carrying out the proposed extension is for the sum of £260, the following being the details: 1,100 yds. of 3-in. main, £192 10s.; standpipe and two hydrants, £14 18s. 6d.; air and sluice valves, £13; contingencies, £9 12s.; engineers' fees and expenses, £15; loan, advertising, and other expenses, £15; total, £260.

Cambridgeshire C.C. (August 7th. Mr. M. K. North). £6,260 for the purchase of premises in Hobson-street, Cambridge, as a site for county offices, and £9,740 for the erection of the buildings.—It was stated that at present the council work was carried on in a series of scattered offices, the aggregate rent of which was £526. The site of the proposed offices was freehold, and evidence was given that it was well worth the money it was proposed to pay. The county council were not able to make use of the Shirehall, as it was at the extreme end of the town.

Colchester T.C. (August 6th. Mr. A. W. Brightmore).—£820 for works of sewerage in St. John's-street, Crouch-street, Head-street, Eld-lane and Lion-walk.—The borough surveyor, Mr. H. Goodyear, produced plans and specifications.

Fylde Water Board (August 14th. Mr. A. W. Brightmore).—£120,000 for extra expenditure incurred in the completion of the new reservoir at Grizedale Lea, in the construction of which unexpected difficulties have been experienced, and £4,500 for the purchase of land and the allocation of buildings at Blackpool and Kirkham.—It was stated that the reservoir would have a storage capacity of 320,000,000 gallons, and that the area of supply extended over 207 square miles. There was no opposition to the application.

Repton R.D.C. (August 14th. Mr. R. G. Hetherington).—£6,000 for purposes of sewage disposal.—Several members of the parish council opposed on the ground that the brook was not polluted by the present system, Dr. Cronk upholding their contention. Mr. Hetherington inspected the existing sanitary arrangements at the close of the inquiry.

Saddleworth U.D.C. (July 25th. Mr. Courtenay Clifton).—£16,000 for the erection of fifty-five cottages.—The clerk, Mr. E. Rowbotham, stated that the wards in which the houses were to be built were Uppermill, Dobeross, Delph and Diggle. In Greenfield houses were not thought necessary, as suitable working-class dwellings had been erected there. The cost of the Diggle scheme would be £6,755, giving a yearly loss of £6 15s. 2d.; Gatehead, loss of £10 9s. 3d.; Uppermill, loss of £13 18s. 2d., making a total yearly loss of £35 13s. 7d.

Warrington T.C. (August 20th. Mr. Edgar Dudley).—£11,223 for works of private street improvement and £1,777 for the purchase of land for purposes of street improvement.—The deputy town clerk (Mr. A. T. Hallaway) said the period asked for the repayment of the loan for private street works was ten years. They had asked for that at nearly every inquiry for the last four or five years, but had not been successful in obtaining it. If they put down paving that would only last a short period they could understand the principle that the Local Government Board had acted upon in granting only seven years for repayment. But the quality of the paving done by the corporation was such as to last at least fifty years. The pavement in Sankey-street had been down for that period, and was as good to-day as it was when it was constructed—in fact, the system of paving would last 100 years. The borough surveyor (Mr. T. Longdin) said no town in Lancashire had a cheaper method of street paving than Warrington.

APPLICATIONS FOR LOANS.

Barnsley T.C.—£1,000 for the extension of the Old Town School.

Clowne R.D.C.—£10,000 in connection with the water supply scheme.

Desborough U.D.C.—£1,307 for the purchase of land for a recreation ground.

Eastbourne T.C.—£931 for road improvements.

Grange U.D.C.—£200 for the extension of a recreation ground.

Halifax T.C.—£2,000 for additions to public baths.

Kent C.C.—£400 for a school site at Cudham, £150 for alterations to the Hollingbourne School and £475 for alterations to the Sheerness School.

Kingsbridge R.D.C.—£400 for a water supply for Stoke Fleming.

Maesteg U.D.C.—£4,069 for alterations to the town hall.

Manchester T.C.—£2,157 for a school site at Chorlton-cum-Hardy.

Middleton T.C.—£25,000 for sewage disposal works.

Pembroke U.D.C.—£8,600 for a housing scheme.

Penistone U.D.C.—£3,500 for the provision of municipal buildings.

Pontefract T.C.—£5,600 for new public baths.

Ramsgate T.C.—£3,206 for the extension of Victoria parade and gardens.

Sandgate U.D.C.—£5,500 for water supply works.

Slough U.D.C.—£150 for a sewer flushing tank.

LOANS SANCTIONED.

Alsager U.D.C.—£3,470 for a sewerage and sewage disposal scheme, of which the surveyor, Mr. H. V. Lynam, is engineer.

Farnham U.D.C.—£560 for road improvement works.

Felixstowe U.D.C.—£849 for works of sewage disposal, to be repaid within thirty years.

Ince U.D.C.—£5,500 for private street works.

Margate T.C.—£13,218 for a refuse destructor.

Morpeth T.C.—£5,810 for workmen's dwellings.

Ossett T.C.—£200 for surface-water drainage and £4,963 for sewerage works.

Pontefract T.C.—£19,000 for the erection of workmen's dwellings.

Prestwich U.D.C.—£2,018 for private street works.

Radstock U.D.C. — £7,044 for forty workmen's dwellings.

Richmond (Surrey) T.C. £3,250 for extension to public baths (to be repaid in thirty years), and £607 for water main (for thirty years).

Saffron Walden T.C.—£2,025 for a water tower.

Stalybridge T.C.—£1,931 for a higher elementary school.

Stamford T.C.—£850 for the provision of public baths.

Thornaby T.C.—£4,300 for the purchase of land for a depot.

Municipal Engineering (Edited by Sydney G. Turner, Assoc.M.Inst.C.E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though [illegible] than a candidate would be expected to supply. The answers are founded upon examination papers set in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters. It will be seen, therefore, that the book is comprehensive, practical and exhaustive.—*Local Government Journal.*

CORRESPONDENCE.

"*Be dumb in arguing; for fewness makes*
Error a fault and truth discourteise."
— Geo. Herbert, "*The Temple*"

ESSENTIALS OF A GARDEN CITY.

To the Editor of The Surveyor.

Sir,—During the past few days a paragraph has gone the round of the Press, under the heading of "A New Garden City," stating that a new garden city is being started at Dovercourt, and the details given show that on 14 acres of land ninety houses are to be built.

May I again be allowed to point out what a garden city really is? After thirteen years of propaganda by the Garden Cities and Town Planning Association, it might have been supposed that the term "Garden City" was tolerably familiar, and that its real meaning was understood by all thinking people taking any interest in social matters. As the appearance of the above-mentioned paragraph this week, and scores of similar instances during the year, show that there is still a good deal of misunderstanding, might I be allowed to define the essentials of a garden city as distinct from a garden suburb and from ordinary development? They may be stated as follows:—

(1) That before a sod is cut, or a brick is laid, the town must in its broad outlines be properly planned with an eye to the convenience of the community as a whole, the preservation of natural beauties, the securing of the utmost degree of healthfulness, and proper regard to communication with the surrounding district.

(2) That in the town acre the number of houses should be strictly limited, so that every dwelling should have ample light and air, with a suitable garden, and that public recreation ground and open space should be provided generously.

(3) That the town area should for ever be surrounded by a belt of agricultural and park land, so that while in the centre the urban problem is being dealt with, the rural portion, which should be the larger part of the estate, may be available for farms and small holdings, in order that the small holder and market gardener may have a new market direct to hand for the sale of produce.

(4) That the return on capital should be limited to, say, 5 per cent, any profit above that amount being applied to the estate itself for the benefit of the community.

(5) That the town should be not merely residential, but also commercial and industrial, that provision should exist for taking the worker and his work away from the crowded centres into the fresh air of the country district, where not only should the land be cheaply obtainable for the employer, but the worker should have a comfortable cottage at a convenient distance from his labour.

It is therefore essential that the land should be of considerable area, and its development should be in the hands of one controlling body, which, in Mr. Howard's scheme, should have for its ultimate object, not the making of huge profits, but the improvement of the conditions of life for all who live on the area. The estate should be somewhere from 6 to 10 square miles in area, and in order to give effect to the desire for the combination of town and country about two-thirds should be reserved for the rural area.

It will therefore be seen at once how absurd is the designation "Garden City" when applied to 14 acres of land.

A "Garden Suburb" provides that the normal growth of existing cities shall be on healthy lines; and, when such cities are not already too large, such suburbs are most useful and even in the case of overgrown London they may be, though on the other hand they tend to drive the country yet further afield, and do not deal with the root evil—rural depopulation.

"Garden Villages," such as Bournville and Port Sunlight, are garden cities in miniature, but depend upon some neighbouring city for water, light and drainage; they have not the valuable provision of a protective belt, and are usually the centre of one great industry only.

The garden city movement stands for the preventive, not as the palliative.—Yours, &c.,

Ewart G. Culpin,
Secretary,
Garden Cities and Town Planning Association.

3 Gray's Inn-place, W.C.
August 14, 1912.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Arbroath, Failsworth £9,000, Louth, Pontefract £6,200; housing and town planning—Fifeshire, Glasgow; roads and materials—Aberdeen, Dundee, West Suffolk £24,000; sewerage and sewage disposal—Audley £15,000, Durham £3,039, Hampton; water, gas and electricity—Barry £130,000.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Camberley U.D.C.—A draughtsman capable of taking levels and preparing plans is to be appointed in the surveyor's department.

BUILDINGS.

Arbroath T.C.—The provision of public baths is under consideration.

Bacup T.C.—The provision of a public convenience in the centre of the town is under the consideration of the Health Committee.

Bourne R.D.C.—The council have approved the plans for the new isolation hospital proposed to be erected on the South-road, and at which it is also proposed to make some provision for sanatoria treatment. The plans provide for sixteen beds, and a sanatoria shed, with an administrative block, and the estimated cost is £4,850. With regard to the sanatoria sheds, the council have decided that the surveyor, Mr. T. Lake, and the medical officer, shall visit and inspect a similar institution recently erected.

Cornwall C.C.—The new county council offices at Truro, built at a cost of £20,000, were formally opened last week.

Dumbartonshire C.C.—It is proposed to build a small-pox hospital at South Hutcheon.

Dumbarton T.C.—Alterations to the slaughter-house are to be carried out, at an estimated cost of £1,300.

Failsworth U.D.C.—A proposal has been made to erect public baths, at an estimated cost of £9,000.

Kingstown U.D.C.—The tender of Mr. Frank Weafer, at £1,053, has been accepted for the erection of baths and wash-houses.

Littlehampton U.D.C.—The Duke of Norfolk has offered the council a site for a fire station on condition that the building is erected in two years, and the council has agreed to this.

Louth T.C.—A sub-committee of the General Purposes Committee are drawing up alternative schemes for the provision of public baths in the borough.

Machynlleth R.D.C.—The tender of Messrs. Holbrough & Co., of Gloucester, at £485, has been accepted for the construction of a new bridge.

Oldham T.C.—The borough surveyor, Mr. E. C. Foote, has received instructions to prepare plans of a small-pox hospital, and for the extension of the Westhulme and Strinesdale hospitals.

Pontefract T.C.—With respect to the scheme for new public baths, it has been decided to accept the plans and estimates, with the provisional tenders, of Mr. A. Nunweek, of Sheffield, whose plans had been selected by the assessor, Mr. Brearley, of Leeds, as the most suitable among eighteen sets entered for competition ten months ago. The total cost, allowing £238 for contingencies, is estimated at £6,200.

Sunderland T.C.—It has been agreed to build a day training college and reconstruct the Bede Collegiate School so as to provide accommodation for 800 secondary school pupils.

Thingoe R.D.C.—It has been decided to build six cottages at Barrow.

Warrington T.C.—A special committee is to consider a report by the surveyor, Mr. T. Longdin, on his proposed instructions and conditions to architects for competition for a new council chamber, or, in the alternative, for the alteration of the existing council chamber.

West Hartlepool T.C.—The tender of Messrs. Pearson & Son, at £174, has been accepted for extensions to the electricity power station.

Whitley and Monkseaton U.D.C.—The tender of Mr. W. Allison, at £4,725, has been accepted for the buildings at the new cemetery.

Yarmouth T.C.—A tram shelter is to be provided on the west side of Caistor-road.

HOUSING AND TOWN PLANNING.

Bourne U.D.C.—A special committee have recommended that a number of houses should be erected on the portion of the recreation ground abutting on Manning-road, at such a cost as would admit of the houses being let at an inclusive rental of 3s. per week.

Dublin T.C.—Resolutions have been passed declaring the Ormond Market area unfit for habitation, adopting schemes for the improvement of both it and the Beresford-street areas, and requesting the Local Government Board at the proper stage to appoint an arbitrator to determine the site value.

Fifeshire C.C.—Dunfermline District Committee have decided to apply to the Local Government Board for permission to proceed with two town-planning schemes for separate areas within their jurisdiction. Mr. J. E. Wilkes, who is preparing the plan for the extended area of Dunfermline, and was also appointed to plan the territory under the Inverkeithing Town Council's scheme, has been selected to prepare their plans.

Glasgow T.C.—The council last week adopted a proposal by a special committee on the Housing of the Working Classes Acts, to take steps for the clearance of five areas of dwelling-houses and buildings, which are alleged to be overcrowded and congested, in the wards of Blackfriars, Hutchesontown, Cowcaddens, Townhead, and Mile End. In an elaborate report prepared in connection with the scheme it was shown that the areas are similar in character, varying from about 2¼ to 3½ acres in extent, the population on each being about 1,200 to 1,500 persons, occupying for the most part houses of one and two apartments.

Horncastle R.D.C.—A move is to be made with the housing question by communicating with the parish councils to ascertain the needs of the various districts. The sanitary inspector has 300 houses on his "black list," 135 of which ought to be closed.

Houghton U.D.C.—A scheme is being considered for the provision of fifty houses.

Lyme Regis T.C.—An additional eight cottages is to be provided in Lower Early Mead Field.

Merthyr T.C.—The tender of Mr. Richard Lloyd, Cefn, at £9,945, has been accepted for the erection of forty-four municipal dwellings at Thomastown.

Morpeth T.C.—The Local Government Board have expressed approval of the scheme for the appropriation of corporation land, on which to build workmen's houses.

Spalding R.D.C.—In response to a suggestion from the Local Government Board, it has been decided to interview the contractors for the housing schemes with a view to seeing whether it is practicable to reduce the cost of building the houses. With regard to the Donington scheme, it was stated that the total cost for the six houses was £1,100. The estimated expenditure, including rates, &c., would be £65 a year, and at 4s. 3d. per week the six houses would bring in £66. At Moulton the conditions were nearly the same, and the rents would work out at 4s. 6d. per week. It was mentioned that at Moulton there was half an acre of land attached to each house, and, considering this fact, it was thought the place would be worth the rent. The clerk remarked that the point of the whole matter was that after the working men had paid for the entire cost of the houses, they would not be their property, but would belong to the parish.

PARKS AND OPEN SPACES.

Partick T.C.—Two new public bowling greens were opened last week at Meadowside Park. The estimated cost of the greens was £1,500, but a sum of £213 was saved on that estimate.

Southport T.C.—A scheme of the Parks Committee has been adopted for the extension of the South Marine Gardens at a cost of £8,500.

REFUSE COLLECTION AND DISPOSAL.

Clacton U.D.C.—The inspector of nuisances now undertakes the removal of trade refuse in the town at a charge of 1s. per hour in respect of horse, cart and man. In order that the house refuse may be collected more expeditiously and the nuisance caused by the carts in the streets minimised, the council have directed the surveyor, Mr. D. J. Bowe, to obtain prices for the supply of two dust vans, with metal covers, and recommend that the vans should be purchased at the earliest possible date. It has also been decided to reorganise the system of collection, so that during the remainder of the season the carts and vans could be filled and despatched to the tip in a more expeditious manner.

Hackney B.C.—Over 39,024 tons of refuse were removed last year from the houses in the borough to the destructor at Mill Fields, a distance varying from ½ mile to 2 miles at the extreme boundaries of the borough. At the rate of 4s. 8d. per load the total cost was £8,561, which was £157 less than in 1910, when the quantity was greater by 457 tons. The total cost of destruction was £6,010, £139 more than in 1910, and reckoned on the estimated population of the borough it amounts to 1s. 3¼d. per head.

ROADS AND MATERIALS.

Aberdeen T.C.—The burgh surveyor, Mr. W. Dyack, has submitted to a special committee alternative plans of road improvement, the details of which will be duly considered. The first proposes the construction of a thoroughfare by way of Commerce-street and Albion-street to Bannermill-street, at a cost of £40,000. The other scheme suggests the opening of a roadway at East North-street to Constitution-street, widening the latter thoroughfare by about 15 ft., to a total breadth of 55 ft. It was pointed out that if this proposal were adopted it would entail the clearance of the slum properties in the Shuttle-lane area, and would further the city improvements scheme. The estimate of cost is £80,000.

Barnsley T.C.—Longman-road is to be improved, at a cost of £333.

Barry U.D.C.—The surveyor, Mr. J. C. Pardoe, has been instructed to prepare plan and estimate for a Marine-drive.

Camborne U.D.C.—The surveyor, Mr. C. D. Bell, has been instructed to prepare an estimate for making up the road at Highville-street.

Chesterfield T.C.—The estimate of the surveyor, Mr. Vincent Smith, at £797, for road widening and fencing in connection with Eastwood Park, Hasland, has been approved.

Cork T.C.—The city engineer stated at a recent meeting of the Works Committee that, as regarded the brick paving of lanes in the city, he had visited some of them with Mr. Price, the Local Government Board engineer, and in some cases they were impressed with the fact that brick paving on concrete was a rather expensive material to put into lanes. Mr. Price thought it would be a good idea if he (the city engineer) would make some suggestions. Brick paving would cost 8s. per super. yard, and there would be a saving if concrete were substituted at 4s. 6d. per super. yard.

Dundee T.C.—At a meeting of the Works Committee Mr. Peter Girrity stated that, although the extent of roadway receiving the attention of the department had been greatly increased, the sum allowed for the upkeep was the same as that allowed twenty years ago. The actual expenditure for last year was £11,871, and the estimate for the ensuing year was £15,920. He considered that this additional £4,000 was very much required, and drew attention to the dangerous condition of the streets, at the same time expressing surprise that there were not a lot of claims for accidents caused by the holes in the roads. It would take £60,000 to make the streets of Dundee right. The estimates were approved.

East Suffolk C.C.—A scheme is being considered for the construction of a new road from near White House Farm, near Carlton Colville, to Burgh St. Peter Staithe, so far as the work is situate in the county of East Suffolk. The proposal is to construct a new road, about 1½ miles in length, with an available carriageway 18 ft. width, with a flint surface, at an estimated cost (to East Suffolk) of £3,500.

Galway C.C.—The council, at their last meeting, adopted a direct labour scheme for road maintenance.

Hackney B.C.—The whole of the property has now been acquired for the widening of the narrow neck in Mare-street, near the Triangle, and the London County Council propose to proceed with the doubling of the tramway at an early date. The cost of the work, including 60 yds. new rails and alterations to mains, is estimated at £1,200.

Hythe T.C.—Barrack-hill is to be improved, at a cost of £650.

Kingstown U.D.C.—The tender of Messrs. Hull & Co., of Ringsend, at £1,049, has been accepted for the construction of a new road from Lower George's-street to Northcote-avenue.

Lancashire C.C.—The Local Government Board have refused the application of the council for powers to borrow £3,000 for strengthening and sheeting Ewood Bridge-road at Haslingden, a portion of the main road between Accrington and Manchester, the upkeep of which has become expensive because of the heavy motor and other traffic. The board hold that the proposed work is a repair, and should be paid for out of revenue. The inspector of the Local Government Board who held the inquiry advised that the road should be paved, and said a macadam surface could not bear the heavy strain now put on some Lancashire roads. The Local Government Board would sanction a loan for paving. The county council had agreed to bear 90 per cent of the cost of strengthening and sheeting, and it lies with them to decide what shall be done.

Louth R.D.C.—An improvement is to be effected at Elkington Hill, a very steep gradient, at a cost of £375.

Maidenhead T.C.—The plans of the surveyor, Mr. P. Johns, for the widening of St. Mark's-road have been approved, and application has been made for a loan for carrying out the work.

Surbiton U.D.C.—The tender of Messrs. W. H. Wheeler & Co., Limited, at £1,357, has been accepted for making up Malvern-road.

West Suffolk C.C.—A road improvement scheme at Bury St. Edmunds, estimated to cost £24,000, has been approved.

SEWERAGE AND SEWAGE DISPOSAL.

Audley U.D.C.—A scheme of sewage disposal, estimated to cost £15,000, is under consideration.

Droylsden U.D.C.—The tender of Messrs. Mather & Platt, Limited, at £315, has been accepted for the supply of sludge plant.

Durham R.D.C.—The surveyor, Mr. G. Gregson, has submitted a revised estimate (£3,039) for sewerage and sewage disposal works for East Hetton.

Hampton U.D.C.—The surveyor, Mr. S. H. Chambers, and the sewage disposal works manager, have been asked to prepare a scheme jointly in connection with the proposed extension at the sewage disposal works, such scheme to embrace the best points of the three schemes submitted to the council, so as to provide for a present and future population of 12,000.

Linthwaite U.D.C.—A special meeting is to be called to consider a letter from the West Riding Rivers Board stating that now progress was being made with the construction of the Linthwaite and Golcar joint sewage disposal works at Johnny Moor Hill, the board felt that the time had come for asking the manufacturers and the council to come to some definite agreement as to what trade refuse would be received into the sewers and dealt with by the local authority, and what would have to be purified by the manufacturers themselves.

Mansfield-Woodhouse U.D.C.—The plans of the surveyor, Mr. F. P. Cook, for the sewering of Welbeck-street, at a cost of £140, have been approved.

Thirsk R.D.C.—A sewage disposal scheme is to be prepared for Pickhill.

WATER, GAS, AND ELECTRICITY.

Alsager U.D.C.—The surveyor, Mr. H. V. Lynam, reported at the last meeting that the New England Boring Company had now bored to a depth of 262 ft. at the Oak Farm boring, and that there was a continuation in the strata of red sandstone. The council decided, upon the advice of their engineer, Mr. G. B. H. Soame, to proceed to 600 ft. deep if necessary.

Barry U.D.C.—Steps are to be taken to promote a Bill for a water supply scheme, estimated to cost £130,000.

Dundee T.C.—Extensions estimated to cost £49,000 are proposed at the electricity works.

Greenock T.C.—A surplus of £5,255 is shown in the accounts of the electricity undertaking for the past year.

Hammersmith B.C.—The growth of the electricity undertaking is a satisfactory feature of the year, although the rate of increase is substantially less than during the previous year. There was a nett surplus from the undertaking of £8,307.

Loftus (Yorks) U.D.C.—It has been decided to provide a tank with a capacity of 6,000 gallons to store water for improving the supply at East Loftus.

Louth T.C.—The Lighting Committee have under consideration, and will shortly present for the approval of the council, a scheme for the automatic lighting and extinguishing of lamps.

Penzance T.C.—The tender of the gas company for public lighting has been accepted at 2s. 10d. per 1,000 cub. ft., repairs at £105 per annum, and hire of meters at 4s. per annum.

Spalding R.D.C.—The council have purchased a portion of the South Lincolnshire Water Company's undertaking, and it has been decided to appoint an engineer to advise in connection with the carrying out of the scheme.

Tavistock R.D.C.—The tender of Mr. G. Doney, of Horrabridge, at £1,658, has been accepted for the construction of waterworks.

Welshpool T.C.—The corporation have been advised by the Local Government Board to engage the services of an experienced water engineer with the object of improving the waterworks.

Widnes T.C.—The provision of a new water tower, at an estimated cost of £8,500, is being considered.

Wigton R.D.C.—The surveyor, Mr. T. B. Simmons, has been instructed to prepare an estimate of the cost of a 4½-in. main for the supply of water to Hatcliffe.

MISCELLANEOUS.

Market Bosworth R.D.C.—The Finance Committee called attention to an item of £70 for disinfectants per annum, and Mr. Pegg said there ought to be a contract. The sanitary inspector said the majority of the disinfectants were used in scavenging, and there was no waste. The council decided to contract for disinfectants in future, the sanitary inspector stating that no tender had been invited for six years.

Surbiton U.D.C.—Mr. H. T. Mather, the surveyor, has been asked to have plaster casts made of some of the tramway points and lines where the groove is of a dangerous width, or otherwise defective, and the highway Committee have been authorised, if they consider it advisable, to engage a tramway engineer of experience, at a fee not exceeding £10 10s., to assist them in formulating a statement of their requirements for presentation to the London United Tramways Company.

Municipal Profits at Portsmouth.—With one exception only, the municipal undertakings at Portsmouth were last year a marked financial success. The nett profits were: Tramways, £24,035; docks, £2,585; electric light, £3,491; telephones, £601. After all capital charges had been paid upon a pier costing £70,000, there was a nett loss upon its working of £4,000, but this year the loss will be only £2,000.

Bricks from Clinker.—The borough surveyor of Bermondsey, Mr. R. J. Angel, has reported on a suggestion that the clinker from the refuse destructor could be largely used for making concrete and grout for paving roads and for making bricks. He has made various experiments which tend to show that it is impracticable to make bricks from the clinker, as the cost is too high as compared with the price of Fletton bricks.

Town Planning Schemes.—The Local Government Board have given authority for the preparation of four further town planning schemes under the Housing, Town Planning, &c., Act, 1909, for Bournemouth, Halifax and Southport. In the case of Southport, the scheme is to extend to an area of about 2,848 acres. In the case of Halifax, two schemes are to be prepared for the Ovenden and Warley districts of the borough, and they comprise about 880 acres and 756 acres respectively.

PERSONAL.

Mr. A. M. Ker, deputy borough surveyor of Warrington, has had his salary raised by £50 a year.

Mr. F. W. Greig, surveyor to the Chertsey Urban District Council, who has been indisposed, is making progress towards recovery.

Mr. R. S. Macmillan, of the burgh surveyor's office, Leith, has been appointed chief assistant to the burgh engineer, surveyor, and master of works of Clydebank, out of eighty applicants.

Mr. A. B. McDonald, city engineer of Glasgow, is to retire in November, but will continue to give his services to the corporation in a consultative capacity. His retiring allowance will be two-thirds of his salary (£1,000).

Mr. W. H. Eley, surveyor to the Haverhill Urban District Council, has been appointed surveyor, sanitary inspector, and inspector of explosives to the Newmarket Urban District Council, at a salary of £210 per annum. There were 114 applicants.

Mr. A. J. Hardwick has been appointed architect for two semi-detached cottages and one detached cottage at the sewage disposal works of the Surbiton Urban District Council, the cost of the buildings not to exceed £900; and Mr. E. R. Babbs has been instructed to prepare the quantities.

Mr. H. T. Mather, surveyor to the Surbiton Urban District Council, has been appointed, with the clerk and three members of the council, to represent that body at a conference to be held with the Surrey County Council's surveyor (Mr. A. Dryland) and the chairman of the County Highways and Bridges Committee as to the plans of the proposed new loop road, which will affect Surbiton, Esher and the Dittons, and the Maldens and Coombe. The two last-named districts will also be represented.

Mr. P. J. Lynam, county surveyor of Louth, died recently, we regret to state, after a long and painful illness. Mr. Lynam, who had passed his sixtieth year, was educated at Queen's College, Galway, and in due course joined the Indian Civil Service, in the discharge of the duties of which he spent some years in Ceylon. Returning to Ireland some thirty years ago, he was appointed county surveyor of Mayo, and subsequently county surveyor of Louth under the Grand Jury, since superseded. Among the important works which he carried out was the building of the new courthouse at Drogheda. Latterly he did everything in his power to improve the county roads by means of steam rolling, which is not yet general in Ireland.

Mr. J. W. B. Blackman, the city engineer of New Westminster, British Columbia, was born in Kent, in 1878, and was educated at Highbury House College, St. Leonards-on-Sea. His early professional training was received at the hands of Mr. G. F. Miller, M.I.MECH.E.; and later he studied at the Brighton College of Engineering and Science, where subsequently he held a mastership. For six years he practised at Brighton, and frequently contributed to the technical journals. In 1907 he accepted an appointment in Vancouver, and remained there until 1909, when he was elected to his present appointment. He is a Professional Associate of the Surveyors' Institution, a member of the Society of Architects, and an associate member of the Canadian Society of Civil Engineers.

Sand Drifts on Roads.—Certain roads in the eastern portion of the Pontefract Rural Council's district have from time immemorial given trouble to the authorities by becoming "choked" by sand blown from adjoining lands. Hitherto the council have removed the sand in carts lent by the farmers, who have now objected to share what they contend is a public liability. At a recent meeting of the council the surveyor (Mr. J. P. Senior) stated that for 135 yds. the road in Eggborough township was covered with fine sand to an average depth of 18 in., while in the hedgerows it was 5 or 6 ft. deep. He calculated that in that distance there was at least 800 tons of fine red sand. It was decided that if the farmers persisted in their refusal to provide team labour the council's men should level the sand uniformly over the highway and leave the users of the road to work out their own salvation.

TORQUAY'S NEW PAVILION.

COMPLETION AND OPENING.

The public opening of the new pavilion which has been erected by the Corporation of Torquay in the Princess Gardens took place on Saturday last, and the crowd that filled the structure were delighted with everything they saw.

The architect, Mr. H. A. Garrett, the borough engineer, was publicly congratulated upon the success of his efforts, and, in reply, he said that a pavilion for Torquay had been near and dear to him for the past eighteen or twenty years, as he considered it putting the finishing touch to their beautiful sea-front.

The total area of the ground covered by the pavilion is 19,377 super. ft., and the building comprises a main, or central, hall 140 ft. long by 60 ft. wide, and is considered to be the finest in the West of England at least. In the central part it is 98 ft. wide. The grand tier, or balcony, is constructed on the three sides of the central portion of the building, approached by a double flight of ornamental cast-iron stairs. The building is entered through a vestibule from the Vaughan-road, on each side of which there is a box-office, and thence into a crush-room 27 ft. long by 16 ft. in width. The approach to the main hall is again through three sets of double bevel-edged glass swing doors.

The general café and tea rooms are at the sea end of the hall, a splendid view of the water being obtainable. The recess taken by the stage is 36 ft. wide by 20 ft. deep, with retiring-rooms on either side. Outside the building, facing the Princess Gardens, for an average width of about 16 ft., and also facing the harbour, there is an open asphalt promenade, this being reached from the interior of the building at the balcony level by two flights of steps. The four corners of the pavilion are surmounted by an octagonal open frame shelter constructed on the principle of a bandstand, and can be used as such when required.

The roof of the building is solid—double-lined on the outside of the steel framework flooring, overlaid with roofing felt, and externally covered with zinc, the interior being of decorated fibrous plaster work. This method, it is claimed, will make the building cool in summer and warm in winter. The central portion of the building is surmounted by a dome 45 ft. high, at the apex of which is a copper figure of Britannia, given by the mayor. There are two smaller domes on each side of the main entrance, these having copper figures of Mercury at the summit.

The interior walls are in beautiful designs and panels of ornamental fibrous plaster work, with a dado of Australian oak panelling. The walls are 14-in. brickwork, the whole of the interior being faced with imitation marble. The floor is a double one, the finished surface being of maple. The building proper has cost £17,000, the work having been well carried out by Mr. R. E. Narracott, contractor, of Torquay.

The gardens in which the new pavilion stands originally formed part of the foreshore. They are formed of some 20 ft. depth of sand filling, dredged up from the new harbour area and filled in behind the new sea-wall, the consequence being that the erection of a pavilion on such a site necessitated a foundation of special design. Upon examination the sand filling was found to be well consolidated, and the borough engineer accordingly recommended the construction of a Portland cement reinforced-concrete foundation "raft" covering the whole area of the site. The principle upon which this raft has been constructed was fully described in our issue of March 31, 1911 (p. 465).

FOR OTHER ADVERTISEMENTS
See End of Paper.

BOROUGH OF BATLEY.

BOROUGH ENGINEER AND SURVEYOR'S DEPARTMENT.

APPOINTMENT OF JUNIOR ASSISTANT.

Wanted, in the Borough Engineer's Office, a Junior Assistant. Salary £80 per annum.

Applications, in candidate's own writing, accompanied with not more than three copies of testimonials, to be sent to Mr. J. H. Craik, Town Clerk, Batley, not later than Tuesday, the 10th of September, 1912, endorsed "Assistant."

OSCAR J. KIRBY,
Borough Engineer.

August 21, 1912.

HAVERHILL URBAN DISTRICT COUNCIL.

APPOINTMENT OF SURVEYOR, INSPECTOR OF NUISANCES AND EXPLOSIVES INSPECTOR.

The above Council will, at their meeting to be held on the 16th September, 1912, proceed to the appointment of a Surveyor, Inspector of Nuisances and Explosives Inspector for their district.

The combined salary will be £131 1s. per annum divided as follows:—

Salary as Surveyor	£40	0	0
Salary as Inspector of Nuisances	90	0	0
Salary as Explosives Inspector ...	1	1	0
	£131	1	0

The appointment as Inspector of Nuisances will be subject to the approval of the Local Government Board.

Candidates must have a thorough knowledge of the duties of the offices, and be competent to keep the books and accounts applicable thereto.

The person appointed will be required to devote the whole of his time to his duties, and to give security in the sum of £200.

The appointment will be subject to one calendar month's notice on either side.

Applications, in candidate's handwriting, stating age, present and previous occupation, and accompanied by copies of not more than three testimonials of recent date, endorsed "Application for Surveyor," must be addressed and sent to me not later than 10 a.m. on the 9th day of September, 1912.

(By order)
THOMAS BATES,
Clerk to the Council.

Haverhill, Suffolk.
August 21, 1912.

CARSHALTON URBAN DISTRICT COUNCIL.

GRANITE AND STEAM ROLLING.

Tenders are invited as follows:—

1. For the Supply of 300 cubic yards of 2-inch and 1,100 cubic yards of 1½-inch Granite, either Cleehill, Quenast, Penmaenmawr or Guernsey (no others will be considered), delivered at Mitcham, Hackbridge, Sutton and Wallington Stations, as required, before 31st March, 1913.
2. For the Hire of a Steam Road-Roller, fitted with an approved patent attachment for Watering the Wheels and the Road, of not less weight than 10 tons, for a period of about 90 days, as may be required, during the year ending 29th October, 1913.

Particulars in each case may be obtained on application to the Council's Surveyor, Mr. W. Willis Gale, A.M.I.C.E., at this office.

Sealed Tenders, addressed to the Chairman, and endorsed "Tender for ——," should be delivered at this office not later than 12 noon on Wednesday, 11th September, 1912.

The Council do not bind themselves to accept the lowest or any Tender, and the persons whose Tenders are accepted, will be required to enter into the usual contract and bond, which may be seen at this office.

(By order)
C. P. LOVELOCK,
Clerk.

District Council Offices,
The Square, Carshalton.
August 21, 1912.

LEATHERHEAD URBAN DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

Applications are invited for the post of junior assistant in the Surveyor's office. Salary 12s. per week.

Applications, in candidate's own handwriting, stating age and experience, together with copies of three testimonials, to be delivered to the undersigned by the 31st inst., endorsed "Assistant."

Preference will be given to one who has been used to drawing, and who has had experience in a Surveyor's office.

SIDNEY R. DRAKE,
Surveyor.

Council Offices,
Leatherhead.
August 21, 1912.

INSECTS AND DISEASE.

THE MECHANICAL AND BIOLOGICAL METHODS OF TRANSMISSION.

[Extracts from an article contributed to *Scientific American* by W. C. Rucker, M.S., M.D., assistant surgeon-general, United States Public Health and Marine Hospital Service.]

The idea of the transmission of disease-producing organisms to man by insects is no new thing. It is only within recent years, however, that scientific workers have been able by the use of the microscope and other instruments of precision to trace the course of the seeds of disease through the body of the insect and into the body of man.

In order intelligently to approach the consideration of this latter-day scientific development it is necessary to understand the way in which the insect acquires the organisms which produce disease, the changes which these organisms undergo within the body of the insect, the way in which they are introduced into the human body, and the developmental changes which take place in them in the course of their attack upon the human victim.

Broadly speaking, there are two general methods by which this process is accomplished. These are the mechanical and biological methods. In the mechanical transmission of disease germs by insects we find the insect in question coming accidentally in contact with disease-producing organisms and carrying them into the body of man either directly by biting or indirectly as by infecting food. It is not necessary for the life of the germ in question that it be carried by any particular insect. No developmental changes which are of any account occur in the organisms during the period of this transportation to man, and therefore we may find many different insects of totally different habits acting as vectors for a given germ. As an example of the mechanical method of transmission, in contradistinction to the biological method of transmission, we have the carriage of typhoid bacilli from infected excrement by flies. In this instance the fly smears his feet, proboscis and wings with the discharges of a person who has typhoid fever, and then, alighting on foodstuffs, there deposits the germs to be taken by some unsuspecting person. In this instance no change whatever has been undergone by the bacilli, and they could quite as well have been carried by a cockroach which might similarly infect food. In the case of the transmission of tuberculosis by flies, the mechanical method of transmission still obtains, but it has been determined by experiments that, in this instance, there may be an actual multiplication of the tubercle bacilli within the body of the fly, and that living bacilli may be discharged in the fly's excreta. In the case of the transmission of plague by the flea, another example of mechanical transmission, it is not necessary that any particular species of flea act as the vehicle. The flea becomes infected by biting an animal which has the germs of plague in its blood. The flea imbibes this pest-laden material and subsequently bites a human being. It is not by the act of biting, however, that it transmits the germs of this disease. The flea has the habit of depositing his excrement at the time of biting. A person who is bitten naturally suffers some irritation and rubs or scratches the bitten place. In doing this the germs of the disease are rubbed into the skin, which they penetrate and thus gain entrance to the body. . . .

Flies may carry the germs of typhoid fever, cholera, dysentery and tuberculosis, and it may be that these ubiquitous household pests may carry other diseases as well. Two varieties are commonly met with in this country, the *Musca domestica*, or common house fly, and the stable fly, or *Stomoxys calcitrans*. Both are bred in manure, and it has been recently estimated that each pair of flies surviving the winter may be the ancestors of 8,000,000 living flies during the summer. Flies are omnivorous in their habits, and will eat filth of almost any kind. The first thing to do to get rid of flies is to exclude them from the home of man, and this may be accomplished by the use of screens, both as to doors and windows. These should fit accurately, and should be constructed of some permanent non-corrosive material, such as bronze wire. Inasmuch as screens are also intended to exclude mosquitoes, the screening should have a mesh of at least 18 to the inch. After this has been done, it remains to destroy the breeding places of the flies and get rid of those things which attract them. Stables or other out-buildings should be well screened. The manure should be stored in watertight metal-lined boxes which are emptied at least once in ten days. The frequent addition of chlorinated lime, or soaking with kerosene oil will also prevent breeding. Stables should be maintained in a cleanly condition. The unsanitary garbage can is the fly's paradise. The watertight metal garbage can with a tight-fitting lid will feed no flies. If the remainder of the premises is kept clean few of these pests will be seen therein. . . .

Reference has already been made to the *rôle* of the flea in the transmission of plague. This is of extreme importance, because plague is primarily a disease of rodents, and secondarily and accidentally a disease of man. Almost every fur-bearing animal has fleas which may be easily infected by the ingestion of infected blood. Thus it is found that the rat flea, the ground squirrel flea, and the tarbagan flea have all been convicted at one time or another of having transmitted bubonic plague. The remedy is obvious. If the animal carrying the flea which bridges the space between the infected rodent and the healthy human being be excluded from the home of man there need be little fear of bubonic plague. Therefore the work which was carried on in California for the eradication of plague was directed very largely at the extermination of rodents. This may be accomplished by a simultaneous attack upon the home and the food supply of the rat and by killing them by the use of poisons and traps. Plague is out upon its march around the world, and for the past five years has been making a steady advance up the Spanish main. Very recently it has appeared in Porto Rico, and for all we know it may now be smouldering in the rodent population of some of our large Atlantic seaports. If a survey of these rodents is made now and the foci of infection stamped out much money and many lives may be saved in the future. This is a measure of immediate necessity if we would protect our sanitary and commercial interests.

Stone-breaking Machinery.—The call for the patent Acme stone-breaker is an ever-increasing one, and among other numerous and recent buyers, the following councils have placed their order with Messrs. Goodwin, Barsby & Co., Limited, St. Margaret's Ironworks, Leicester, during the past few months—*viz.*: Donegal County Council (two machines), Blaenau Festiniog Urban District Council, Kerry County Council, Queen's County Council, and Tredegar Urban District Council. All these orders are for the firm's patent Acme special portable stone-breaker, with patent portable and lifting screen. Still further, Wigtownshire County Council and Monaghan County Council have given orders for the patent Acme portable automatic stone-breaker, both of these being repeat orders. It may be mentioned that in order to cope with their increasing business, Messrs. Goodwin, Barsby & Co. are now being compelled to make further additions to their works, the additions they are now making in two places being the fourth and fifth they have been obliged to arrange during the past few years.

Problems in Engineering.*—This reprint from the popular students' section of our contemporary consists chiefly of questions that have been set at the examinations of the Institution of Civil Engineers and of the Institution of Municipal and County Engineers. There is no index to the work, but the matter is classified under the heads of Mechanics and Hydrostatics, Strength and Elasticity of Materials, Theory of Structures, Surveying and Levelling, Water Supply and Hydraulics, Sewerage, Sewage Disposal, Road Making and Tramways, Building Construction and Materials, Law, and Miscellaneous. This book is calculated to be of considerable use to students in these subjects, but it would have been an advantage if the source of the questions could have been stated. The answers have in general been given rather more fully than would be the case at an examination, with the object of explaining the principles to a student without his having to refer to a text-book for them. The price brings the work within the reach of all students, and there is so much useful matter compressed into a small space that even the best-prepared candidate cannot afford to be without it.—*Sanitary Record.*

* "Problems in Engineering, with Solutions." Being Questions and Answers reprinted from the Associateds' and Students' Section of The Surveyor and Municipal and County Engineer. First Series, 1900-10. Edited by Sydney G. Turner, Assoc.M.Inst.C.E. Price 5s. nett. London: St. Bride's Press, Limited, 21 Bride-lane, E.C.

Municipal Work in Aylesbury.*

By W. H. TAYLOR, Engineer and Surveyor to the Urban District Council.

Aylesbury is situated in the centre of Buckinghamshire, about 40 miles from London, on the London and Banbury road. It is the county town of Bucks, and gives its name to the large and fruitful Vale of Aylesbury, long celebrated for verdure and fertility. The town was incorporated and made a Parliamentary borough by a charter from Queen Mary in 1553-54, but having by neglect lost its charter it is now under the control of an urban district council of eighteen members.

STATISTICS.

Area of urban district, 3,300 acres; population, 1901, 9,244; 1911, 11,048; rateable, £53,979; number of inhabited houses, 2,740; birth-rate, 20·01; penny rate produces £203 to the General District Fund; levels above ordnance datum, 240 ft. to 304 ft.

HIGHWAYS.

There are 8 miles of main roads and 6½ miles of other roads, and the county council pay the urban council the sum of £1,403 per annum for the former. In respect to several of the principal other roads the county council pay the urban council one half the cost of materials per annum. The surface of the roads over the railways and the approaches are repaired by the railway companies. Except several roads in the centre of the town, which are paved with setts, the main roads are all surfaced with granite, and below is a detailed cost of repairing High-street last year:—

	£	s.	d.
135 tons of 2-in. granite, at 10s. 8d.	66	13	4
31 tons fine gravel, at 4s. 3d.	6	11	9
3,700 gallons water, at 1s.	0	3	8
Labour, spreading granite, gravel, and sweeping for roller	4	9	7
Carting granite, gravel and water, for rolling	7	1	8
Steam rolling	6	11	8
	£91	11	8

Area coated 2,044 super. yds. = 10·75d. per super. yard.

With the exception of three or four, the other roads and side streets are surfaced with flints, and the following is the cost of repairing one last year:—

	£	s.	d.
97½ cube yards flints, at 6s. 10d.	33	6	3
15½ tons fine gravel, at 4s. 3d. ...	3	5	11
2,600 gallons water, at 1s. ...	0	2	7
Labour, spreading flints, gravel, and sweeping for roller	2	18	0
Carting flints, gravel, and water	4	15	0
Steam rolling	3	15	0
	£48	2	9

Area coated 1,260 super. yds. = 9·17d. per super. yard.

Tarmac, &c.—In 1908 two short lengths of roads were laid down, one with Tarmac and the other with Tarvia binder. Both these roads are subject to heavy traffic, and for three years stood without any repairs being necessary. The cost was as follows:

TARMAC.

	£	s.	d.
92¼ tons Tarmac, at 14s. 11d. ...	68	19	10
Labour, spreading, &c.	3	2	4
Carting	4	17	4
Steam rolling	4	14	6
	£81	14	0

Area coated 1,050 super. yds. = 18¼d. per super. yard.

TARVIA BINDER AND GRANITE.

	£	s.	d.
36¾ tons binder	41	13	9
17½ barrels Tarvia	11	3	7
53 tons 1 cwt. 2-in. granite	28	16	5
9 tons granite chippings	5	17	0
Labour spreading, &c.	7	17	11
Carting	6	13	11
Steam Rolling	3	10	6
Sundry materials	0	6	5
	£105	19	6

Area coated 1,355 super. yds. = 18¾d. per super. yard.

The section of road laid down with the Tarvia binder included a top-dressing of Tarvia and granite chippings, and it being a little further from the station than the Tarmac section, the carting was a little more costly.

Tar-painting.—In 1909 and 1910 only the main roads in the inhabited area were treated, but last year the whole of the main roads and several other roads were done, and it is proposed this year to do the same. The tar is carted from the local gasworks in slop carts and applied to the road by means of a small spreader attached to a 50-gallon copper. The tar, after being applied to the road, is well brushed in by hand and clean Leighton sand sprinkled on the surface. Last year the cost was as follows:—

	£	s.	d.
20,231 gallons tar, at 1½d.	126	8	9
256 tons 9½ cwts. sand	43	15	1
7⅞ tons granite chippings	4	19	6
Brushes, fuel, &c.	9	9	5
Labour	91	13	3
Carting	21	18	6
Depreciation of tar boilers, &c.	5	15	6
	£304	0	0

Area treated 97·524 super. yds. = 0·748d. per super yard.
Length 8·72 miles = £34 17s. 2d. per mile.

The author has found treating the roads with tar not only prevents the dust nuisance to a considerable extent, but also prolongs the life of the road very considerably.

Private Street Works.—The Private Street Works Act, 1892, has been adopted, and several streets have been made up under this Act during the last two years. The cost of these streets was 9s. 7d. per lineal foot, including soil sewers, manholes, gullies, 6 in. of hard-core and 6 in. of flints on carriageways, sett channelling on lime concrete, 5-in. by 10-in. stone kerb on lime concrete, and 3-in. tar-paved footways on 6-in. brick rubble. The average cost of these works was as follows:—

	£	s.	d.
Soil sewers, 9 in. diameter, 6 ft. deep, per lineal foot	0	1	11
Gully pans, iron frame and grating, including connection to sewer, each	3	18	0
Manholes in 9-in. brickwork, 5 ft. by 2 ft. 6 in., and 6 ft. 6 in. deep, with covers complete, each	9	17	0
5-in. by 10-in. stone kerb, on 4 in. lime concrete, per lineal yard	0	4	0
4 in. by 4-in. stone sett channel on 4 in. lime concrete, per super. yard	0	8	6
4-in. by 4-in. stone sett crossings on 6 in. lime concrete, per super. yard	0	9	1
6 in. thick stone hardcore hand packed, per super. yard	0	1	0
6 in. thick flints, including rolling, per super. yard	0	1	8
3 in. thick tar-paving	0	2	3

Concrete Kerb and Channel.—The author has experimented making concrete kerb and channel blocks in wood moulds. They turned out very satisfactorily, and one length has been laid. The kerb and channel blocks were made with Portland cement and ¼-in. to dust Clee Hill granite chippings 1 to 3. The kerbs are 5 in. by 10 in., 3 ft. long, and the blocks 9in. wide slightly dished, 15 in. long and 4 in. thick, and cost to make 5d. and 3d. per foot respectively. When laid complete on 4 in. of cement concrete and the blocks protected by one row of 4-in. by 4-in. setts, the cost worked out as follows:—

	s.	d.
5-in. by 10-in. concrete kerb on 4 in. cement concrete, per lineal foot ...	0	10½
9-in. by 4-in. concrete channel block, on 4 in. cement concrete, including one row of 4-in. by 4-in. setts, per super. yard	8	9

Highway Yard and Depot.—The town's yard is in Cambridge-street, in a very central position and comprises stabling for eight horses, steam roller, cart and material shed, flint stores, workshop and messroom for workmen. The land, 1 acre, together with two small cottages, cost £700, and the buildings, &c., £1,893; total £2,593. Six horses are owned by the council at the present time, and team labour can be hired for 6s. 6d. per day for horse and driver. The

* Paper read at the recent annual meeting of the Institution of Municipal and County Engineers.

cost of keeping the council's horses last year was as follows:—

	£	s.	d.
Fodder	190	14	2
Shoeing	12	19	11
Repairs to carts, harness, &c.	71	13	2
Rent of field	21	12	0
Rent of stables (say)	40	0	0
	£336	19	3

Average number of horses 5·67.
Cost per horse per week = £1 2s. 10d.

Street Lighting.—The street lighting is carried out by the council, and the cost last year worked out as follows:—

	Flat flame burner.			No. 4 Kern burner.			Large incan. burner.		
	£	s.	d.	£	s.	d.	£	s.	d.
Gas	1	13	4	1	15	0	4	0	0
Mantles		—		0	1	4½	0	3	1
Globes		—		0	0	6	0	3	7
Sundries ...	0	1	0	0	1	8½	0	1	8½
Lighting and extinguishing ...	0	8	9	0	8	9	0	8	9
Labour for repairs	0	3	0	0	4	0	0	4	0
Cost per lantern per annum	£2	6	1	£2	11	4	£5	1	1½
Number of mantles used per lantern per ann.							7		7
Number of globes " " " "							3·1		3·2
Cost of gas 3s. 4d. per 1,000 cub. ft.									
Number of hours lanterns burning per annum							1,792		

The lanterns on the outskirts of the town are fitted with Gunning's automatic lighting and extinguishing apparatus, and give every satisfaction. The lanterns have been gradually converted from flat flame burners to incandescent burners, out of current rate.

PUBLIC BATHS.

The public baths are situated in Bourbon-street, and were presented to the town in 1895 by the late Baron Rothschild, of Waddesdon Manor. They are open only during the summer months, and consist of a swimming bath, 60 ft. by 20 ft., and nine private slipper baths. The price of admission to the swimming bath varies from 3d. to 1d., according to the day, and the slipper baths 3d. first-class and 2d. second-class. Last year the swimming bath was used by 11,375 persons, and the slipper baths by 4,334 persons; total, 15,709; and the loss on the year's working was £136.

SEWAGE DISPOSAL WORKS.

The sewage disposal works are situated about 1¼ miles north of the town, consisting of a screening chamber, five open settling tanks, twelve contact beds, two storm-water filter-beds, 12 acres of land, and pumping and sludge pressing plant.

Flow.—The lowest flow during the hot summer of 1911 was 226,000 gallons in twenty-four hours.

Tanks.—The five tanks have a total capacity of 305,000 gallons, three 35,000 gallons each, and two 100,000 gallons each. Two small tanks and one large one are used during the day, one small tank being kept for the night flow and the remaining large tank is kept empty in case of a storm.

Contact Beds.—During fine weather the beds are used on the double contact system, and each have a working capacity of about 25,000 gallons. The media averages 3 ft. deep, and consists of 1 ft. of fairly large clinker, and 2 ft. of coke breeze and clinker, 1 to 1½-in. gauge.

Storm-water Filters.—The two storm-water filter-beds were constructed for contact beds, but they are used as continuous filters, and hold 50 000 gallons each. The media is burnt ballast, average 3 ft. 6 in. deep.

Land.—The bed effluent is pumped on the land, which is divided into six sections, and fed by a channel running the whole length of the field. The land is not underdrained, and the subsoil is clay.

Pumping Plant.—The bed effluent and storm water gravitates to the pump-house, and is pumped on to the land and storm beds by means of centrifugal pumps driven by gas engines.

Sludge Pressing.—The sludge gravitates from the settling tanks into a well in the pump-house, and is then lifted by means of a 5-in. Tangyes' sludge into a large tank on the top of the building. Ground greystone lime is then added, and the sludge pressed by two Manlove, Alliott & Co.'s sludge presses. The cake is carted away from the works by farmers, but during the summer it is difficult to dispose of.

Bed Washing.—The contact beds are washed every three to four years. The washing is done by means of a portable engine, and one of Messrs. Hughes & Lancaster's revolving washers. The cost of emptying, washing, and refilling, including new clinker, and a certain amount of new coke breeze, works out at 4s. per cube yard.

Effluent.—The result of the last analysis made by the county analyst, Mr. W. W. Fisher, is as follows:—

EXPRESSED IN GRAINS PER GALLON.

Total solid matter in suspension	Negligible.
Total dissolved solid matter	49·0
Chlorine as chlorides	6·0
Ammonia free and saline...	0·756
Albuminoid ammonia	0·053
Nitrogen as nitrates and nitrates ...	0·21
Oxygen absorbed by organic matter in 3 hours	·497

LEEDS SEWAGE DISPOSAL.

THE KNOSTROP WORKS.

[A few interesting and useful data extracted from the annual report of the sewerage engineer for the year ended March 31st last.]

Total volume of sewage treated in tanks from April 1, 1911, to March 31, 1912, 6,326,137,000 gallons.

Average daily volume, 17,331.882 gallons.

Average per head of population per day, 40½ gallons.

About 20 per cent of the total average dry-weather flow was derived from trade sources.

Steam power plant for pumping and other purposes evaporated 6·9 lb. of water per lb. of coal consumed; price of coal 10s. per ton.

Cost of pumping was 4s. 1d. per 1,000,000 gallons lifted 12 ft. high, or 4·083d. per 1,000,000 gallons per foot of lift.

Amount of garbage removed from the sewage by the screens was 4·3 cwt. per 1,000,000 gallons of sewage treated.

Cost of screening sewage was 1s. per 1,000,000 gallons treated.

Amount of grit or detritus deposited in pits at entrance to tanks was 3·4 cwt. per 1,000,000 gallons treated.

Total cost of tank cleaning process was 3s. 3d. per 1,000,000 gallons of sewage treated.

Total cost of chemical precipitation was 3s. 5d. per 1,000,000 gallons of sewage.

Volume of liquid sludge deposited in tanks (the average water content being 91·85 per cent), was 4,343 gallons per 1,000,000 gallons of sewage. After pressing just under 6 tons of sludge cake was produced per 1,000,000 gallons of sewage. The total cost of sludge pressing was 10s. 8d. per 1,000,000 gallons of sewage treated, or 1s. 9d. per ton of cake produced.

Sludge cake to the amount of 14,264 tons was consigned to farmers for manurial purposes, but the income received from this source was only £189 17s.; 24,704 tons of sludge cake was tipped on low-lying lands to an average depth of about 6 ft., and covered with a layer of soil.

The total cost of sludge removal after deducting the above-mentioned receipts from sale of cake amounted to 4s. 8d. per 1,000,000 gallons of sewage, or 9d. per ton of cake produced.

BY-PRODUCTS.

Experiments have been conducted with a distillation plant for testing the practicability of recovering by-products in the form of ammonia liquor and grease from the pressed cake, but up to the present the process has not yielded any satisfactory results. Another patented process for the treatment of the liquid sludge produced in the tanks has been considered, but the experiments conducted upon the Leeds sludge have not convinced the committee that this process can be satisfactorily adapted for their sludge.

The total working costs (exclusive of interest and sinking fund) amounted to £1 19s. 1d. per 1,000,000 gallons of sewage treated, as against £2 1s. 8d. for the previous year.

"The results obtained from the present precipitation process show that the dry-weather flow of sewage is being efficiently clarified, but that the impurities which are contained in solution render the effluent liable to putrefaction."

It is impracticable to improve the quality of the present precipitation effluent, until the bacteria beds, which are embodied in the sewage works extension, are constructed.

The total average daily volume of liquid trade wastes discharged into the sewers was estimated at 3,550,794 gallons from 147 connections.

"There are now in operation 91 settling tanks for preliminary treatment upon manufacturers' premises, and 54 of this number are now under the control of the corporation in so far as the regulation of flow is concerned by means of manholes fitted with locked inspection chamber covers, the keys of which are kept in charge of the sewerage department."

EAST SUFFOLK ROADS.

COUNTY SURVEYOR'S REPORT.

At the recent meeting of the Roads and Bridges Committee of the East Suffolk County Council, the chief county surveyor, Mr. W. Jervis, presented his report on the main roads of the county during the past financial year. This stated that the roads were severely tested by the long continuous drought, and the roadmen were heavily taxed in endeavouring to keep the surface intact. Despite the attempts that were made, unavoidable and rapid disintegration of the surface took place on some roads, and material had to be transferred and all efforts concentrated in repairing and strengthening such sections.

Following the exceptional conditions obtaining in the summer, the continuous wet weather had a disastrous effect on the roads. The trying circumstances were further aggravated by falls of snow, with intermittent frosts of the severest kind experienced for years. In fact, but for the determined and zealous work of the committee in formulating a scheme to deal effectually with certain sections of road which in winter could not better be described than by the word "quagmire," it was difficult to imagine what would have been the result on some roads had not the small reconstruction scheme been approved and sanctioned. Fortunately, the Road Board came to their assistance, and the year marks an epoch in the history of the council's work, firstly, by the introduction of a new Government Road Department, and, secondly, by the strenuous efforts made by the committee in taking the first step to raise to a better standard the important lines of communication in the county. The reconstruction of the Ipswich-Norwich road and a portion of the Ipswich-London road were works of a very important nature, and special attention had to be given to the organisation of the work, having regard to the fact that simultaneously with the concentration of all available funds on the work referred to, sufficient material had to be purchased and used to maintain the remaining mileage of roads sufficient to check any latent defects and to give the necessary stitch in time. It was gratifying, however, to report that all difficulties were surmounted and the work completed within the estimated cost, and the grants received.

The report concludes with a tabulated statement of the mileage, materials used, and the cost (excluding salaries) of the main roads maintenance directly by the county council for the past twenty-two years. This showed that, in 1891, the mileage was over 171¼ miles, the cost £4,589, giving a rate per mile of £26·72, while in 1912 the mileage was 306, the total cost £36,480, a rate per mile of £119·23. The average rate per mile during the twenty-two years was £47·68.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE, WEST HAM: PRELIMINARY NOTICE.

The annual conference of the Municipal Tramways Association (Incorporated) will be held in West Ham on September 25th, 26th and 27th next. De Keyser's Hotel, Victoria Embankment, E.C., has been selected as headquarters for delegates, and the following programme has been arranged:

September 25th.

10.15 a.m.—Reception by the Mayor and West Ham Council.

10.30 a.m.—Presidential address by Mr. H. E. Blain, tramways manager, West Ham.

Paper: "Tramway Administration by Municipalities: A Retrospect and a Forecast," by Mr. Councillor S. C. T. Neumann, deputy-chairman Bradford Tramways Committee.

1 p.m.—Luncheon.

2 p.m.—Proceed to Tramways Depot, Greengate-street, Plaistow, by special cars.

2.15 p.m.—Discussion on the interim report of the Corrugation Committee.

3.30 p.m.—Inspection of depot and of the Exhibition of Tramway Appliances, &c.

7.30 p.m.—Corporation reception at the town hall.

September 26th.

10 a.m.—Paper: "Tramway Fares and their Basis," by Mr. W. J. McCrindle, tramways manager, Hull.

12.15 p.m.—Luncheon.

1.15 p.m.—Proceed by special cars to tramway depot.

1.30 p.m.—Meeting of managers' section.

1.30 to 3 p.m.—Inspection of depot and Exhibition of Tramway Appliances.

3 to 5 p.m.—Garden party in West Ham Park.

7 for 7.30 p.m.—Association dinner at the Liverpool-street, Hotel, E.C.

September 27th.

9.45 a.m.—Annual business meeting at De Keyser's Hotel.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
Secretary.

11 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

HIGHWAY SURVEYOR.—August 24th.—Watford Urban District Council. £150—£180.—Mr. W. Hudson, clerk.

CLERK IN HEALTH DEPARTMENT. — August 26th.—Corporation of Burnley. 21s. per week.—Mr. P. Thomas, town clerk.

ASSISTANT INSPECTOR.—August 26th.—Depwade Rural District Council.—£60 a year.—Mr. A. E. Scarlett, clerk, Pulham Workhouse, Harleston.

ASSISTANT SURVEYOR.—August 26th.—Ilkley Urban District Council. £70 per annum.—Mr. F. S. Eckersley, clerk.

CLERK OF WORKS.—August 26th.—Southport Education Committee. £2.—Mr. J. Ernest Jarratt, town clerk.

GENERAL WORKING FOREMAN.—August 26th.—Milton Regis Urban District Council. 27s. per week.—Mr. J. Dixon, junr., clerk.

ROAD FOREMAN.—August 29th.—Barnstaple Rural District Council. 25s. per week.—Mr. R. E. C. Balsdon, clerk, 109 Boutport-street, Barnstaple.

INSPECTOR OF NUISANCES.—August 29th.—Barnstaple Rural District Council. £100 per annum.—Mr. R. E. C. Balsdon, clerk.

ASSISTANT WATERWORKS ENGINEER.—August 31st.—Corporation of Madras. £26 13s. 4d. per mensem, and allowance for motor bicycle.—Messrs. James Mansergh & Sons, agents, 5 Victoria-street, Westminster, London, S.W. Envelopes to be superscribed "Waterworks Assistant."

SURVEYOR.—August 31st.—Bishop's Castle Town Council. £80 per annum.—Mr. E. Griffiths, town clerk.

SURVEYOR AND INSPECTOR.—August 31st.—Barton-on-Humber Urban District Council. £90—£100.—Mr. G. H. Nowell, clerk. Envelope to be endorsed "Inspector and Surveyor."

JUNIOR ASSISTANT.—August 31st.—Corporation of Bolton. £70 per annum.—Mr. Samuel Parker, town clerk.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

SURVEYOR.—September 2nd.—Holme Cultram Urban District Council.—Mr. J. H. Gibson, clerk, Wigton. Applications to be endorsed "Surveyor."

ARCHITECTURAL ASSISTANT.—September 2nd.—Hereford County Council. £150 a year.—Mr. G. H. Jack, county surveyor.

ASSISTANT BOROUGH SURVEYOR.—September 4th.—Douglas Town Council. £100 per annum.—Mr. Alexander Robertson, town clerk.

CLERK OF WORKS.—September 5th.—Corporation of Abergavenny. £3 3s. per week.—Mr. W. H. Hopwood, town clerk.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

LLANELLY.—September 30th.—Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium.—Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

ERPINGHAM.—August 24th.—For the construction of two automatic flushing chambers, for the rural district council. Mr. J. T. Willis, deputy clerk, Cromer-road, Sheringham.

MANCHESTER.—August 24th.—For repairs to various bridges, for the corporation.—Mr. Thomas Hudson, town clerk.

PORTSMOUTH.—August 26th.—For the erection of a store, for the Education Committee.—Mr. A. H. Bone, surveyor, Cambridge-junction, Portsmouth.

DUBLIN.—August 26th.—For the erection of stables, for the corporation.—City Architect.

NELSON.—August 26th.—For the erection of sanitary conveniences, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

POOLE.—August 26th.—For the erection of a disinfecting building, and alterations to laundry at isolation hospital, for the corporation.—Mr. S. J. Newman, borough surveyor.

GATESHEAD.—August 26th.—For the erection of entrance lodge at cemetery, for the corporation.—Mr. N. P. Pattinson, borough engineer.

CONSETT (Durham).—August 27th.—For alterations at the town hall, for the urban district council.—Mr. J. J. Eltringham, architect and surveyor, Derwentstreet, Blackhill.

KEIGHLEY.—August 27th.—For the erection of a cubicle isolation pavilion to contain twelve beds, for the Joint Hospital Board.—Mr. N. Clarkson, clerk, 40 North-street, Keighley.

NEWPORT (Mon.).—August 27th.—For the erection of a shop, for the corporation.—Mr. A. A. Newman, town clerk.

BUILTH WELLS.—August 28th.—For the erection of a fire station, for the urban district council.—Mr. T. Smith, town surveyor.

ALFORD (Aberdeen).—August 28th.—For additions to a school, for the School Board.—Mr. J. Reid, clerk, Brainley, Alford.

ESSEX.—August 28th.—For widening St. Stephen's Bridge, at Coggeshall, for the county council.—Mr. Percy J. Sheldon, county surveyor.

ESSEX.—August 28th.—For widening Springfield Bridge, at Chelmsford, for the county council.—Mr. Percy J. Sheldon, county surveyor.

GLAMORGAN.—August 28th.—For the erection of a school at Bettws, near Bridgend, a school at Blaengwrach, near Neath, a school at Pontlliw, near Pontardulais (removal of temporary building from Gorseinon and foundations for same), a mixed school at Trebanos, near Pontardawe, and other works, for the county council.—Mr. T. Mansel Franklen, clerk.

CHELMSFORD.—August 28th.—For the extension of the fire engine station, for the corporation.—Mr. W. Smith, town clerk.

BRANDON AND BYSHOTTLES.—August 29th.—For the construction of concrete walls and the erection of a steel footbridge, for the urban district council.—Mr. A. A. Luxmoore, 5 North Bailey, Durham.

BARNET.—August 29th.—For pulling down premises and clearing a site, for the urban district council.—Mr. H. W. Poole, clerk.

HERTS.—August 29th.—For alterations and additions at a public school, for the Education Committee.—Mr. Urban A. Smith, county surveyor.

GLASGOW.—August 29th.—For the erection of public baths, for the corporation.—Mr. J. Lindsay, town clerk.

NORTHWICH.—August 29th.—For the erection of baths and wash-houses, for the urban district council.—Mr. J. A. Cowley, clerk.

WELLINGTON.—August 29th.—For taking down and rebuilding a bridge, for the rural and urban district councils.—Mr. W. Sydney Price, clerk to the rural district council, Wellington, Somerset.

PORTLAND.—August 29th.—For the erection of a pumping station and cottage, for the urban district council.—The Clerk.

KIRKCALDY.—August 30th.—For extensions to generating station, for the corporation.—Mr. W. L. Macindoe, town clerk.

STAFFS.—August 30th.—For the erection of a school, for the Education Committee.—Mr. G. Balfour, County Education Offices, Stafford.

TIPTON.—August 31st.—For building engine and boiler house, for the urban district council.—Mr. S. O. Stephenson, engineer, Gasworks.

SWINTON.—August 31st.—For the construction of a wall across a reservoir, for the urban district council.—Mr. W. T. Postlethwaite, clerk.

HYDE.—August 31st.—For building public hall and police courts, for the corporation.—Mr. J. Diggle, borough surveyor.

MINEHEAD.—September 1st.—For building a convenience and cloak-room, for the urban district council.—Mr. L. C. Webber-Incledon, clerk.

MIDLOTHIAN.—September 2nd.—For works at new police station, for the county council.—Mr. A. G. G. Asher, county clerk, County Rooms, Edinburgh.

ABERDEEN.—September 2nd.—For the extension of the fish market, for the corporation.—Mr. W. Dyack, burgh surveyor.

MALDENS AND COOMBE.—September 2nd.—For the extension of the mortuary, for the urban district council.—Mr. R. H. Jeffes, clerk.

COTTINGHAM.—September 2nd.—For the erection of a parish hall, for the urban district council.—Mr. J. S. Moss-Blundell, clerk.

BARNET.—September 3rd.—For building twenty-two cottages, for the urban district council.—Mr. H. W. Poole, clerk.

MERTHYR.—September 3rd.—For the erection of girls' school and domestic subjects block, for the Education Committee.—Mr. E. Stephens, clerk.

JARROW.—September 3rd.—For the erection of a public convenience, for the corporation.—Mr. J. S. Weir, borough engineer.

CARMARTHEN.—September 3rd.—For extensions to a school, for the Education Committee.—Mr. W. Vincent Morgan, county architect, County Education Offices, Carmarthen.

KENT.—September 4th—21st.—For the erection of a school, for the Education Committee.—Mr. W. H. Robinson, architect, Caxton House, Westminster.

WEST RIDING.—September 6th.—For the erection of two new schools, for the Education Committee.—Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

HACKNEY.—September 12th.—For extension to electricity works, for the borough council.—Mr. W. A. Williams, town clerk.

BRADFORD.—For constructing new staircase at town hall, for the corporation.—Mr. F. Stevens, town clerk.

Iron and Steel.

BLACKBURN.—August 24th.—For the supply of castings and valves, for the corporation.—Mr. W. Stubbs, borough engineer.

MANCHESTER.—August 24th.—For the supply of one Lancashire boiler, with superheater, mechanical stoker, fuel economiser, and steam and feed pipes, and two sets of vertical steam pumping engines, for the corporation.—Mr. Thomas Hudson, town clerk.

SWINDON.—August 24th.—For the supply of wrought-iron fence, gate and posts, for the corporation.—Mr. R. Hilton, town clerk.

CHELMSFORD.—August 28th.—For laying water mains, for the corporation.—Mr. W. Smith, town clerk.

ROTHERHAM.—August 28th.—For the supply of cast-iron mains, for the Gas Committee.—Mr. C. L. Des Forges, town clerk.

SUNDERLAND.—August 29th.—For the supply of smith's work, including staircases, handrails, and chequered plating, for the corporation.—Mr. F. M. Bowey, town clerk.

LEICESTER.—August 31st.—For the supply and erection of steel roof trusses, lattice girders and columns for the extension of the main car depot, for the corporation.—Mr. E. George Mawbey, borough engineer.

BLACKPOOL.—August 31st.—For the supply of Sandberg steel tramway rails, for the corporation.—Mr. J. S. Brodie, borough engineer.

Roads.

BURNLEY.—August 24th.—For paving and making up, for the rural district council.—Mr. H. Prichard, surveyor.

SWINDON.—August 24th.—For making up with tarred stone and asphalt, for the Hospital Board.—Mr. G. Adams, clerk, 4 Crickdale-street, Swindon.

PRESTWICH.—August 24th.—For private street works, for the urban district council.—Mr. L. A. Orford, clerk.

EDINBURGH.—August 24th.—For granite-sett paving work, for the corporation.—Mr. T. Hunter, town clerk.

NELSON.—August 24th.—For work in several streets, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

HARROGATE.—August 26th.—For drainage and road-making works at the cemetery, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

ALTOFTS.—August 26th.—For the construction of a new footpath, for the urban district council.—Mr. A. E. Greaves, clerk.

CHESTER-LE-STREET.—August 28th.—For making up several streets, for the urban district council.—Mr. J. Gray, clerk.

FELLING-ON-TYNE.—August 28th.—For making up a macadam road, for the urban district council.—Mr. C. W. Hall, surveyor.

SOUTH SHIELDS.—August 28th.—For repaving certain streets with granite setts, for the corporation.—Mr. Leslie Roseveare, borough engineer and surveyor.

BASINGSTOKE.—August 28th.—For work of steam road-rolling, for the rural district council.—Mr. H. Wills Chandler, clerk.

NEWHAVEN.—August 29th.—For the supply of flake granite or broken Kentish ragstone, for the rural district council.—Mr. H. W. Coupe, clerk.

CHICHESTER.—August 29th.—For making up with granite macadam about 10,000 super. yds. of London-Portsmouth road, for the corporation.—Mr. J. W. Loader Cooper, town clerk.

CASABLANCA.—August 29th.—For the improvement of several roads, for the Special Committee of Public Works.—The President, Comité Special des Travaux Publics, Dar En Niaba.

ALFORD.—August 29th.—For the supply of 700 tons of broken granite and screenings, for the urban district council.—Mr. T. N. Loy, clerk.

SALTASH.—August 29th.—For works of making up and widening, for the urban district council.—Mr. F. E. Cleverton, town clerk.

EAST BARNET.—August 29th.—For the supply of broken granite, gravel, hoggin, Portland cement, stoneware pipes, tar-paving materials, oats, hay, straw, horse hire and cartage, for the urban district council.—Mr. T. A. Buckley, clerk.

WALTHAMSTOW.—August 30th.—For the supply of Trinidad asphalt macadam and Trinidad Lake bitumen, for the urban district council.—Mr. E. Morley, surveyor.

CLAYTON-LE-MOORS.—August 31st.—For granite kerbing and paving, for the urban district council.—Mr. A. Dodgeon, surveyor.

DORKING.—August 31st.—For surfacing with slag tar-macadam, for the urban district council.—Mr. W. A. Clegg, borough surveyor.

BLAYDON-ON-TYNE.—August 31st.—For making up a road, for the urban district council.—Mr. H. Dalton, clerk.

CASABLANCA.—August 31st.—For the construction of public roads, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LITTLEHAMPTON.—August 31st.—For the supply of Guernsey or other granite, for the urban district council.—Mr. H. Howard, surveyor.

SAFFRON WALDEN.—August 31st.—For the supply of granite macadam, for the corporation.—Mr. A. H. Forbes, borough surveyor.

SUTHERLAND.—August 31st.—For reconstruction and improvement of county roads, for the county council.—Mr. A. Argo, county clerk, Golspie.

LOUGHTON.—August 31st.—For the supply of granite, gravel and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

SANDWICH.—September 2nd.—For the supply of granite, granite chippings and channelling, for the corporation.—Town Clerk.

BOLTON-UPON-DEARNE.—September 2nd.—For street-making work, for the urban district council.—Mr. J. L. Hawksworth, clerk.

SUNBURY-ON-THAMES.—September 2nd.—For steam rolling and scarifying, for the urban district council.—Mr. H. F. Coales, surveyor.

CAERPHILLY.—September 2nd.—For the supply of 1,000 tons of 2-in. granite, for the urban district council.—Mr. O. H. Harpur, clerk.

BROMLEY.—September 2nd.—For the hire of a steam roller, for the rural district council.—Mr. Edward Haslehurst, clerk.

BROMLEY.—September 2nd.—For the supply of road materials, carting and team labour, for the rural district council.—Mr. Edward Haslehurst, clerk.

MIDDLETON.—September 3rd.—For making up a road, for the corporation.—Mr. W. Welburn, borough surveyor.

SOUTHAMPTON.—September 3rd.—For private street works, for the corporation.—Borough Engineer.

HOVE.—September 4th.—For paving and other works, for the corporation.—Mr. H. Indacott, town clerk.

SKIPTON.—September 4th.—For the construction of a roadway, for the urban district council.—Mr. Prichard Wilson, clerk.

SOUTHEND-ON-SEA.—September 6th.—For road and formation works in connection with the construction of a boulevard 1¾ miles in length and 100 ft. wide, for the corporation.—Mr. H. J. Worwood, town clerk.

HANWELL.—September 7th.—For wood paving a portion of Boston-road, for the urban district council.—Mr. Percy Scott, clerk.

BEDLINGTON.—September 9th.—For making up a certain street, for the urban district council.—Mr C. D. Forster, 24 Grainger-street West, Newcastle-on-Tyne.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. AUGUST 30, 1912. No. 1,076.

Minutes of Proceedings.

Points from the Road Board's Report.

The extracts from the Road Board's annual report which appeared in our issue of last week were sufficient to show in broad outline the great importance of the matters which are engaging the Board's attention. The report contains, however, a large amount of matter which does not lend itself either to quotation in "chunks" or to broad generalisations. The Road Board is a central department dealing in a very direct manner with intimate matters of road administration and maintenance. The result of this condition is that single and apparently small points in the Board's annual report may be of far-reaching significance and importance. One of the most interesting matters engaging the attention of the Board during the past year has been a statistical comparison between two periods, during both of which there was an increase in the cost of road maintenance. The figures reveal, however, a condition of affairs which is hardly what one might expect from recent statements with regard to the increase in the cost of road maintenance due to motor traffic. The figures to which we allude are these: In the period from 1890 to 1902 the average increase per cent in the annual cost of maintenance of urban roads was 9·5, while in the period from 1902 to 1909 it was 1·85. These figures may, perhaps, be sufficiently explained by a general advance in the public demand for improved street conditions and better road accommodation generally in urban and semi-urban areas. The same cannot be said, however, as regards rural roads. On these roads the average increase per cent per mile in the annual cost of maintenance was 5·75 in the former period and only 2·42 in the second period from 1902 to 1909, though this may be called the period of motor traffic during which, it is usually assumed, the increased cost of road maintenance has mainly been felt. The point is so important that we defer it for further consideration, only noting in passing that a large amount of the recent increase in the cost of road maintenance is certainly due to motor traffic.

Other figures which might at first sight convey an erroneous impression if read without taking other matters into consideration are those giving the cost of roads per £ of assessable value and per head of population. The rate per £ in extra-Metropolitan county boroughs was, in the year 1909, 5·58 pence; while in the administrative counties it was 14·2d. in the same year. Allowing for Exchequer contributions, and assuming that these amount to 50 per cent in the counties and about 11 per cent in the boroughs, the expenditure per head of population was about 24d. in the boroughs and 36d. in the counties. At first sight this seems unfair on the counties, but we have only to go back to the essays which we all wrote on this subject when at school to realise that the advantages and disadvantages of living in a town or in the country result in some things costing more and others costing less; and a scattered population necessarily pays more for its roads, just as the condensed population pays more for its houses. The summaries of traffic returns from the counties of East Sussex and Kent are extremely interesting, and if studied in connection with a map of each county should furnish employment for the leisure moments of surveyors for some weeks to come, if surveyors have any leisure moments. The motor traffic varies from about 7 to 91 per cent of the total in East Sussex, and from 8 to 75 per cent of the total in Kent, and further study of the returns themselves shows that there are many spots in these counties where the proportion of motor traffic exceeds 40 per cent, and not very many where it is less than about 14 per cent. These figures convey information of some little value, but they are not worth much in comparison with the information which will be derived from studying a considerable number of the actual entries with a map showing not only the position of the station with respect to the towns and villages in the county itself, but also its position with respect to those lines of through traffic with their many small deviations radiating from London to the coasts of Kent and East Sussex. These figures show something of the nature of the traffic in the area lying between London and those portions of the South Coast which are thickly dotted with towns considered to rank high as health resorts and offering attractions as pleasure resorts, every one of them lying within a day's trip of London, there and back, by motor car. Doubtless the Road Board will receive information which will make it possible to publish in future annual reports, or better still, in special reports, similar traffic tables for areas beyond the ebb and flow of London's motor cars, and representative of conditions in counties which are intersected by great main roads, as well as those in which the proportion of through traffic is small.

We cannot allow the occasion to pass without expressing our appreciation of the skilful manner in which really important facts and figures have been selected for inclusion in a report of moderate length and of much more than ordinary vitality. We do not see eye to eye with the Board with regard to the use of bituminous binder, which is referred to in the report as though it had proved successful generally on roads of many different classes, and all over the country. We also deprecate the use of the expression "recoating" with a context which suggests an attitude towards the improvement of

the road bed which is very far from that really taken up by the Board. The suggestion that road crusts on heavily trafficked roads should be bound "not with mud but with bituminous materials" is one which we much regret to see in this generally well conceived and very valuable report. If it is the opinion of the Board that these roads should be forthwith bound with bituminous binder, or as occasion for recoating arises, there is no reason against this being made a recommendation in their report; but the expression "not with mud" is hardly justified, having regard to the ordinary practice of road surveyors in the British Isles.

* * *

Wiltshire Roads: Matters of Engineering.

The sharp changes which occur when a road passes from a chalk or limestone subsoil into softer strata like those of the weald clay and greensand have furnished Mr. Powell, to whose interesting annual report we made some references in last week's issue, with opportunities for making valuable comparisons. The differences, he finds, may amount to 30 or 40 per cent *less*, which we understand is measured against 100 per cent in the case of the higher cost, implying that the more costly roads involve an expenditure of from 43 to 66 per cent *more* than those on the favourable subsoils. We direct the attention of the committee on Communication 9 (Road Congress) to these figures, and hope that Mr. Powell may be able to give some actual cases of the kind desired by the committee, and, if the data are available, to estimate what reduction of the excess cost could be brought about by some definite expenditure per mile of capital spent on reconstruction.

We welcome the term "enveloping" as expressing very neatly that position and nature of hedge growth which results in the hedges "shading and excluding wind and sun" from the surface of a road, but we would suggest that the best measure of the height of a hedge is that given by some angular elevation measured from the edge or middle of the carriageway; a 4-ft. hedge close to the carriageway cuts off drying currents more than does an 8-ft. hedge beyond a 10-ft. margin. A very good practical point, referred to by Mr. Powell, is the importance of the surface drainage of a clay subsoil. The importance of draining a really stiff soil by surface grading is often overlooked, and another point that does not receive sufficient attention is the significance of the different capacities for the absorption of water exhibited by different kinds of "stiff" soil. We recently compared weald clay with a red marl, and we are glad to find that the matter had already received attention from Mr. Powell, who compares an impermeable clay with a retentive but also absorptive silt.

Probably the most generally interesting passage in the report, at any rate as far as surveyors in the flint-bearing areas of the South are concerned, is that relating to the substitution of flint road crusts for those previously made with limestone. Mr. Powell states the advantages of a flint crust fairly enough, and if it lasts as long as the limestone crust the saving is about £50 per mile on secondary or tertiary roads of an ordinary width. If the crust be renewed every two and a-half years, say, the saving is £20 a year. But what about the wear and tear of boot leather and bicycle tyres and tubes? In some kinds of wet weather the flint road is a very reliable and safe one for cycling, but we fancy that most cyclists would, on the score of expense, vote for limestone in preference to flint roads.

* * *

The Ottawa River Survey.

The sanitary survey of the Ottawa River made by Mr. James O. Meadows on behalf of the Board of Health of the Province of Quebec is described more fully elsewhere in the present issue. This report is a further example of the excellent work which is being done by the Quebec Board of Health. There can be no question as to the practical utility and need of surveys of this kind. The Ottawa river is typical of many others, which in their original state afforded safe sources for domestic and municipal water supplies, but the very fact of houses and towns being built upon the banks of the rivers means that the rivers will be polluted, and that if care is not taken this pollution is very likely to reach the waterworks intake and cause trouble. The report brings forward very clearly the fact that the water in a river may be perfectly pure above and below a township and of enormous volume compared with the flow of sewage from that township, yet, as shown in the case of the Ottawa River, serious epidemics of typhoid are likely to occur and recur unless care is taken to keep the waterworks intakes well away from that portion of the river which is polluted with the town's sewage. The fact is no doubt obvious enough after it has been pointed out, but one can see how easily and insensibly a dangerous condition arises, owing to the growth of a town, to its better drainage and to unsuspected river currents and eddies. We are told that where epidemics of typhoid have occurred each municipality has polluted its own water supply while the intervening stretches of the river have remained pure. The pollution has in these cases been purely local, but the water has happened to be drawn from the polluted section.

This sanitary survey should be an object lesson to many places, and it emphasises the importance of continual vigilance with regard to all sources of water supply. Pollution of all kinds must increase with the population, and no source can ever be considered absolutely safe from the possibilities of contamination in the future. Watchfulness and prompt action in case of need would save many lives, and if a greater factor of safety were allowed in all cases it would be advantageous. Both at home and abroad it is customary to wait until the water actually shows signs of pollution before steps are taken to improve the quality of water. This is quite inexcusable, seeing that it is possible to purify the worst water. The recommendation that mechanical filtration should be generally adopted is to be commended, as this would introduce a proper safeguard, while it is of course the obvious duty of the various authorities to see also that they obtain their water from as pure a source as possible.

Electrolytic Disinfectant.

We have been favoured with a copy of the annual report for the year 1911 of Dr. F. W. Alexander, the medical officer of health to the metropolitan borough of Poplar, and a perusal of this very interesting volume reveals a year's steady work and progress in regard to the public health services in a peculiarly difficult district. The public health department of this borough has acted as a pioneer in respect of the use of electrolytic disinfecting fluid for various purposes, and it may be within the recollection of our readers that we have from time to time recorded in these columns the success which has attended the use of this inexpensive and efficient disinfectant. During the year 1911 the total output of the fluid amounted to 53,063 gallons, the cost of materials being only £108. This quantity is sufficient not only for the use of the public health department and the various institutions under the control of the council, but it also allows an unlimited amount of the fluid to be supplied free of charge to the institutions of the Managers of Sick Asylums and the Board of Guardians. One of the most interesting uses to which the fluid is put is that of purifying the water of the swimming baths. The testimony of bathers is that the addition of the electrolytic disinfectant in such a quantity as to produce one part of chlorine to 2,000,000 parts of water imparts a freshness which is entirely lacking in ordinary swimming-bath water. The bath superintendents, too, repeat their statements that the addition of the fluid prevents the formation of slime in the water, and that when the baths are emptied for cleansing there is no objectionable deposit or

offensive smell. The importance of this result is manifest when it is remembered that any scum or deposit which forms in a swimming-bath forms a very favourable breeding-ground for many kinds of disease germs. The use of the electrolytic fluid was commented upon some time ago by Dr. J. Graham Forbes in a paper on the serious evils and dangers lurking in swimming-baths which he read before the Association of School Medical Officers. Dr. Graham Forbes expressed surprise that after the electrolytic process of manufacturing hypochlorite of magnesium has stood a successful trial of six years in the borough of Poplar adverse criticisms have not ceased to be made. The experience gained in this trial would appear to be a conclusive proof of the practical value of the process, and we cannot help thinking that when the lurking evils of the public swimming-bath are fully realised many other boroughs will profit by the enterprise of Poplar and will avail themselves of a remedy which has been demonstrated to be both efficient and economical.

* * *

Irish and Scottish Roads. Owing to the fact that the Grand Juries had no powers to buy road machinery or plant, the only steam rolling done in Ireland before the institution of county councils in 1899 was that which was carried out with hired rollers in a few important counties. There has been, moreover, very strong local opposition to the use of the steam roller—an opposition which is now giving way before the evidences of good work performed by this valuable machine in those counties which have adopted direct labour, as well as in others in which the old contract system has been modified to an important extent. In Scotland the steam roller was strenuously opposed for a time, but all districts, even in the remote Highlands, have now fallen into line, and a very great improvement in the roads has been effected. An important impetus was given to roadmaking and improvement by the passing of the Road and Bridges Act of 1878, before which nearly all the main roads of Scotland were turnpike roads. The above facts are among those set forth in two interesting papers submitted to the annual meeting of the Institution of Municipal and County Engineers, "Some Notes on Road Maintenance in County Armagh," by Mr. R. H. Dorman, M.Inst.C.E., county surveyor, and "Scottish Roads," by Mr. Allan Stevenson, county road surveyor, Ayr.

Mr. Dorman's contributions to the general stock of knowledge in highway engineering are as conspicuous for the clearness with which they are presented as for the value of their subject-matter, and we trust that none of our readers will make the mistake of supposing that in the present case the paper may be passed over as though it applied only to Irish conditions. Similarly in Mr. Stevenson's paper on "Scottish Roads" it will be found there is a good deal that is of general interest. Space does not allow of discussion of the matters dealt with in these papers, but we may in passing note as highly significant the fact that traction engines may be taken all over Scotland without a licence and on any highway, however unsuitable it may be for such traffic; and we may note, too, that Mr. Stevenson raises a point which is of considerable importance in remarking that motor vehicles, which are only allowed by law to travel at 5 miles an hour, are frequently driven in excess of that speed.

* * *

A Year's Work in Johannesburg. The last annual report of Mr. G. S. Burt Andrews, M.Inst.C.E., the town engineer of Johannesburg, shows that the phenomenal growth of this interesting town has not yet been arrested. The number of buildings erected during the past year is the greatest for any year since 1905, which may be regarded as the height of the boom in building in the town. The buildings which are now being constructed are frequently of a modern substantial type, and there is a gratifying tendency to abandon the erection of wooden houses. The increase in the number of substantial business premises which are being erected away from those thoroughfares in which the principal trade of the town has been carried on hitherto is specially noticeable. This development of building enterprise has created fresh problems for Mr. Andrews and his staff. In regard to road construction, for example, it is being found that the increase of heavy motor and general vehicular traffic is such as to bring upon the old highways a burden which they are not fitted to bear, and it is evident that the council will soon have to embark on a scheme for the creation of a more substantial class of roadway in the central area of the town. This scheme is necessitated by two circumstances. In the first place the cost of maintaining the existing roadways is becoming prohibitive, and in the second place the comfort and convenience of the public demand a class of highway which can be kept in a condition more fit for general use than is practicable at the present time.

Another section of Mr. Andrews' report, some account of which will be found in another column, deals with the water supply of the town, which is derived in bulk from the Rand Water Board and supplied to customers by means of the council's mains. The problem of waste has in the past been one of some difficulty, and it is satisfactory to observe that the percentage of wastage has been considerably reduced by a thorough system of night inspection by means of waste-water meters. British municipal engineers will thoroughly appreciate the difficult nature of Mr. Andrews' task in supervising the growth of such an important town as Johannesburg, and will continue to watch with interest the development of the various public services for the administration of which he is responsible.

* * *

Indian Students. The recent appointment by the Government of an official whose special duty will be to watch over the interests of Indian students in this country affords a fresh reminder that an English education confers considerable prestige upon the practitioner in any profession in the Eastern Empire. The number of Indians studying in England at the present time is enormous, as will be shown at once by a visit to any of our great centres of learning. In the engineering profession the need for practical training and experience to supplement the theoretical work of the college has led to a desire on the part of many of these students to complete their education in this country by serving articles under an English engineer. The ambition of most educated Indians is to obtain a Government or civic appointment, and it is evident that a term of service in the office of a municipal engineer is the most appropriate training for those who wish to get engineering posts of this kind. It is not surprising therefore that applications are frequently received from Indian students requiring attachment to municipal engineers for the purpose of gaining practical knowledge in municipal engineering generally, and in many cases with the special purpose of passing the examination of the Institution of Municipal and County Engineers. That body is accordingly taking steps to bring together such students and those municipal engineers who have works in construction and who are desirous of taking a pupil. To this end a circular letter (which was referred to in THE SURVEYOR of August 9th, p. 217) has been sent to the members inviting them to communicate with the secretary on a form which is attached to the circular, and on which particulars of the premium, the period of articles, and the nature of the works in hand are required to be given. The Institution are to be commended for taking up the matter, and it is to be hoped that the result of their action will be the mutual benefit of the members and the students concerned.

Sanitary Survey of the Ottawa River.

QUEBEC BOARD OF HEALTH'S OBJECT-LESSON.

The seventeenth annual report of the Board of Health of the Province of Quebec contains a description of the sanitary survey of the Ottawa river recently made by Mr. James O. Meadows, engineer to the Board. It is based upon the results of the survey and also upon data obtained from previous local studies. The discharge of sewage, trade wastes and refuse into the river at points above waterworks intakes has been specially considered, and their relation to typhoid fever and to the public health generally is discussed.

In order to secure the analytical data necessary, two trips were made down the river from Pembroke to Montreal. The important municipalities were visited, and information was secured as to their sanitary condition, while steps were also taken to obtain similar information from the other towns bordering on the Ottawa river.

The Ottawa river has its source in lakes. It is 700 miles long, and has a total watershed area of 56,000 square miles. The upper part of the river flows through a granite plateau, and the country is low and marshy. Below this area the river falls rapidly. There are many lakes, having a total area of several hundred square miles, in the upper area. From Pembroke to Ottawa the river is a series of lakes separated by rapids. The total population of the watershed is estimated at about 500,000. Within a radius of 10 miles at Ottawa are the municipalities of Aylmer, Hull and Ottawa, having a total population of over 100,000. Only about 20,000 of the remaining population of the main river have sewer outlets, while the urban population on the tributaries is small, and very few of the municipalities discharge sewage into the rivers.

RIVER POLLUTION.

It is argued therefore that the great percentage of the urban pollution occurs at or near Ottawa. The maximum recorded flow of the Ottawa river is 76,000 cub. ft. per second, and from this it is calculated that the flow of the stream, as compared with the flow of sewage from the population of Ottawa and the vicinity is 760 cub. ft. per second for each 1,000 of the population. With a minimum flow the comparison is 150 cub. ft. per second for each 1,000 of the population.

The chief manufacturing plants on the banks of the river are for making pulp, paper, sulphite and matches, and the combined waste from these is very small when compared with the volume of the river. The principal industries are lumbering and agriculture.

It is shown in the report that in several cases those towns which have the most polluted water supplies and the highest typhoid death-rate have done nothing yet to improve the quality of their water supplies. The water at Pembroke, Ottawa, Westmount and Montreal is purified with calcium hypochlorite, while at Verdun pressure filters are in use. The quantity of water consumed per head by the population actually using the water varies considerably at the various cities and villages. For instance, the amount consumed per head per day is 128 gallons at Pembroke, 46 at Arnprior, 75 at Aylmer 249 at Hull, 181 at Ottawa, 25 at Rockland, 75 at Hawkesbury, 246 at Lachine, 100 at Westmount, 34 at Verdun and 86 gallons per head per day at Montreal. Speaking generally, the largest cities have the largest supplies per head, but it is to be noted that Pembroke, with 4,700 consumers, and Lachine, with 10,150 consumers, use far more water per head than Montreal with its 450,000 consumers.

UPPER AND LOWER REACHES COMPARED.

The Ottawa river from Pembroke to Ottawa receives the domestic sewage from a combined population of not over 15,000, and the towns discharging sewage between these two points are well separated, and the nature of the river makes purification by natural agencies possible. The germ content of the river above Ottawa is comparatively low, except where polluted for a short distance by local sewers, and in most cases B. coli were absent in 1 cubic centimetre. Bacterial examinations were made. With regard to the severe typhoid epidemics which have occurred at Pembroke, Hull and Ottawa, the report states that these were due to each municipality infecting its own supply.

Below Ottawa the germ content of the river increases perceptibly owing to the sewage of Ottawa and the vicinity entering the river. The population being over 100,000, the amount of pollution must be considerable. The increased germ content of the river water is present below Ottawa all the way to the Lake of Two Mountains, but this lake acts as a natural settling basin, and a decided decrease in germ content is noted after the river water has passed through it. It is to be observed also that several municipalities below Ottawa discharge their sewage into the river. With regard to the sterilising plants installed at Pembroke, Ottawa and Montreal, we are told that these are temporary in character, and have been installed to treat the water till more permanent works are constructed. The result of this sterilisation has been to reduce the typhoid fever rates at these places materially. The city of Montreal is constructing filtration works of the double filtration type, while Mr. Allen Hagen has recommended a supply of water from McGregor Lake for Ottawa, or filtration of the river water, and Pembroke has extended its water intake 7,000 ft. to take water from mid-stream. It is hoped in this way to escape the eddies which were held responsible for the severe epidemic of 1909. Interesting diagrams are given which show how the bacterial content of the water was reduced to practically *nil* at Montreal by means of hypochlorite, and how it was reduced to something like from ten to fifty on an average per cubic centimetre at Verdun by pressure filters, although it is to be noted that in the month of April this figure rose to over 200. The need for the purification of water is shown in a table of typhoid death-rates in the year 1910, which in two cases are as high as 100 and 116 per 100,000.

CONCLUSIONS.

The conclusions are to the effect that the river above Ottawa is pure, except where polluted for a short distance by municipal sewers. Each town seems to have polluted that part of the river from which it drew its supply. Further, it is considered improbable that the amount of pollution of this upper section of the river will increase perceptably for a considerable period of time.

Ottawa and Hull pollute the river for a considerable distance below, so that the section from Ottawa to St. Anne de Bellevue is unfit for use in its raw state.

Mechanical filtration is recommended owing to the high colour content of the river water, in order to secure a water of good appearance and bacterial purity. It is recommended that the sewage of Ottawa and Hull should be purified. The amount of manufactory waste entering the river is too small to create any nuisance, and is not likely to increase. It is expected that the construction of the Georgian Bay Ship Canal will have a considerable effect on the river. In some cases additional pollution is likely to occur, but it is probable that by equalising the flow of the river the maximum pollution which occurs at low stages of the river will be prevented. The Ottawa river, being an interprovincial stream, is outside the jurisdiction of either province, and this suggests federal authority and sanitary control over waters which do not lie entirely within the limits of one province.

Refuse Destruction at Cromer.—A new refuse destructor at Cromer has recently been completed, and was used for the first time last week. The method of disposal at Cromer has hitherto been to tip the refuse into a disused clay pit at Felbrigg. A convenient site for the new plant has been obtained. The destructor and chimney have cost £1,146, and with the tip roadway, fencing of site, laying on of a water service, and other incidentals, the whole cost will not exceed £1,500, which is the amount of the loan sanctioned. The furnaces are of the front-feed type, and are capable of burning 6 tons in ten hours, more than sufficient for all requirements during the season. The contractors for the work were Messrs. Dawson & Manfield, of Manchester.

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

The second day's proceedings in connection with the recent annual meeting of the Institution of Municipal and County Engineers included the consideration of the following paper:—

SOME NOTES ON ROAD MAINTENANCE IN COUNTY ARMAGH.

By R. H. Dorman, M.Inst.C.E.,
County Surveyor.

In this paper the author desires to give some account of the rate of progress in respect to road maintenance, and to describe briefly some of the methods adopted for the improvement of the roads in recent years in County Armagh. Previous to the passing of the Local Government Act (Ireland), 1899, the road authority for each county in Ireland was the Grand Jury, which body was empanelled twice a year for the consideration of criminal and fiscal business, but after transacting the business laid before them they were discharged and had no further jurisdiction until called together again at the next assizes, the sole authority in charge of the roads in the interval being the county surveyor. The Grand Juries, not being corporate bodies, had no power to purchase road machinery or plant of any sort; as a consequence, until the duties of the Grand Juries in respect to road maintenance were taken over by the county councils under the Local Government Act, little progress could be made in matters of road maintenance, and it is not therefore surprising that the roads in Ireland were generally in a very indifferent state previous to the passing of the Act. In a few important counties a little steam rolling had been done by hired rollers, and in a few counties in which the traffic was light, and suitable material was available, it was possible to make fairly good roads, but as a rule the roads were bad, and among the worst were those in County Armagh. In this county, as in every other county in Ireland, the roads were farmed out to contractors, who took over the whole responsibility for their maintenance, but who, being for the most part quite ignorant of the best methods of maintenance, and having no rollers or other appliances, naturally failed to make any improvement in their condition, and in many cases, instead of improving them, let them go from bad to worse.

Unfortunately, the Local Government Act did not provide for any system of road maintenance except by contract, but in a year or two after the Act came into force a Provisional Order was passed authorising the adoption of direct labour. From the year in which this Order became law dates the first signs of rapid improvement in the condition of the roads in Ireland. Not that everything then was plain sailing, because the strongest opposition was offered to any change by the road contractors, who up to this period had a monopoly of the roads, and by many of the rural district councils in the country, which bodies are for the most part extremely conservative in matters of road maintenance, and view with suspicion any change from existing methods. A number of county councils, however, taking a broader and more comprehensive view of the subject than the rural district councils, succeeded in overcoming their opposition, and in introducing direct labour on the roads; other county councils, while not abolishing the contract system, modified the old system in many respects and introduced steam rolling and other modern methods; the remaining county councils, while still following the old lines, cannot fail to see the better condition of the roads effected by improved methods, and it is therefore only a matter of a little time before every county will have adopted better and more up-to-date methods of maintenance.

DIRECT LABOUR.

The County Council of Armagh was one of the first bodies to recognise the advantages of direct labour, and in 1907 they adopted the system for all the first-class roads in the county, and since then there has been a rapid and continuous improvement in their condition, with practically no increase in expenditure. The results have, indeed, been so satisfactory that some of the rural district councils are now eager to adopt methods of maintenance more in accordance with modern principles for their second and third class roads, and the county council has just purchased light rollers at the request of two of these councils for use on the by-roads in their districts. As soon as the first rollers and scarifiers were purchased in County Armagh, the author proceeded to scarify and reform the roads so as to bring them into shape, to a proper camber, and to a suitable width in each case. In some places the roads were hog-backed; in others they were concave; in some places too wide, in others too narrow. The hog-backed parts were scarified, sometimes 12 in. to 18 in. deep, and the road widened out and rolled; if there was any surplus material it was screened and utilised for filling up concave parts of the same road or an adjoining road.

Where the roads were too narrow, they were cut back, a little hard material put in along the sides and rolled, while where too wide, a sod kerb was laid along the existing surface to define the proper width, and some soil packed behind to form a margin. This work could only be accomplished by degrees as funds became available, and as the author succeeded in collecting and training a sufficient staff of foremen, surfacemen and labourers. At the end of five years, however, most of the first-class roads, embracing about 450 miles, had been more or less reformed. During this period no great effort was made to obtain material of the best wearing properties, the chief object being to get the roads into shape, and to roll in any fairly hard material, so as to form a sub-crust for a surface coat of harder material. Over a large portion of the county the only local stone available is a very soft limestone, but this, when broken to a 2½-in. to 3-in. ring and rolled in a thick coat from 4 in. to 5 in., makes a very compact sub-crust, and for light traffic it makes by no means a bad surface, if kept clean and not allowed to track. The roads having been got into some sort of shape, more attention had to be paid to the quality of the material provided and to the opening up of quarries containing suitable material. Not much difficulty was experienced in this matter, although in parts of the county it is impossible to obtain good stone of any sort locally; still, in other parts there is an ample supply of whinstone, hard slatestone, &c., so that the difficulty resolves itself into a question of transport over distances seldom exceeding 15 to 20 miles. In some cases also a large proportion of the stone can be conveyed to within carting distance of its destination by rail or barge, so that, for the most part, suitable stone can be laid down on the roads without the aid of a traction engine or motor. Whinstone usually costs from 2s. 6d. to 3s. 3d. in the quarries, and hard slatestone 2s. to 2s. 6d., and, when laid down on the roads, from 3s. to 6s. a ton, so that the cost of material cannot be considered excessive. In one large quarry, owned by the county council, consisting of hard slatestone, the [illegible] broken to 10¼ in. rings by hand to a 2¾-in. ring for 1s. 2d., run down a short length of tram line and loaded into railway trucks for 2d. a ton, then railed to Armagh, a distance of 10 miles, for 1s. 3d. a ton, making a total cost of 3s. 3d. a ton for the stone at 10 miles from the quarry.

In those parts of the district in which only soft limestone is available locally, a proportion of the stone is now being treated with a preparation of tar, and [illegible] a special plant was laid down for the treatment of the stone, and during the [illegible] were dealt with. This plant consists of a crane for lifting the stone from the quarry floor to a platform, from whence it is tipped into an open inclined channel, the floor of which is formed of iron plates, beneath which is the flue, extending from the furnace built at the lower end of the incline for the purpose of heating the stone. From the channel, after being sufficiently heated and dried, the stone passes into the mixer. This mixer is cylindrical in shape, and has tee-irons riveted on the inside at an angle, so that the stone, as it drops from the tail of the shoot into the mixer, is passed along the mixer as it revolves from the upper to the lower end, where it discharges into barrows, and is then conveyed to the stacking ground close at hand. As the stone passes through the mixer, the preparation of tar and pitch is added in the requisite proportion from a tap

attached to a pipe leading from a tank in which the preparation is stored. The mixer is actuated by gearing after the manner of a threshing mill and driven by a pair of horses. This method of gearing and working the mixer is very simple and economical. A pair of light horses are quite able to drive the machine, and when not working they can be immediately detached and put to other work. The plant was designed by Messrs. Goodwin & Barsby, of Leicester. No difficulty is experienced in working the plant, and it is, on the whole, very satisfactory. The total cost of the plant, including erection, amounted to £230. From 35 to 40 tons of stone can be treated per fine working day of ten hours, at an average cost of treating the stone of 3s. 2·4d. a ton, made up as follows:—

	£	s.	d.
Labour, 16 men at 2s. 2d. a day ...	1	14	8
1 foreman at 4s. a day		4	0
Horsework, 2 horses at 4s. 6d.		9	0
Oil			3
Coal, 5 cwt. of Scotch coal		5	0
Tar, 266 galls. of gas tar at 2d. per gall.	2	4	4
Pitch, 6½ cwt., at £2 10s. a ton... ...		16	3
Cartage of tar and pitch to quarry ...		5	0
Total cost of treating 37 tons of stone	£5	18	6

MATERIAL.

The author is a little sceptical about any great advantage to be derived from specifying that the material for the surface crust shall consist of stone of varying sizes, such as 60 per cent of 2½-in. gauge, 30 per cent of 2¼-in. gauge to 1¼-in. gauge, &c. He considers it of much more importance that the stone should be broken cubical, and instead of having a large proportion of fine stone, he would like all the stone spread off for the roller to lie between 1¾-in. and 2¾-in. Stone of this size, of average hardness, spread off in a 4-in. coat, on a lightly scarified surface, rolls in very tight, and no apparent voids will be found in the coat.

QUALITY OF MATERIALS.

The principal varieties of stone available for road metal in County Armagh are whinstone, slatestone, and limestone, of varying degrees of hardness and toughness; but coarse-grained granite, elvanite, and felstone, &c., are also to be found in places. In the southern portion of the county stone is to be found, probably of Silurian origin, but which has apparently been subject to metamorphic action, so hard and tough that it is only raised with extreme difficulty and cannot be broken by hand except in small quantities. This stone, if broken to a small gauge, would doubtless make a very perfect and durable road, but when broken to a 2½-in. to 2¾-in. gauge, and rolled in, it wears into a very rough surface, very unpleasant to travel over. The same remark applies to coarse-grained granite when broken to a large size; but this material when broken fine, although it makes a smooth, even surface for very light traffic, is quite unable to carry heavy traffic, and wears very quickly. For ordinary purposes of comparison, the relative values of Armagh limestone, slatestone, and whinstone may be taken as one, two, and three—that is to say, average samples of these several varieties may be selected, and it will be found that they will, when used as road metal, approximately wear in the proportion of one, two, three. Of course, it will be found that a hard slatestone will wear better than a soft whinstone, and a good limestone better than a soft flaky slatestone; but the figures given above are fair average values. It does not follow, however, that in all cases a stone should be chosen for road metal because it seems to be the most economical when considered on the basis set out above; for instance, the price of whinstone on a particular road may be 9s. a ton and limestone 4s., or it may be only 2s. 6d. a ton, but it should not therefore be assumed that whinstone should be selected in the first case and limestone in the second, there are many other factors to be considered in each case besides wearing properties, for example, in strengthening and making up a bad road in the first instance, it will generally be economy to use a large quantity of a cheap and poor kind of material to put body into the road rather than a small quantity of material of better quality; on the other hand, no practical man would think of coating or repairing a whinstone road with soft limestone, no matter what the relative prices. Other factors to be considered in the selection of a stone are the traffic over the road on which it is to be used, the amount of mud and dust created, the road foundation, the subsoil, the drainage, the situation, and the gradients. A few examples will suffice to show why these items should be taken into account. On a heavily trafficked road, a hard wear-resisting material is, of course, required even if the cost is out of propotion to inferior material. In populous districts and roads carrying motor traffic the creation of mud and dust has to be carefully avoided. In the case of a bad foundation or a weak subsoil, cross breaking and shearing of the weak surface crust is liable to occur, so that a material which will roll down into a close compact mass, and will resist cross breaking better than a substance like hard slatestone, which has little binding properties in itself, should be used. On the other hand, on a badly drained road, soft limestone would wear out very rapidly, while the increased wear of slatestone in such a position might be hardly noticeable. Again, considering the situation and gradients of a road. On a high, wind-swept road, or a hard, steep gradient, a road coated with a stone possessing little binding properties would rapidly break up and go to pieces in dry weather, while a limestone, if used, would probably be hardly affected by these circumstances. The matter of foothold is another item which has to be taken into consideration in selecting material, and one on which a whole paper might be written.

STEAM ROLLING.

The Armagh County Council now own eight rollers, and a ninth has been ordered. Five of these rollers weigh 10 tons each, one weighs 12 tons, and two 7 tons each, these latter being for use chiefly on bog roads and on second and third class roads. The 10-ton rollers have been found heavy enough for the work required from them up to the present, but as the roads are becoming stronger and a better class material is being provided, it is found that better and tighter roads can be made with heavier rollers, and therefore when the present 10-ton rollers are worn out the author hopes to see them replaced by 12½-ton rollers on the leading roads, except, of course, when a special binder is used, which can be better treated with a light roller.

In Ireland the use of special binders is only in the experimental stage, and it seems probable that for some years to come, in order to save initial expenditure, the majority of the roads will continue to be water-bound except in or adjacent to the larger towns or on some of those roads towards which a grant in aid is made for improvement by the Road Board. The author will therefore direct his remarks chiefly to the steam-rolling of water-bound roads, referring only incidentally to such roads under his control as have been treated with special binders. There is a vast difference between a rolled road which has been reformed, coated with hard metal of uniform quality, well dry-rolled, bound with a small proportion of clean road scrapings, and finished off with screened chippings, and an ill-formed road on which a coat of indifferent metal is thrown, smothered with mud, and finished off any way; but it is remarkable how much of this bad work is carried out in many places. This sort of work is frequently to be found in Ireland on roads in the hands of contractors, who are insufficiently supervised, the chief object of a road contractor being, of course, to save expense by getting the roller which he has hired from the county council off a road as soon as possible, and so he lumps down the stone in a heavy coat, half dry-rolls it, flings a quantity of mud over it, and washes it in, no attempt having been made to reform and bring the existing surface to a proper camber in the first instance. Another cause of bad rolling is the incapacity of those in charge of the rolling operations. A capable assistant or foreman who knows his work will insist on a road being properly finished off, but too often the man in charge, while he thinks he knows all there is to be learnt about steam rolling, really knows very little about it; he has not mastered the little details which are the essentials of good rolling. To ensure good rolling, it is generally necessary to more or less reform the existing surface of a road before spreading on any stone. Sometimes the necessary work will entail heavy scarifying, reforming, screening and/or the renewal of the old material; most times only a little light scarifying and reforming is necessary, occasionally only a little picking here and there. As a rule, it is advisable to reform the old surface to bring it to the same camber as the finished surface, the sides to the same level, and to lightly dry-roll before spreading off the new coat.

The thickness of a new coat of unrolled stone

should not exceed 4½ in. or 5 in. at the outside; such a coat when rolled in will be from 3½ in. to 4 in. thick. When the new coat has been spread off it should be thoroughly dry-rolled, and as any slacks or depressions show they should be made up and the whole surface brought to a uniform camber of 1 in 30. This cross fall should not be judged entirely by the eye, but should be checked by means of a template and spirit level. After the stone has been thoroughly dry-rolled a very small quantity of clean road scrapings should be spread off, watered, and swept in, a quantity of chippings (about 1 ton to every 12 tons of stone), when available, should then be applied, and the rolling continued until a firm, hard, and tight surface has been obtained. After the operation of rolling has been completed the author has been in the habit in many cases of spreading off a quantity of screened chippings on the finished surface; these chippings prevent the surface breaking up after being rolled should very dry weather occur, but as they are quickly swept away by rapid motor traffic, and are also injurious to rubber tyres, he is discontinuing the practice.

Some short lengths of roads have been laid down with tar-macadam in County Armagh, and some experiments have also been made of grouting surfaces of newly-laid stone which have been dry-rolled with Tarvia, and from the experience so far gained the author is entirely in favour of tar-macadam over grouting with tar; he is, however, decidedly opposed to the finishing off the surface with a veneer of tar; undoubtedly this practice may result in roads of greater wearing properties, and which are practically dustless, as compared with roads without this veneer, but it can never give a satisfactory foothold in all conditions of weather.

No preparation has yet been introduced which makes an ideal binder for roads, and it is questionable if a perfect binder will ever be produced. A road possessing the rigidity of cast-iron is not a perfect road for traffic, while there must be set up in any road crust of broken stone bound with a substance possessing a certain amount of resilience or elasticity more or less internal stresses and friction under the jar of traffic, which will result in ultimate disintegration. The author, however, looks on a road crust composed of broken stone set in a firm but slightly elastic binder, and with the stones showing on top, as the nearest approach that can be obtained to a perfect surface, and which most nearly meets the requirements of traffic on ordinary county roads.

ROAD BOARD WORK.

Before concluding, the author would like to give a brief description of the work carried out in County Armagh, with the assistance of grants in aid from the Road Board, and his appreciation of the very great benefits to be derived from these grants. His only regret is that the total annual grant to Ireland, which contains a mileage of roads far out of proportion to other portions of the United Kingdom, and where the roads are the chief, and in many places the only, means of communication, should be so small. Last year the amount allotted to County Armagh was £2,700, and the county council, after setting aside £200 for work in the urban districts, applied the balance to the following works of improvement.

No. 1. To reconstruct, widen and steam roll 66½ perches of the road from Dublin to Derry between Armagh and Moy, £2,533 5s. 3d.

No. 2. To scarify, reform and make up 400 perches of road from Dublin to Belfast between the county Louth and Newry, £529 2s. 3d.

No. 3.—To render the drainage complete, scarify, reform and roll 200 perches of the road from Belfast to Armagh between Portadown and Armagh, £533 6s. 8d.

These several works have been carried out by direct labour and completed in a satisfactory manner, and are permanent works of improvement, which it is probable would never have been attempted by the county council and the district councils concerned without the assistance of the Road Board. The most important of these works—that is, the reconstruction of the Armagh to Moy road—involved the lowering and strengthening of a bog rampart, and was a difficult and troublesome piece of work. In order to test the relative values of tarred local limestone, whinstone and slatestone, this length of road was divided into three sections, one section coated with tarred limestone, and the other two with whinstone and slatestone respectively untreated. No appreciable difference is yet noticeable in the wearing properties of these several materials, but it will be interesting to note their ultimate values on this road.

For the current year the Road Board have allotted £1,400 towards works of improvement on the scheduled roads in County Armagh, and of this sum the county council have approved of £1,200 being expended on the following works:—

No. 1.—For draining, scarifying, reconstructing, strengthening and coating with whinstone and slatestone, 300 perches of the road from Armagh to Belfast, at an estimated cost of £1,172.

No. 2.—For widening the metalled portion of carriageway, strengthening and surfacing with whinstone, and draining 200 perches, also of the Armagh and Belfast road. Estimate, £768.

No. 3.—For strengthening, surfacing with slatestone, improving gradients, draining and reforming footpath on 88 perches of the road from Newry to Dublin. Estimate, £619.

These several lengths of roads will be finished with water-bound macadam, except in the case of No. 1, a portion of which will be treated with Rocmac, and a smaller portion which it is proposed to try with another proprietary article as an experiment. It may be asked why the county council are not treating the whole of these lengths of roads with tar or some other special binder. The answer is that the author has advised his council to render the drainage of the roads complete, to strengthen the foundations, and to improve the gradients of the roads where necessary before going to great expense in putting on an improved surface coat; and also to experiment to some extent in the first instance, and ascertain definitely by trial what is the best and most economical material and system to adopt before launching out into any particular method of resurfacing on new lines, which might not eventually prove satisfactory.

DISCUSSION OF MR. DORMAN'S PAPER.

Mr. E. Purnell Hooley (Notts), in proposing a vote of thanks to Mr. Dorman, said he did not know whether all the members were aware of some of the difficulties they had in Ireland in connection with roads. If not it might interest them to know that many things which were perfectly simple here were sources of great difficulty there. It was quite within recent years that it was illegal to use a steam roller in Ireland, and when he read in the paper that Mr. Dorman had nine rollers he realised the struggle he must have had to persuade his council to purchase them. They had not had the steam traction engine there yet, however. If they saw Mr. Dorman's roads they would agree they were roads to be proud of; they were, indeed, excellent. Mr. Dorman had faced the situation with courage, and it was greatly to his credit that he should come to England to show how things were being done in Ireland. Mr. W. H. Leete (Bedfordshire), seconding the vote of thanks, said he had the pleasure of attending the first road conference held in Ireland, and it was interesting to learn from that that the Irish road surveyors had only just begun to use the steam roller.

The President (Mr. R. J. Thomas) put the vote of thanks, and it was carried. Adding his personal thanks to Mr. Dorman, Mr. Thomas said it was always interesting to know what other people were doing, and they had there an example of what could be done with very small funds. This was rendered possible to a very large extent by the extraordinarily low prices of material. They found that in Ireland material was delivered at 2s. 6d. and 3s. 6d. per ton which in England cost 19s., 20s. and 22s. per ton. That was a great contrast, and he noticed also that the price of labour was most extraordinary—2s. 2d. per day. The price of horse work, too—he presumed a horse and man was meant—was 4s. 6d. per day. It was fortunate for those in Armagh that they had these conditions, and were thus able, with a comparatively small amount of money, to effect the improvements they had had described to them. Some of the roads in Armagh were excellent, but the roads in Ireland generally were very much behind the times, owing to the old-fashioned administration which had hitherto prevailed. But at the Road Congress one had been able to understand the enormous amount of energy which the Irish surveyors had put into their work, and it was the duty of English engineers to help them all they could to make up for the defects of the past.

Mr. Dorman, in replying, said he might say that his first knowledge of road making was acquired in Middlesex, where he served under the present city

surveyor of Manchester. In Ireland he had a very uphill battle, as they all did there, but he found if they persevered with their work and pegged away, in the end the district councils and county councils had confidence in them, and instead of opposing everything would begin to support them and back them up.

The following paper next came before the meeting:—

SCOTTISH ROADS.

By Allan Stevenson.
County Road Surveyor, Ayr.

This subject is a wide one, and the author must deal with it in very general terms. The variety of the physical features of Scotland demand provision of roads suitable for the traffic of each district—on the one hand numerous manufacturing industries and large centres of population, and on the other hand large areas sparsely populated with no industry except agriculture. Notwithstanding the extensive system of roads which the country possesses, due in a great measure to its mineral resources, the roads would be altogether inadequate now to meet the requirements had not the railway system come into existence in the first half of last century.

Prior to 1878 the main roads were nearly all turnpikes, one or two counties excepted. These turnpike roads were maintained from the revenues of the turnpikes or toll bars, but as soon as the railway system extended, the traffic on the roads, except for short distances, decreased, and the revenue for their maintenance diminished. In the author's experience of turnpike roads the varying quantities of traffic and revenue produced an irregular and inefficient system of maintenance, there being sufficient revenue from some tolls to maintain the roads from which it was raised, but more frequently their revenue was altogether inadequate to maintain them. A system such as this could not make for uniformity in upkeep; hence a few roads were in a good and the remainder in a poor condition.

In every county there were also a large number of roads of secondary importance, maintained by what was termed "Statute labour," but these roads were only kept in such repair as to be passable, and so as not to draw away the traffic from the toll bar. About the middle of last century "Statute labour" was abolished, and an assessment levied in each parish instead. These times are now passed, and the abolition of turnpike and "Statute labour" took place on the passing of the Roads and Bridges (Scotland) Act, 1878. The revenue for the maintenance of all the highways throughout Scotland is raised by assessment, one half payable by the owner and the other half by the occupier. For the management of the highways, councils are elected in each county, and these councils are again subdivided into district committees where the counties are large. The rates of assessment vary in each county and district according to its requirements and the importance of the highways. As surveyors, we have no concern regarding the finance but only in the expenditure, and our aim should be to do the best we can with the revenues at our disposal and to meet the requirements and demands of the times in which we live.

The first means of locomotion to cause more attention being given to road surfaces were the bicycle and road locomotive—the one light and easy, the other the reverse. In nearly all counties in Scotland at this period the metal was spread upon the roads in beds in a loose manner in the autumn season, and the traffic during winter consolidated it into the road surface, so that in spring it was fairly smooth if it had been properly attended to. This system practically prohibited bicycle traffic during the autumn and winter, and counties, through the voice of public opinion, had to find other methods for consolidating the new-laid road metal. The introduction of the steam road roller brought a great and beneficial change in road maintenance, giving at once a smooth and finished surface and an improved and comfortable road for the traffic. In many districts the steam roller was strenuously opposed for a time as being a waste of material by crushing it in the process of rolling, &c., but all have fallen into line, even in the remote Highland districts. From the introduction of road rollers onwards immense improvement had been made in the general condition of highways. The recent introduction of the motor car has, however, completely altered the whole of the system of road maintenance, and counties have now, in order to meet this traffic, to face the question of bringing up the standard of all the roads, more particularly through main trunk roads, to carry traction engine and motor traffic of various kinds by widening, draining, strengthening, selection of better material for maintenance, consolidation of the new surfaces, binding material, and last, but not the least difficult, the laying of the dust.

While it is undoubted all these works, properly carried out, will lengthen the life of and bring the highways into a much better condition for all traffic —particularly motor car traffic—there is a very restraining element to contend with—namely, the cost of attaining this ideal—as the average ratepayer has a strongly rooted objection to contributing to any increased cost for a traffic with which he has no sympathy.

So long as counties are responsible for the maintenance of the roads, and one county has a high assessable value and another a low assessable value, the improvement of the roads will not proceed in a uniform manner. So far, however, as circumstances permit, the desire for improvement of the highways is, the author thinks, general all over Scotland. Ever since the Road and Bridges Act, 1878, came into operation in this county, numerous improvements have been made in cutting hills and levelling up hollows to improve gradients, widening portions of highways, opening out curves, widening and rebuilding bridges, &c. This work all tends to the comfort of the users of the road, but a great improvement still remains to be carried out. This applies to all counties.

The largely increased cost necessary to maintain the main trunk roads in a state to suit the motor traffic of different kinds must at no distant date become acute, and the necessity of considering some means whereby a contribution for direct maintenance be made from those creating the increased cost appears only fair and reasonable. From what source this is to be obtained the author does not stop to inquire.

Every district in Scotland for the past few years has been experimenting with materials for laying the dust and increasing the life of the road treated, but in only a few counties has a bituminous binder been applied on an extensive scale, the cost in most other instances being the deterrent.

Although all this work is in an experimental stage at present, there is no doubt statistics will shortly be available to show that by the adoption of certain methods certain results will follow. Everything is being carried out to the advantage of the user of the road by self-propelled traffic; some provision is also being made for the humble individuals who have been compelled in a measure to forsake the highway, by the provision of footpaths for their use. Many new and improved footpaths are being laid in populous places, and these add to the comfort of the inhabitants.

Since the Imperial Road Board was created and grants given towards various works for the improvement of main trunk roads, such as draining, widening, strengthening of the crust, improving of the corners, &c., a good deal has been done in many counties. It was thought by many in Scotland these grants should be made by the Road Board to cover the entire cost of any of the above or other approved improvements, but the board have decided that the counties must contribute a proportion of the cost. Much can be said in favour of this method as stimulating a more active interest by counties in seeing the grants are judiciously employed in making real improvements; but, on the other hand, it forms a seriously increased expenditure if the improvements are extensive.

Around large cities and burghs with large populations the counties are strengthening and improving the surface of the road by the use of tar-macadam, tar-grouting, tar-spraying, and in various other ways. In villages and on other main roads in the country districts similar improvements are being carried out, all for the purpose of extending the life of the roads and the laying of the dust.

On account of the climatic conditions in Scotland, there should be experiments made all over the country and careful statistics prepared with the view of obtaining a better knowledge of the best materials to use under given conditions. These experiments, if carried out by the Road Board, would educate and encourage counties in dealing with the question of maintenance in an economical manner and bringing the road surfaces into good condition.

While giving all attention to the improvement of road surfaces, another form of traffic arises to destroy them viz., motor char-a-banc and commercial motor

traffic. These means of locomotion will, with the improved roads, increase in number, and the life of the maintenance of the highways be correspondingly shortened. Since the introduction of motor car traffic the life of the ordinary maintenance without special treatment of trunk roads has been reduced from a life of eight to ten years to a life of four to five years, and in some cases less. The rate of expenditure has increased in this county during the last ten years by fully 30 per cent, and the experience of other counties in Scotland is similar. If this special traffic increases in the same ratio as it has done in the past, county rates cannot maintain the roads in good condition without obtaining some relief from the burden thrown upon them of providing for a traffic they do not create. The traffic was until recent times comparatively local and circumscribed, but in these times it may be in the South of Scotland to-day and in the North of Scotland to-morrow. Formerly the traffic was slowly driven, now it is driven at a legalised speed of 20 miles an hour, and, be it observed, the speed is frequently very much greater. The same remarks apply to motor traction with the legalised speed of 5 miles per hour.

In one district in Ayrshire motor wagons with a load of 6 to 8 tons are a regular traffic. In damp or wet weather, or after frost, this traffic in a few days destroys the surface of the road, upon which a very heavy expenditure is annually made. This traffic is carried on in competition with railways. The latter have to purchase land and equip their own road under Acts of Parliament, whereas the traffic by motor wagons, although legalised on the highways, does not contribute to their maintenance, and the county is therefore contributing to the profits of the owners and bearing the cost of the highway maintenance. Contributions should come from this traffic towards the additional cost incurred by the use of the highway, and the same remark applies to all heavy self-propelled traffic.

Traction engines are not licensed in Scotland, and can move to any part in one county and from one county to another without a permit, and also on any highway, however unsuited to carry that traffic.

The author trusts some points may arise from these notes which may be the means of a little profitable discussion.

DISCUSSION OF MR. STEVENSON'S PAPER.

Mr. W. NISBET BLAIR (St. Pancras), in proposing a vote of thanks to Mr. Stevenson, remarked that there were a number of points in the paper which would appeal to the sympathy of them all, especially the reference to the influence of motor traffic and the cost of attaining the ideal road to accommodate it. The paper pointed to the fact that the increased cost of upkeep was due to motor traffic, which, though something was now paid through the petrol tax, some of them got nothing out of. London, for instance, had not received a cent from the Road Board fund. However, they were hoping that something might be put aside to go towards the cost of the enormous highways, east, west, north and south, which were to cost so many millions each. Gentlemen in the provinces did get some share of the petrol tax, but they had to charge their rates with more than would be the case if they did not receive it. Some argued that this was an unfair condition; on the other hand, some said it was a wise provision, as it showed that the authorities were spending the money, and, on the whole, it was perhaps not unreasonable.

Mr. W. HARPUR (Cardiff), seconding the vote of thanks, expressed sympathy with Mr. Stevenson in the matter of the objection of the ratepayers to paying for the increased cost of road maintenance due to the new methods of traffic. A good many people did not appreciate the difference in the cost of maintaining roads now and in former times. At the same time, there could be no question that motor traffic of one kind or another had come to stay. They had roads to keep in proper condition for that traffic, and it was a pity that local authorities were slow to see the necessity for that.

Mr. A. H. CAMPBELL (Edinburgh), in supporting the vote of thanks, said he had been rather hopeful of hearing some of the English county surveyors on this question of highways construction. In Scotland they regarded Mr. Stevenson as probably their leading exponent of county highway construction and maintenance. Some commiseration had been exercised for Ireland, but he had not yet heard the voice of sympathy for their position in poor old Scotland. Those who shouted the loudest usually got the most, and if they had in the "gasworks" a little further along the road as much patriotism as regarded Scotland as they had for Ireland, then he thought Scotland would get more than she did. Undoubtedly, the problem was as acute in Scotland as it was in Ireland, and perhaps more so, for this reason. Ireland was divided by the sea from the rest of the British Isles, and that kept motors out, whereas only a bridge divided Scotland from England. What was the condition of things in that connection? They had the Highland glens sparsely populated, and the Lowland valleys where nothing but sheep could find a living; yet these were the great highways of communication between North and South. There were many miles without a house, and so what rateable value had they for the support of main roads in such places? And what had the roads to carry—what local traffic was there? A farmer's cart once a day, occasionally a milk cart; occasionally a farmer's wagon with potatoes—nothing at all in proportion to the through traffic. Yet these were the very conditions which Mr. Stevenson so well knew were a handicap on the efficiency of the maintenance of the highways—indeed, no subject was of such essential importance to Scotland as that of the recognition of the national character of the great trunk highways. It was a pity that Sir George Gibb had left the meeting. They were wishful to give him an opportunity of hearing some faint echo of the complaints from Scotland, and they hoped to draw from him, not only a word of sympathy, but promises of cash in aid of Scotland's highways.

Mr. E. J. ELFORD (Southend-on-Sea), commenting on Mr. Campbell's complaint of Parliament's apparent neglect of Scotland, suggested that that must be Scotland's fault, having regard to the fact that we were ruled by Scotsmen. (Laughter.) Mr. Campbell had referred to the character of the traffic on Scotch roads; but he made no mention of the vehicles which carried the national beverage. To speak seriously, he sincerely sympathised with the Scottish surveyors in regard to the unrestricted use of traction engines. Motor traffic did not contribute a substantial sum to the roads of the country, and for the life of him he could not understand why petrol-driven vehicles should contribute and steam vehicles get off scot free, for they were a great source of expense, especially in the rural districts.

Mr. J. S. BRODIE (Blackpool) said, as one who spent his annual holiday in the Highlands, he could bear testimony to the excellent state of the roads considering the limited funds at the disposal of the surveyors.

The PRESIDENT (Mr. R. J. Thomas) said they in England could sympathise with Scottish surveyors because they had similar troubles to face. He had traversed some admirable roads in Scotland. With all deference he submitted that Scotland depended very largely on the alien tourist, and when he went away he left his contribution towards the upkeep of the Scottish roads. In this world it was always a case of give and take, and in the matter of motor traffic they must not forget that, after all, in a tourist country they must allow that in proportion as they had better roads and better accommodation the tourist traffic increased. Scottish surveyors did their work thoroughly well, and with credit to themselves and to the admiration of everyone.

The vote of thanks was passed, and Mr. STEVENSON, in replying, said he was old enough in experience to have had the management of roads under the old turnpike system, and could recollect how absolutely insufficient was the amount of money which was derived from the toll bars for the purpose of keeping the roads in decent repair. He knew what it was to be without the aid of a steam roller, but county councils and other authorities were now very much more willing to provide mechanical appliances for the proper administration and maintenance of the roads, and they had also largely taken advantage of the Road Board grant. The result had been a great improvement in the roads. It had been remarked that when the motorist went to Scotland he left a contribution behind, but that was not rated, and in the sparsely populated districts, which were often those most favoured by the tourist, the ratepayers got no advantage from the contribution. Inns and shooting lodges contributed, but not in sufficient proportion. He was very pleased to have the sympathy of the English surveyors; he could only say that in Scotland they were trying to do all they could for the money that was available.

(To be continued.)

SOME RECENT PUBLICATIONS.

British Rainfall, 1911. Price 10s. London: Edward Stanford.

The fifty-first annual volume published by the British Rainfall Organisation makes a peculiarly appropriate appearance at the present time. The purpose of the work is to present to all who are interested in the subject as full an account of the rainfall of the British Isles for the year in question as it is possible to produce with the data and funds available. The organisation is entirely of a voluntary character, and the thoroughness with which the large staff of observers perform their self-imposed task is shown by the fact that for 1911 some 5,300 rainfall returns were received, of which some were incomplete, and a few obviously erroneous; but no fewer than 5,000 gave satisfactory figures of monthly rainfall, and 3,253 were complete as regards daily rainfall also. The greater part of the annual volume before us is occupied by the discussion of these data rather than mere tabulation. The book begins with the report of the director to the trustees of the British Rainfall Organisation. Following this there are three special articles illustrated by diagrams and maps, the third of which deals with the arrangement of rainfall stations, and is of great interest. The area of every river basin in Scotland and Ireland has been measured, and the areas of the portions lying in each county are given, similar information in regard to England and Wales having appeared in last year's volume. Then follows a statement of evaporation observations at twelve stations, and in this connection it is interesting to observe that, as was to be anticipated, the evaporation in London was greater in 1911 than in any previous year since the observations began.

The second part of the work commences with observers' notes on the days and on the year 1911 dealing chiefly with rainfall in its relation to other meteorological conditions and to agriculture. Much space is then occupied with the discussion of heavy rains on individual days, and detailed maps are given showing the distribution of rain on eleven occasions; this includes the calculation of the total volume of water which fell upon the land of the British Isles on several occasions, and some relationships with the meteorological conditions are pointed out. It is evident that the statistics which have been collected and so ably digested and commented upon in this volume will be of the greatest possible interest and value to those municipal engineers who are concerned with water supply undertakings, and we confidently commend it to their notice.

Ventilation of School Buildings.—New schools at [illegible] are being equipped with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

WORKMEN'S DWELLINGS AT THETFORD, NORFOLK.

Through the courtesy of the architect, Mr. Stanley J. Wearing, A.R.I.B.A., of 15 Upper King-street, Norwich, we are able to give an illustration of fifty cottages which the Thetford Town Council are about to erect in Bury-road, Thetford, under the powers conferred by the Housing of the Working Classes Act.

About 3 acres of land has been purchased and forms an excellent site, the cottages, some of which face the main road, and the remainder grouped round the new roads, being so arranged and planned that the living-rooms will obtain the sun at some time during the day. The walls are to be built of 9-in. brickwork, rough casted outside, and the roofs covered with pantiling. The accommodation in every case will be as follows: Entrance lobby, out of which the stairs lead, a living-room about 14 ft. by 12 ft., kitchen, store, larder, coals, closet, and three bedrooms 12 ft. by 11 ft., 11 ft. by 8 ft., 7 ft. by 8 ft. 6 in., and store on first floor. There will be no outbuildings with the exception of closets, thus leaving as much space as possible for gardens. A cooking range will be fitted in the living-room, and in the kitchen a sink, heater stove, and copper over, over which a patent hood will be fixed for conducting steam into a flue.

Each cottage will have an enclosed yard and garden at the rear, the fronts being formed with grass margins between the road and cottages.

Tenders for the work have been received from sixteen builders, and the lowest, that of Mr. E. Clarke, of Melton Mowbray, has been accepted. The cost per cottage works out at about £135, which includes the roads, sewers, drains and fences, paths, but not land, and after allowance for repayment of loans, insurance, repairs, empties, and so forth, in accordance with the Local Government Board's schedule, the scheme will be self-supporting at an average rental of 5s 8d per week.

Correction of Advertisement.—By an error which arose in the preparation of the notice sent to us, the age limit of intending applicants for the position of architectural assistant in the office of the county surveyor of Herefordshire—advertised in our issues of the 16th and 23rd inst.—was stated as 30 years, whereas the limit actually decided upon was 40 years.

Asylums and Prisons in Rural Districts.—"R.D.C. Surveyor" writes: Will you kindly allow me to enquire through THE SURVEYOR the names of any rural districts in which there is a Government asylum or prison? Perhaps the surveyors of any such districts will be good enough to send their names to you for me, and I will be much obliged to all concerned. Upon receipt by me of any letters I will acknowledge them direct.

Royal Sanitary Institute Congress at York.

ENGINEERING AND ARCHITECTURE SECTION.

Among the papers considered at the first sitting of the Engineering and Architecture Section of the Royal Sanitary Institute Congress at York was the following:—

THE PHYSICS OF AIR IN RELATION TO VENTILATION.

By A. Saxon Snell, F.R.I.B.A.

The movements of air and its behaviour under varied conditions have been patiently observed and recorded by scientists. As the results of intricate and costly experiments they have discovered definite laws, and expressed them in algebraic and mathematical formulæ of fearsome length and complication. Others (calling themselves "practical" scientists) have invented systems based more or less upon those laws. In this way their work, too, is not without value; but too often they are handicapped by a curious blindness to the defects of their systems, which seems to affect those who attempt to encompass things which are in their nature elusive. Many of these systems have been evolved as the result of concentration upon one or more of the laws which govern the movement of the air. Under given conditions they may act well, and can be proved by tests to supply air better, or at any rate freer from impurities, than that which is so bountifully supplied by Nature. But conditions vary, and ordinary people with a passion for fresh air suggest that purity (according to tests) is not the only essential quality in air.

The movement of air is affected by so many conditions and circumstances that it is, perhaps, impossible to design a system of ventilation which will automatically adjust itself at all times and under all circumstances. The most we can do is to provide the means (and they should be as simple as possible) for adjustment to meet all conditions, and to leave those occupying the building to make reasonable use of these means. . . . The object of this short paper is to draw attention to certain simple laws which govern the movement of the air, and to suggest that the best ventilation is secured by making the fullest use of them. . . .

HEATING.

We cannot treat ventilation and heating apart; they must always be considered as two parts of one subject. Within limits it is so; but we must beware lest acceptance of the proposition without qualification leads, through misconception, to error. Heating should be used first and foremost as a corrective to the effects of ventilation on temperature, and on occasion as an aid or stimulant to movement of air. . . . Given any volume of air, a change in temperature in one part immediately produces movement. The colder part being the denser at once descends by the force of gravity, and in so doing pushes up the warmer and lighter air. This is called the "law of convection," and, Dr. Shaw points out, it is the dominant physical law of ventilation. He emphasises it by several illustrations, showing how much more powerful it is than any movement induced by mechanical means. Realisation of this law is absolutely essential for any proper understanding of the process of natural ventilation.

CHANGES IN TEMPERATURE.

Changes in temperature may be produced in a room by many causes. When the air is heated it expands, though not to any great extent; and in so doing in a closed space causes a state of "plenum." With an outlet available the extra volume is released and equilibrium restored. The air left behind is still lighter than the outer air, and if an opening is made in the wall between them, the latter will by force of gravity enter and displace the former. Thus we have two natural forces to assist us in the removal of heated air. I take no account of a third, the action of the wind, because the problem of ventilation should not depend upon so variable a force. Necessarily, with one opening only, both incoming and outgoing air will be considerably throttled and the interchange slow. With two openings, one at the top and one at the bottom, the lower one would act as an inlet, and the upper mainly as an outlet. There would then be comparatively little throttling, and we should obtain something approaching continuous movement of air in the room. But cold air at the floor level and warm air above would mean for the occupants of a room cold feet and hot heads. The reverse is to be preferred, but the law of convection forbids. We can, however, effect a fairly successful compromise by placing inlets between the top and the bottom of the room (in practice about 7 to 8 ft. above the floor line), sheltered with hoppers to give an initial upward current to the air. The momentum of the incoming air is sufficient to direct the stream towards the ceiling, until it is overcome by the force of gravity, when it falls gently through the warmer air. In its fall it is met by the rising warm air, through which it filters downward, absorbing in its passage a little of the heat of the rising current. It will gather more heat from the bodies of the occupants. Every such accession of heat, of course, retards the tendency to fall, and in time reverses the current. Indeed, as Dr. Shaw found by interesting experiments, the current is almost immediately reversed upon coming in contact with warm bodies. Nevertheless, the bulk of the air will, in the absence of heat, at or about the floor line, continue to fall. Arrived at the floor line it will spread laterally. Theoretically, there it should remain in the absence of any access of temperature sufficient to cause it to rise again. That is not desirable, but, on the other hand, it should not be allowed (or at any rate be forced) to ascend again, because in doing so it would have a tendency to carry with it fine particles of dust gathered at the floor level. Therein lies one of the virtues of the ordinary open fire, which induces a strong current of air at or about the floor level.

OPEN FIRES.

We all know and have suffered from that strong drag of air along the floor, so powerful is the action of an open fire, and to counteract this a separate supply of air is often brought in at the fireplace to feed the fire, a practice which appears to me to be of doubtful value. It must be remembered that these distressing floor draughts are not caused by the air which is drawn down from the ventilators, but come direct from the outside of the room under doors and at window openings. The remedy is to close up these direct inlets at the floor level and to open the ventilators or windows wider.

Notwithstanding the powerful drag of an open fire, a certain part of the air will rise when its temperature is raised by contact with warm objects in the room. In larger rooms, too, it is necessary to supplement an open fire with radiators round the walls, and there also warm the air and thus lift it from the floor level; but I doubt the advantage of placing ventilating openings behind them.

Now let us follow up that part of the air which is expelled from the lungs and given off from the bodies of the occupants heated and contaminated. . . . If it is not drawn off at a sufficient rate, part of it comes in contact with the comparatively cool surface of the outer walls or windows, and as a consequence loses so much heat that the current is reversed downwards and close to the walls. Dr. Shaw suggests that under these circumstances air outlets should be provided at the level of the window sills. With all respect to so undoubted an authority, I cannot help thinking that in practice the system would not work. Under conditions which obtain more often than not in this country, these outlets would become inlets. Perhaps the best method of counteracting this tendency is to have an arched ceiling with the highest part at or along the centre, with an aspirating flue or flues at the highest part. I have adopted this system with the best results in hospital sick wards.

OUTLETS.

I have a great reliance upon an effective extraction shaft, and by "effective" I mean one which can be relied upon to act as such at all times. Only too often the ordinary short flue or the ornamental cowl either fails to act without the assistance of the wind, or it is overpowered by a more powerful draught in some other direction. A most satisfactory extraction shaft can be obtained in connection with a good and continuously used smoke flue. Another method is to have cross-ventilation by opening windows in

opposite walls. With these we obtain perflation, or a current of air travelling right across the room at a height which will not inconvenience the occupants, and which is generally powerful enough to sweep away the rising contaminated air in its course. Such currents of air are not entirely dependent on wind (indeed, air should not be driven across the room from one side to the other by the force of wind). They are due, I think, rather to the fact that there is always a difference in temperature (greater or less according to circumstances and aspect) between one side of a building and the opposite. It may be that the sun has warmed the walls one side more than the other at a given time, or that there is, for local reasons, a quicker movement of the air on one side or the other; or, again, that a strong current, blowing towards the building, may cause a slight vacuum on the opposite side. But, whatever the cause, the perflation thus secured is a valuable ally in ventilation.

Throughout I have dealt with conditions which obtain in cold weather, but, of course, ventilation is equally necessary in summer or warm weather. It is, or should be, a much simpler matter, because it is not complicated by the need of heating. On the contrary, we want at such times to keep the air in our rooms as cool as possible. It might be interesting to discuss the effect of the physical laws we have already considered under these different conditions; but the limits of this paper forbid. I need only remind you that we have the greater opportunities of flushing out our rooms by means of widely opened windows; and I may add a hint received many years ago from an old lady—*viz.*: "Close the windows on the sunlit side of the house, open widely those on the shaded side, and keep the chimney flues clear."

Perhaps inevitably I have been led to discuss methods of ventilation instead of confining myself to the physical laws which govern them; but these methods, regarded as illustrations of the effect of laws, help to explain them. In conclusion, I suggest to you that there are natural forces governing the movement of air upon which we can draw to an unlimited extent, and without cost, and that problems of ventilation will best be solved by studying these forces and making all possible use of them. I am firmly convinced that all attempts to secure ventilation by worrying and driving the air in neglect of or in opposition of those forces must fail in the end; or, if they succeed, it is at the expense of quality in the air. That, at any rate, is the lesson I read between the lines of Dr. Shaw's interesting notes of experiments and his electrical analogies, and of the lucid pages lightened here and there with the dry humour of Dr. Billings's work on "Ventilation and Heating."

DISCUSSION OF MR. SAXON SNELL'S PAPER.

Dr. Evans (Swansea) said the paper dealt with causes and not with results. It was air starvation that the people were suffering from. In the private Bill which the Swansea Corporation brought before Parliament two years ago they had a clause requiring that every building used for public purposes should be properly ventilated. He got little help from the committee, however, because the Local Government Board advised that the clause should be cut out, and as a matter of fact he was not allowed to give evidence.

Mr. S. H. Davies (York) said he approached the question from the point of view of the chemist, and in York he had had the opportunity of making a large number of air tests in connection with schools and factories, and he did ask that architects should be generous with regard to their testing of air. Architects had to design rooms not simply from the point of view of ventilation, but there were other considerations which governed them, and he would like to ask Mr. Saxon Snell what he would do with deep rooms which could not be dealt with by window ventilation. If they trusted entirely to window ventilation in a big room, especially in a factory, they were bound to have a very extensive heating area. They knew that many schools had been designed which were ventilated by windows only. In the Staffordshire type, for instance, they got cross-ventilation, but there were many schools built in which they could not get that cross-ventilation. One means adopted for ventilating was to use the heated air shaft. He thought architects ought to come and see these things afterwards, and find out how they worked, and very often they would find the air flowing in the opposite direction. In the case of a York school he had suggested putting a reversible fan at the base of the chimney, thereby absolutely promoting a forced draught. There was also the Plenum system, and he had found in rooms he had tested that from the CO_2 point of view they did get an advantage from the mechanical system. But in the Plenum ventilated school if a window in a classroom were opened there was a direct loss of air in every other room; but by having flaps over the inlets and outlets in the room in which the window was opened they could get over that difficulty. He thought that architects should co-operate with chemists in this matter.

Mr. Saxon Snell, in reply, said he cordially agreed that the architect and doctor and chemist should co-operate in such a matter. The great trouble where there were so many complaints about defective ventilation was that only one had been consulted. The architect, who thought he knew all about such things, put them in without understanding the seriousness of the matter. He was afraid that in many cases the doctor, with little knowledge of construction, but with many fine ideas about ventilation, would make equal failures. His advice to younger members of his profession had always been that the person who was going to live in a house was the person who knew what he wanted, and in the same way if he were designing a school or a public building he would go to the people who had to administer it. The great thing was to understand what the actual requirements were. In all these technical questions of ventilation and light they wanted the co-operation of men who had studied them, and certainly with regard to ventilation the chemist's knowledge was very desirable. He was asked what he would do in the case of a factory building, and he had already said that abnormal buildings required abnormal treatment. He would include a badly designed building as abnormal. He was not saying that mechanical ventilation was not good, but his view was that they should not design buildings which required mechanical ventilation. In the Staffordshire schools the point was dealt with. In the old central hall type of schools they could not ventilate properly, and the Plenum system was tried with a good deal of success. But do what they would with mechanical ventilation, it could not be so good or so economical as natural ventilation.

(To be continued.)

THAMES NEW SUBWAY.

WOOLWICH TUNNEL NEARING COMPLETION.

The new foot passenger tunnel under the Thames at Woolwich, which has cost the London County Council £86,000, will be opened to the public in October.

The scheme was first discussed by the council ten years ago. The ferry service, which had cost the old Board of Works £200,000, was often suspended in the winter owing to fog, with the result that men living on one side of the river and working on the other lost time and wages. The fogs in the winter of 1908 so seriously affected the ferry service that on one occasion it was entirely suspended for 112 hours, and numbers of men were thrown out of work. In the following summer it was decided to go to Parliament for power to build a tunnel.

The work was begun by the contractors early in 1910, and is now almost ready for opening, the construction having taken a shorter time than was anticipated.

The tunnel is 11 ft. 9 in. in diameter, is 500 yds. long, and passes under the river at the point where the free ferry crosses. A hundred and twenty-nine steps lead down from the surface on the north side to the tunnel, and about 100 on the south. As the work of climbing the stairs would be arduous, the council have installed lifts, at a cost of £5,000.

At first it was proposed to build the tunnel 30 ft. below low water, so as to allow a free passage for big ships. The Port of London Authority tried to compel the county council to drop it another 10 ft., which would have cost an extra £10,000. The council, however, decided to increase the depth by 3 ft., leaving 33 ft. of the river to be dredged above the crown of the tunnel.

The opening of the tunnel will considerably lighten the work of the free ferry, which carries vehicular as well as passenger traffic.

The maintenance of the tunnel and lifts will cost the council about £2,500 a year, but there will be a considerable saving by the curtailment of the ferry service.

CORRESPONDENCE.

"*Be calm in arguing; for fierceness makes Error a fault and truth discourtesie.*"
GEO. HERBERT, "*The Temple*"

BITUMINOUS ROAD MATERIALS.

To the Editor of THE SURVEYOR.

SIR,—With regard to the particulars published in your last issue of the discussion of Mr. Brodie's paper, "Suggestions towards a Standard Specification for Bituminous-bound Carriageways," which was considered at the annual meeting of the Institution of Municipal and County Engineers, might we be permitted to say that we thoroughly agree "as to the loose way in which the word 'bitumen' is being used"? As, however, nearly all the natural bitumen deposits in the world are known, it is, of course, a simple matter to distinguish between the real article, *viz.*, natural bitumen—and those produced artificially from the distillation of oil. It is possible to recognise—partly by analysis—any of these natural bitumens, and even if the situation of the deposit is not disclosed it is not difficult to ascertain if any particular bitumen is natural or artificial.

We venture to suggest that a list of countries where native and natural bitumen and asphalt occur in commercial quantities should be published for the guidance of those who are not acquainted with them, and if the analysis together with other distinguishing characteristics are also given with each we feel sure that this would largely assist in putting a stop to the loose way in which both the words "bitumen" and "asphalt" are being used.

It may also be as well to bear in mind that the terms "bituminous" and "asphaltic" do not denote origin or necessarily mean that materials so classified contain any portion of either bitumen or asphalt.—Yours, &c.,

THE DUSSEK BITUMEN COMPANY.

Canal Bank,
Deptford,
London, S.E.

August 26, 1912.

Street Corner Mirror at Beckenham.—A mirror about 3 ft. high, which shows the approaching traffic, has been placed on a signpost erected at the junction of four roads at Beckenham, Kent.

RESURFACING A CARRIAGEWAY ON THE "CHADWICK" SYSTEM OF BITUMINOUS-BOUND MACADAM.

By C. T. CHADWICK,
Assistant Borough Surveyor, Maidenhead.

The following is a description of the method employed by the author in resurfacing over 5,000 sq. yds. of carriageway on main roads in a borough in the South of England.

It may be mentioned that 4,000 sq. yds. of this has been done on the main street to the station, with a minimum width of 17 ft. Nearly all the traffic from the goods and passenger stations passes over this road, including traction engines, motor and steam lorries, and so forth. There are at times as many as 1,000 horse and petrol driven vehicles per hour over one portion of the road.

The road to be recoated is first of all scarified to a depth of 5 in. or 6 in. below the finished contour of the road. In no case must any part of the old surface be left unscarified. The surface is then shaped to the required contour (to allow for a 3-in. finished coat of stone), all the larger stone being raked towards the centre of the road to fill up where necessary. Having shaped the surface, it is watered with the water cart to the extent of 1 gallon to 1 sq. yd. of surface.

Having obtained a rough surface, but on a solid foundation, the surface is to be coated with about 5 in. to 6 in. (unrolled) of 2-in. granite. The stone is then watered sufficiently to wash all dirt and dust off the stone, and rolled immediately. It is well consolidated, so that it is impossible to see a crease after the roller has passed over it. The stone must be watered again when rolled, so that the top stone is left quite clean.

The stone should be left to dry and become warm by the heat of the sun before the binder is applied. Should the weather not be favourable for drying the stone, one of the road-drying machines now on the market should be used for this purpose.

The stone when thoroughly dry is then grouted with Tarvia "A" (grout grade), by means of a tar-spraying machine (Llewellin & James' machine was used by the author with success) to the extent of about 1 gallon to 2½ sq. yds. The surface is then evenly covered with ¾-in. granite chippings (cubical as possible). Having rolled it all over once, the surface is brushed lightly over, filling up the interstices as much as possible. It is rolled over once more, and all loose chippings swept off into the channel. The surface is then sprayed over again with Tarvia "A" and "B," in equal proportions, to the extent of 1 gallon to 4 sq. yds. This is then covered with ¾-in. cubical granite chippings. The chippings are then swept evenly over the surface, and the whole rolled again about three times over.

It is as well to run the roller over the finished work once or twice the next day in the early morning.

If the road is recoated early in the year it is advisable in the summer to tar paint the surface to the extent of 1 gallon to 7 sq. yds., in order to render it absolutely waterproof. Instead of using the ¾-in. chippings after the second grouting, the author has found that fine asphalt spread thinly over the surface, well brushed into the interstices, rolled, and then sprinkled with ¼-in. chippings, will render the surface of the road absolutely waterproof. By doing this, it saves the painting of the surface of the road later in the year, which is necessary when using chippings after the second grouting.

The advantages of this method of recoating the road over the water-bound method are claimed by the author to be as follows: (1) Practically noiseless; (2) dustless, consequently a great saving in watering and scavenging; (3) waterproof. In addition, this road possesses the following advantages over the asphalt macadam or tar-macadam roads; (1) Good foothold for horses in any weather; (2) does not present as slippery a surface in winter; (3) the macadam being granite, the road will wear better than asphalt-macadam roads, in which the aggregate is either limestone or slag, as one can rely more upon the evenness of quality of granite as compared with either of those materials. Another advantage of this method is that as good a wearing and waterproof surface is obtained as by the "Gladwell" method, without the use of the tarviated chippings as a matrix for the bed of macadam, and therefore with a corresponding saving in this respect. The cost of the road recoated in Maidenhead worked out at aproximately 6d. per sq. yd. extra above the cost of water-bound macadam.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, assoc.m.inst.c.e.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. Wm. Duff, of Dudley, to whom the premium for July was awarded, has selected the following books:—

"Public Health Law," by Sydney G. Turner (St. Bride's Press).

"The Drainage of Town and Country Houses," by G. A. T. Middleton (B. T. Batsford).

"Structural Iron and Steel," by W. Noble Twelvetrees (Whittaker).

These have been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

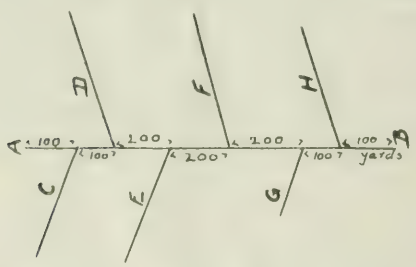
267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

269. Masonry Arch.—Draw the line of least resistance in a stone segmental arch of 10 ft. span with a rise of 2 ft. 6 in., the voussoirs having an equal thickness of 12 in. and each being equally loaded. (A.M.I.C.E.)

270. Traverse Surveying.—Shortly describe and explain the method of plotting a traverse survey by the method of co-ordinates. ("Surveyor.")

271. Bending Moments.—If a straight prismatic baulk of timber floats in a horizontal position with a weight of 4 cwt. hung to each end, what will be the bending moment at the centre of its length?

272. Surface-Water Drainage.—State, showing the method of working out, the sizes of pipes necessary to take the surface water from streets as per sketch.



Streets are 36 ft. wide, and tar paved; all the houses are drained on the combined system, so that no surface water from the forecourts, &c., need be reckoned. Rainfall ¼ in. per hour.

Street.	Length.	Fall.
A–B	1,000 yds.	1 in 40
C	200 ,,	1 in 20
D	300 ,,	1 in 10
E	200 ,,	1 in 20
F	500 ,,	1 in 30
G	100 ,,	1 in 15
H	150 ,,	1 in 50

(F. H. S., *Sheringham.*)

REPLIES TO QUESTIONS.

266. Surveying.—Describe in detail the operation of measuring a horizontal angle with a theodolite. ("Surveyor.")

It is assumed that the general construction of a theodolite is familiar, but a sketch of an instrument is given in Fig. 1 for the purpose of convenience of reference.

Let it be supposed that lines XY and XZ in Fig. 2 are part of a survey, and it is required to determine the magnitude of the angle θ formed by them.

If the survey is important, pegs should be driven in at the points X, Y and Z; these pegs should be of wood, with a nail in the centre for field work, or iron pins for good work. The theodolite is set up at point X, and ranging rods are held perfectly upright at Y and Z in turn, either on the nails or on the centres of the pins.

The instrument must now be "planted" over point X, so that the plumb bob A, suspended from the tripod, hangs directly over the nail in the peg or the centre of the iron pin, as the case may be. Having "planted" the instrument, and before levelling it up, clamp the upper or vernier plate D to the lower plate C, by means of the clamping screw G, with the arrow on the vernier exactly against zero of the "primary" scale on the lower plate. It is advisable at this stage to adjust the eye piece of the telescope so that the cross wires in the diaphragm are quite distinct, and so that there is no "parallax." The instrument is now levelled up by means of the levelling screws BBB and the spirit level K.

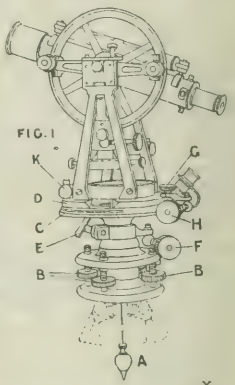


FIG. 1

Now focus the telescope upon the ranging rod at Y, which should be brought as nearly as possible into the centre of vision. Clamp the lower plate by tightening screw E, and by means of the tangent screw F adjust the line of sight so that the *bottom point* of the ranging rod corresponds exactly with the point of crossing of the wires of the diaphragm. Now release the upper plate by loosening screw G, and turn and focus the telescope upon the ranging rod, which has been removed to point Z. Clamp the upper plate to the lower plate, and adjust in the same way as was done before, so that the intersection of the cross wires exactly cuts the bottom point of the ranging rod at Z.

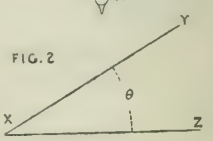

FIG. 2

The angle through which the instrument has been moved will be indicated on the primary scale by the arrow on the vernier. The number of degrees and subdivisions of degrees are now read off on the lower plate, and the number of minutes and subdivisions on the vernier, the total reading being the magnitude of the angle θ required. (I. W. S., *Clapham Junction.*)

The first step is to fix up the tripod and instrument exactly over the point at which the angle is made. This is usually done by hanging on a hook under the tripod head a cord with a plumb bob, and the tripod must be so arranged that this plumb bob hangs immediately over the station point.

The second step is to level the instrument; this is done in exactly the same way as with the level.

The third step is to clamp the horizontal vernier plate to its circle, so that the arrow mark on the vernier is exactly opposite the 360 deg. mark on the circle. Then turn the telescope, carrying with it the horizontal circle, which must be free on the spindle, so that the cross wires are exactly on a rod on one of the two lines at which the angle is made.

The fourth step is to clamp the horizontal circle to the spindle and release the vernier plate, and rotate the telescope (from left to right) until the cross wires are exactly on a point in the second line. (To get this fine adjustment the vernier plate should be gently clamped when nearly in position, and the cross wires brought on to the point by applying the slow motion.)

The fifth and last step is to read the angle. This latter is the arc described by the vernier arrow mark, which was at first 360 deg., in moving to the position which it has when the telescope is on the second line.

Note.—If the telescope has been turned from left to right, the figures on the horizontal circle opposite the arrow mark indicate the actual angle. If the telescope has been turned in the reverse direction this reading must be subtracted from 360 deg. —(W. D., *Dudley.*)

268. Text-books.—In what text-books can information be found in regard to (1) Theory of earth pressure suitable for reinforced concrete design; (2) Theory of elastic bridges; (3) Methods of taking float observations to ascertain the probable effect of tides on sewage discharged at different positions along shore? (R. W. T., *Gosport.*)

The theory of earth pressure suitable for reinforced concrete design is dealt with in "Handbuch für Eisen Bentonban," and in a paper by Mr. Meem in the "Proceedings" of the American Society of Civil Engineers, November, 1907. Vol. xxxiii.

The theory of elastic bridges is dealt with in "Design and Construction of Metallic Bridges," by Burr and Fack.

The method of taking float levels is described in "The Brighton Intercepting and Outfall Sewers," by J. G. Gamble ("Proceedings" of the Institution of Civil Engineers, vol. xliii.), and "Main Drainage of Torquay," by G. Chatterton ("Proceedings" of the Institution of Civil Engineers, vol. lxi.).

All these books and papers may be seen in the Patent Office library, Chancery-lane. (S. T., *Shepherd's Bush.*)

MUNICIPAL ENGINEERING IN SOUTH AFRICA.

JOHANNESBURG TOWN ENGINEER'S REPORT.

The municipal area of Johannesburg is, Mr. G. S. Burt Andrews, M.Inst.C.E., M.I.Mech.E., the town engineer, states in his report for the twelve months ended June 30, 1911, 20,530¼ acres in extent, there being altogether 106 townships, in which are 671¼ miles of streets and roads. The area controlled by the town council covers 81¼ square miles.

ROADS.

During the year nearly 17 miles of roads were constructed, being an increase of 4 miles on the previous year. Some 25½ miles of roadway were remetalled, 153,779 sq. yds. formed, and 620,990 yds. of roadway tarred.

Concrete kerbing and guttering in the central area of the town has been vigorously proceeded with, some 25,907 lin. yds. being laid. At the commencement of the year a scheme was submitted to the Works Committee for kerbing and guttering the streets in which underground storm-water drains have been laid outside the central area of the town. In this area there are nearly 36 miles of streets, in which approximately 9,600 yds. of kerbing and guttering are already laid. The approximate cost of the work was £100,500, which provided for the taking up and relaying the existing kerb and gutter. This scheme had unfortunately to be held over owing to the want of funds. The necessity for providing kerb and gutter in all streets where underground drains have been laid, in order to make the latter operative, has been pointed out on several occasions.

Mr. Andrews remarks that the continual increase in the building of more substantial business premises away from those thoroughfares in which the principal trade of the town was carried out in former years, in order to meet the demands of the ever-increasing population of this town, and the consequent increase in vehicular traffic, will sooner or later make it incumbent for the council to embark on a scheme for the creating of a more substantial class of roadway within the central area of the town, both from an economical point of view and for the comfort of the public. To be impressed with this fact, he says, one has only to take a cursory glance at the traffic (traction engines, motor cars, trollies, and so forth—on business days, closely examine the principal streets, especially at corners, and note the wear and tear the scrubbing action of the heavier class of fast motor cars being very perceptible on the class of material at present used by the department in the construction and maintenance of road work. Another item which Mr. Andrews considers the council will have to deal with in the near future is the absolute prohibition of heavy steam-traction traffic on the principal roadways. Strong attempts have been made to minimise this, but, unfortunately, with little good results. It is considered that this is a most undesirable means of locomotion within the principal area. The roadways are badly affected and when trailers are heavily loaded in wet weather, or when roads have been watered, incalculable harm is done to the streets, especially when chains are used under the wheels. There is also the nuisance caused by the smoke and noise, while not infrequently the coal boxes are opened, and the roadways strewn with ashes and coal.

SEWERAGE.

The most important drainage works carried out during the year was in the south-eastern urban drainage area. This was commenced during the latter portion of the previous year. The total area of the scheme is approximately 315 acres, of which about 187 acres have been sewered during the year under review. In addition to the mains, street connections were laid up to the stand boundaries of 790 private properties.

BUILDING OPERATIONS.

The acceleration in building operations which was reported in the previous year has been maintained, and there has been a steady increase in the number of buildings erected. Figures in the report show that the record of buildings is the highest since 1905, which can be regarded as the height of the boom in building. The most gratifying feature about this is the good class of dwelling which is being erected, a factor which tends to show that Johannesburg is becoming more and more the home of the people who have to work in it. There are fewer wood and iron buildings and more of those of substantial construction. From 1910-11 the value of new property approved was £1,438,895, the number of plans 3,297, and the number of buildings 7,422.

Although the building trade has been so vigorous for the past two years there is still no evidence to show that the town is being overbuilt. Many of the old and now dilapidated structures are being removed to make way for better buildings, and in addition the extension of the tramways to more distant suburbs has caused a considerable outward movement of population.

HOUSE DRAINAGE.

The council's scheme for assisting property owners to connect their premises with the sewers has been continued. A commission of 5 per cent is charged to the owners for executing the necessary work, and during the year a sum of £310 was earned in this way. The amount expended on contracts for the same period is £6,066. The total amount earned since the inauguration of the financial assistance scheme is £892. The total amount expended for same period is £15,442.

WATER SUPPLY.

During the year under review 848,445,600 gallons of water were purchased from the Rand Water Board; 706,957,600 gallons were supplied to customers connected with the council's mains. The quantity unaccounted for amounted to 141,921,945 gallons, or 16·68 per cent against 18·67 per cent in the previous year. From these figures it will be seen that the percentage of wastage has been appreciably reduced.

A comparative statement giving the monthly wastage for the past three years is submitted with the report, together with the progressive average for each year, and for the whole period from January, 1908, to date. This statement shows that there has been a gradual decrease in the progressive average from 20·26 per cent to 18·19 per cent for the whole period; but, if taken from the time waste-water meters were installed, say, from the end of the financial year ending June, 1910, it is seen that a marked improvement has been made. At the end of the period named the wastage was 18·70 per cent. During the first three months of the financial year ending June, 1911, the average dropped to 18·46 per cent, the next three months to 17·21 per cent, and the third three months, ending March last, to 16·01 per cent. Hitherto the allowance made for wastage has been 20 per cent, which has been reduced in the estimates for the current year to 18 per cent. A difference of 2 per cent on the present quantity paid for means 17,000,000 gallons per annum, which costs £531.

A thorough system of inspection at night has been carried out during the year in many of the districts where the meters registered a large overflow during the night. A good deal of preparation is required before any particular district can be tested, and when this has been completed the tests will be undertaken much more frequently. As an instance of the usefulness of these meters, it might be mentioned that a long length of 9-in. main was found to be leaking badly, which might not have been discovered for some time but for the waste-water meters.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bath T.C. (August 15th. Mr. F. H. Tulloch).—£400 for the provision of a public sanitary convenience at the junction of Snow-hill with Myrtle-place, Walcot.—It was stated that many complaints had been made regarding the existing structure. The difficulty had been with regard to a site, but recently a suitable one had been purchased, and on this it was proposed to erect the new structure. The site was paid for out of the rates.

Birkenhead T.C. (August 21st. Mr. Edgar Dudley).—£990 for street improvements.—The money will be apportioned by the corporation as follows: For the purpose of a cottage in Well-lane and widening the thoroughfare, £159; for the purchase of a strip of land and works in Balls-road, £184; acquisition of a strip of land at the junction of Bedford-road and New Chester-road, £647. There was no opposition to the application.

Coventry T.C. (August 15th. Mr. R. G. Hetherington).—£67,000 for municipal buildings; £12,000 for surface-water drainage in Earlsdon and Chapel Fields districts; £1,477 for redemption of tithe and land tax on the sewage farm; and £280 for street improvements in Radford-road and Silver-street.—With respect to the loan for municipal buildings, the town clerk, Mr. G. Sutton, stated that the assessor, Mr. Guy Dawber, advised the council of the designs which he placed first, second and third. The figure of cost aimed at by the council was £50,000. The assessor was of opinion that a building according to the design placed first could be built for that sum, and that was one of the conditions upon which competition was invited. Owing to some extent to the alterations which had been made in the plan subsequently at the request of the council, and to the increase in the cost of labour and materials recently, the lowest tender was £60,375. Twenty-two tenders were received, and the tendering was in every way successful, because the figures were so close. They ranged from £60,000 to £63,000 or £64,000, with one or two exceptions. The council considered the lowest tender and the firm tendering (Messrs. Wilcox & Co., Wolverhampton) were satisfactory, and had provisionally entered into a contract, subject to the sanction to the loan being obtained. The surface-water drainage loan, the town clerk stated, was necessary for the prevention of floods. The other applications were more or less of a formal character.

Croydon R.D.C. (August 14th. Mr. W. O. E. Meade-King).—£4,443 for works of wood paving in High-street, Collier's Wood, and London-road, Mitcham.—The clerk, Mr. Gowen, gave particulars as to the proposed improvements. The works in London-road, Mitcham, were to cost £1,878, and those in High-street, Collier's Wood, £2,565. Both were main county roads, but the best terms which could be obtained from the county council were that the latter should pay two-thirds of the annual repayment of the principal and interest if the loan were sanctioned. Two lengths in both these roads had already been treated, the Local Government Board sanctioning the loan in 1911. The surveyor, Mr. R. Chart, said the council would like the loan as soon as possible, so that the work could be carried out before the winter months.

Doncaster R.D.C. (August 27th. Mr. A. G. Drury).—£12,225 for works of sewerage and sewage disposal at the new colliery village of Bentley.—Mr. Pye, clerk to the council, explained that the scheme, rendered necessary by the large building developments, was to provide main sewers and sewage disposal works for 198 houses already built, and for 764 houses proposed to be built, in the neighbourhood of the Old Toll Bar, where six estates are being laid out for new streets and buildings. The plans and particulars for the work had been designed by Messrs. D. Balfour & Co., civil engineers, Newcastle-on-Tyne. Mr. Balfour, who explained the scheme, said the proposed new works would be 385 yds. from the colliery houses, and 170 yds. from the Bentley Common-lane.

Kingstown U.D.C. (August 19th. Mr. P. C. Cowan).—£2,300 for the macadamising of certain roads.—Mr. Gerald Byrne, legal adviser to the council, stated that the loan was in respect of tar-macadamising the roads on the sea front from Longford-terrace, Marketown up to the People's Park, Sandycove. Kingstown was now a great resort for holiday-makers, and they had many complaints as to the dust nuisance. They had tried tar-spraying, but it had not been entirely successful. Mr. J. Berry, surveyor, gave evidence as to the proposed work.

Stockport T.C. (August 27th. Mr. Courtenay Clifton).—£3,371 for street improvements, and £800 for the provision of filtering, aërating and heating plant at the St. Petersgate Baths.—The town clerk, Mr. R. Hyde, stated that Dealstone-lane had become a main thoroughfare from Stockport to Marple, and it was proposed to widen portions of the road to an average width of 60 ft., the estimated cost being £1,796. It was also proposed to acquire land to widen Lower Hillgate, one of the oldest streets in the borough. The traffic down Hillgate was very heavy. It was also intended to widen Hardman-street from 25 ft. to 38 ft. The Road Board had not made any grants to the borough. The town clerk proceeded to explain that the water in the swimming baths was now changed twice a week in the summer and twice every three weeks in winter. By the new system of filtering there would be fresh water in the baths all the year round, and a considerable saving of water. The baths were used by 100,000 bathers in the course of the year.

APPLICATIONS FOR LOANS.

Brampton R.D.C.—£720 for a water supply at Talkin.

Darwen T.C.—£18,000 for a drainage scheme.

Easingwold R.D.C.—£8,657 for a water supply scheme.

Okehampton T.C.—£360, excess expenditure in connection with the new sewage scheme.

Rawtenstall T.C.—£8,700 for the provision of thirty-seven houses.

St. Helens (Isle of Wight) U.D.C.—£290 for tar-macadam surfacing.

Settle R.D.C.—£1,100 for a sewage disposal scheme for Airton.

Southend T.C.—£6,033 for making up certain streets.

Sunderland T.C.—£624 for school extension.

Ystradgynlais R.D.C.—£1,785 for the construction of two bridges.

LOANS SANCTIONED.

Bray U.D.C.—£10,000 for workmen's dwellings.

Brighouse T.C.—£5,000 for erecting public baths.

Camborne U.D.C.—£24,750 for the North Cliff sewage disposal scheme.

Okehampton T.C.—£800 for the purchase of land for a new town hall site.

Paignton U.D.C.—£397 for the purchase of land for a refuse tip.

Penrith T.C.—£2,000 for the purchase of the castle ruins and surrounding land.

Spilsby R.D.C.—£694 for sewage disposal works.

Thornaby T.C.—£4,300 for a municipal depot.

Wednesfield U.D.C.—£400 for rebuilding Pinfold Bridge.

Scottish Surveyor's Death.—Mr. John Stevenson, burgh surveyor of Johnstone, near Paisley, was killed early on Tuesday morning as the result of a fall from a London and North-Western express at Shilton, a few miles from Nuneaton. Mr. Stevenson and his wife were members of a party who had been spending their holiday in Germany. At midnight on Monday they left Euston on their return to Scotland. Near Shilton one of the ladies complained of a draught. Mr. Stevenson was closing the carriage window when the door flew open and he fell on the line. The wheels of the train passed over his legs.

"The Cate of Ireland."—This is the appropriate title given to the Kingstown Urban District Council's latest official publication, a booklet of 100 or more pages, which Messrs. Odhams, Limited, of Long-acre and Covent Garden, London, W.C., have printed for the local authority. The beauties of Kingstown are familiar to numberless travellers, but to the British holiday-maker its advantages as a health resort are, generally speaking, little known, and the admirably produced booklet we refer to, which has been compiled by Mr. John R. Eyre, and which has been placed on sale at the price of 3d., should do much to add to its popularity on this side of the water.

National Fire Brigades Union.—Ex-King Manoel of Portugal reviewed 600 firemen from all parts of the country at the Crystal Palace on Saturday in connection with the National Fire Brigades Union twenty-fifth annual camp which had been held there during the week. King Manoel presented the challenge shields, cups, bowls, and other prizes won during the week by the successful competitors. Among the winners of the principal trophies were the following brigades: Bampton, Bedford, Windsor, Southend, St. Albans, Sittingbourne, Leyton, Essex County Asylum, Harpenden, Torquay, Bournemouth, Metropolitan Water Board, Gillingham, and Peterborough. His Majesty afterwards witnessed a drive past of the horse and motor fire engines and other appliances, and christened a new Dennis-Gwyne turbine fire engine which has just been purchased by the Malvern Fire Brigade, and a duplicate of which is being specially made for Oporto.

KENT MAIN ROADS.

COUNTY SURVEYOR'S REPORT.

Mr. H. P. Maybury, M.INST.C.E., the county surveyor, in the course of his eighth report upon the maintenance and repair of the rural main roads of Kent, together with those main roads situate in non-retaining urban areas (Bexley, Chislehurst, Cheriton, Dover, Footscray, Whitstable and Wrotham), states that the actual cost of maintenance, tar-painting and improvement work carried on during the year ended March 31st last was £112,361, being £18,117 more than in the preceding year. Of this amount £36,205 was expended upon tar-painting, widenings, kerbing, channelling, paving and drainage works, representing £60·6 per mile. The cost of maintenance proper, therefore, was £127·6 per mile, being £14·8 per mile more than in the previous year.

The tar-painting bill alone came to £28,665, 1,146,634 gallons of tar having been used. The area treated was nearly 6,000,000 super. yds., the payment for tar alone representing £12,583. In addition, some 400 tons of pitch and bitumen were used, at a cost of about £900. In the urban retaining districts the county council actually paid to the several authorities £5,103 for tar-painting about 125 miles of road, representing 1,530,094 super. yds. Tar-painting, therefore, carried out in the county in the year under review represented no less a sum than £33,768.

The total quantity of material used upon the 596¾ miles of directly maintained roads was 131,667 tons or yards, being 14,641 tons or yards more than was required in the preceding year, and representing 220 tons or yards per mile of maintained road. This is the largest quantity which has been used upon the county roads in any one year. Of the total quantity, 47,849 tons was granite and 30,225 tons Kentish rag tarred-macadam, this latter being an increase of 17,696 tons over that used in the preceding year. The maximum number of men employed was 520, while the minimum was 400. The amount paid in wages was £29,232.

Notwithstanding the great increase in motor car and traction traffic during the year, the county surveyor is able to report that the roads have been maintained satisfactorily and are much stronger than they ever were before.

In order to meet the requirements of the Road Board a periodical census of traffic using the several main roads in the county has been taken. It is found in some instances that self-propelled vehicles represent no less than 75 per cent of the total recorded. "This great change still further necessitates the departure from old systems of construction and maintenance, and compels the extended use of natural and artificial bitumens and tars. As an object-lesson of wear, a water-bound surface, which formerly had at least a three years' life, is now completely destroyed in six months, as was exemplified upon one of the experimental lengths laid at Sidcup, which, completed in June of 1911, had to be reconstructed in January of the present year."

The whole of the urban roads, Mr. Maybury states, have been maintained in a satisfactory condition and at a cost comparable with that of preceding years.

As distinguished from works of maintenance, permanent improvements were carried out during the year at a total cost of £7,539.

Rats in a Town Hall.—The *Daily Telegraph* New York correspondent tells an amusing story of a certain municipal official who casually remarked a few days ago to a newspaper man that he wanted a good rat-trap with which to rid the town hall of its rodents. To-day, says the story, this official has a room filled with rat-traps of every description, sent from every part of the United States. The rat-traps, it is said, embrace every form of killing known to humanity. They kill by electricity, by guillotining, by drowning, by sneezing, and by suicide. The scheme of a genius, who declares that he can force the rats to take their own lives, is to sprinkle lye on the outside of the rat holes. The rats get the lye on their feet, and it will burn so much, he claims, that they will be glad to lick it off, and thereby poison themselves. Another trap, it is asserted by the inventor, catches the rat in a vice-like grip, and automatically flings the animal with terrific force against a wall 15 ft. away. The city official says he is sorry he mentioned rat-traps now, as he has so much embarrassment of choice that he cannot decide.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Brighouse £5,000, Daventry £2,000; housing and town planning—Doncaster £29,000; roads and materials—Bognor £6,000, Llandudno, Stirling £15,000; sewerage and sewage disposal—Coventry £35,880, Goole £21,500, Halifax £24,000, Loughborough; water gas and electricity—Aberdeen £25,385, Easingwold £8,657, Newport (Mon.).—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Whitby U.D.C.—The council having inquired whether persons employed casually by the council in digging for sewers and hacking roads are required to be insured under Part 1 of the National Insurance Act, the Insurance Commissioners have decided that such persons are employed within the meaning of the Act, as, although their employment is casual, it is for the purposes of the business of the employing authority.

BUILDINGS.

Brighouse T.C. It was decided on Wednesday to commence at once the erection of public baths, sanction to the borrowing of £5,000 for which was lately received.

Cornwall C.C.—The new county council offices at Truro were formally opened last week.

Daventry U.D.C.—A proposal is being considered for the joint management of the isolation hospital with the town council. A sum of £2,000 is to be spent on new wards and offices.

Londonderry T.C.—It has been decided to purchase a site between Strand-road and the Quay for £3,740, for the purpose of a depot.

Newport (Mon.) T.C.—A sub-committee of the Parliamentary and Improvement Committee has been appointed to consider alternative schemes for an enlarged town hall—*viz.*, an extension on the present site or the acquisition of a new site upon which the whole of the municipal offices and law courts can be erected.

Retford T.C.—As a result of the serious outbreak of typhoid fever at Retford, it has become necessary to build a new isolation hospital for the town. The inspector who has visited Retford on behalf of the Local Government Board, issued a report on Saturday, in which he urges that the houses not already connected with the deep drainage should be connected with as little delay as possible, and that all contaminating sewers running into the becks should be abolished.

HOUSING AND TOWN PLANNING.

Chesterfield T.C. The draft of the Chester-street area town planning scheme has been submitted to the Local Government Board for their observations, and the borough surveyor, Mr. Vincent Smith, has meanwhile been authorised to proceed with the construction of the road from Chester-street to Ashgate-road, including the bridge over the Holme brook.

Doncaster T.C.—In connection with the rehousing scheme to which the corporation committed themselves in the Act of Parliament empowering them to construct the North Bridge-road over the old Marshgate level crossing, a contract for the building of 124 new houses has been let to Mr. A. Thompson, Town Moor-avenue. The work is to be completed in nine months. The contracts are as follows: For sixty houses of three different types at Balby, £12,530; for sixty-four houses in Carr House-road, Doncaster, £13,467. In each case the frontage on the main road is being reserved for a better class of property, and the value of the land to be built upon under the rehousing scheme is put down at 2s. 6d. per yard. This works out for the Balby section at £1,633, and for the Carr House-road section at £1,549, bringing the cost of the two sections for the rehousing of 124 families up to over £29,000.

Ellesmere Port U.D.C. The Local Government Board have expressed willingness to allow the council to prepare a town plan of an area, including the districts taken in at the last extension.

Newry No. 1 R.D.C.—It has been decided to advertise again for the building of twenty cottages, as only one tender had been received for one house in reply to advertisements already issued.

Steyning West R.D.C.—It has been decided to oppose the Shoreham Urban District Council's town planning scheme so far as it affects Lancing.

Wednesfield U.D.C.—A letter has been received from the Local Government Board calling attention to the unsatisfactory housing conditions at Wednesfield as disclosed by the report of the county medical officer of health, and asking what the council have been doing in the matter. Reports prepared by the medical officer of health and the surveyor, Mr. E. Rogers, are to be forwarded by the clerk to the Local Government Board.

Winchester R.D.C.—The plans of the housing scheme at Fair Oak have been approved.

PARKS AND OPEN SPACES.

Kirkley U.D.C. Portland Park, some 14 acres in extent, was formally opened to the public last week. The grounds have been leased to the council by the Duke of Portland for an annual rental of £5.

ROADS AND MATERIALS.

Aberdeen T.C.—The Streets and Roads Committee recommend the widening of Moberly-street at an estimated cost of £480.

Ayrshire C.C.—The estimated cost of the county roads for the ensuing year is £41,383, as compared with £38,768 last year.

Bognor U.D.C.—A scheme is under consideration for the widening of the Marine-drive and promenade, at an estimated cost of £6,000.

Bolton T.C.—A scheme for the improvement of Captains Clough-road, at an estimated cost of £2,716, is being considered.

Cosforth U.D.C.—Elmfield-road is to be improved, at an estimated cost of £2,230.

Heckmondwike U.D.C.—The tender of Mr. D. Brook, at £702, has been accepted for paving work in Bath-road.

Linlithgow T.C.—The burgh surveyor, at a recent meeting, submitted a report regarding the condition of the footpaths of the town, giving a list of some thirty properties where the pavements were defective and required relaying or improvement. It was agreed to call upon the proprietors to have the defects remedied.

Llandudno U.D.C.—A conference is to take place with the Conway Council as soon as possible with a view to considering the best means of improving the road communication between the towns of Llandudno and Conway. At the joint meeting two proposals will be considered—the widening of the existing road between Llanrhos and Tywyn, and the construction of a new direct road on the level, through Deganwy.

Northam U.D.C.—It has been agreed to contribute a fourth of the cost of making up certain roads at Westwood Ho! under the Private Streets Improvement Act. The roads in question provide the main access to the beach and front.

Petworth R.D.C.—Subject to its being placed in a proper state of repair, it has been decided to take over the road leading from Little Bognor to the main Fittleworth-road.

Stirling T.C.—A scheme has been adopted for the widening of St. Mary's-wynd, and the formation of a new street on the east side of the thoroughfare, at a cost, including the demolition of property, of £15,000.

Swanage U.D.C.—A letter has been received from the clerk of the county council, forwarding the report of the County Works Committee adopted by them to the effect that the Valley-road between Town's-end and Leeson, for a length of over 3 miles, should be taken over as a main road in exchange for an equal length of the higher road to be dismained, the road to be made of a uniform width of 18 ft. throughout and surfaced with granite, towards the cost of which

the county council were prepared to contribute £1,000.

Weobley (Hereford) R.D.C.—An additional grant of £200 has been made for road repairs.

SEWERAGE AND SEWAGE DISPOSAL.

Buckingham R.D.C.—The sanitary surveyor, Mr. L. Bell, has received instructions to prepare a sewage disposal scheme for Tingewick.

Coventry T.C.—The council have agreed to the recommendation from the Sewage Farm Committee that an extension scheme at the sewage farm should be carried out at a cost of £35,880. Mr. Bausor, chairman of the Sewage Farm Committee, explained that the scheme was one of bacterial treatment, which was a new departure for Coventry. The committee had experimented with bacteria beds for the past two years, and the results had been most satisfactory. The committee recognised that the further acquisition of land could not go on indefinitely. The bacteria beds would enable them to deal with 2,000,000 gallons of sewage a day, and would meet the needs of the city for some considerable time. It was proposed to spend £19,000 upon bacteria beds, and the remainder as became necessary.

East Ashford R.D.C.—The tender of Messrs. Hardy & Co., of Woking, at £2,347, has been accepted for the Oxenturn-lane drainage scheme.

Coole U.D.C.—Tenders have been accepted for the new sewerage scheme. The engineer's estimate was £22,500, but the two tenders accepted amounted to £1,000 less.

Halifax T.C.—The Highways Committee have accepted the tenders of Messrs. Stanton & Co., at £14,000, and Messrs. Bowers Bros., at £10,000, for pipes and excavation work for the Stoney-road sewerage scheme.

Loughborough R.D.C.—Steps are being taken for the provision of a scheme for the drainage and disposal of the sewage of Hathern.

Romford R.D.C.—The tender of Mr. B. H. Hale, at £197, has been accepted for works of surface-water drainage.

Ruthin R.D.C.—A letter has been received from the Denbighshire County Council intimating that it was the intention of the Public Health Committee of the county to proceed with the construction of a water supply to the village of Llanarmon and a sewerage scheme, and charge the expense to the district council, unless a satisfactory scheme was taken in hand and carried out without delay. The rural committee have in consequence appointed a special committee to visit the district and report.

Upton R.D.C.—The tender of Messrs. Law, of Kidderminster, at £4,088, has been accepted for carrying out a sewerage and sewage disposal scheme for Kempsey.

WATER, GAS, AND ELECTRICITY.

Aberdeen T.C.—The water reservoirs at Mannofield and Cattofield are to be covered at an estimated cost of £25,385.

Alnwick U.D.C.—An augmented supply of water for the town is to be obtained from Brizlee Springs, at a cost of £4,698.

Dudley T.C.—A committee that has been inquiring into the position of the electricity undertaking advises the council to sell the concern.

Easingwold R.D.C.—A new water supply scheme for the parishes of Coxwold, Crayke, Easingwold, Oulston, Stillington, Thornton Hill and Newburgh, is to be carried out at an estimated cost of £8,657.

Lossiemouth T.C.—It has been agreed to adopt electric lighting for the burgh, and Mr. J. Alexander Bell, of Aberdeen, has been appointed engineer and instructed to prepare plans and specifications.

Newport (Mon.) T.C.—Mr. Baldwin Latham has received instructions to prepare a scheme for a new reservoir at Pant-yr-eos.

Norton (Yorks) U.D.C.—Tenders have been accepted from the Malton Gas Company for supplying gas for pumping power at the town's waterworks, and for the lighting of the public streets, the first at £120 per annum for three years, and the second at £130 per annum for the same term.

Portland U.D.C.—Experiments which are being carried out in the Portesham Valley, where the council are about to construct waterworks, at a cost of several thousand pounds, have proved eminently satisfactory thus far. The machinery and pumps that have been installed at Portesham are only temporary, and they are not capable of dealing with the amount of water available in the borehole. The permanent plans will deal with 600,000 gallons a day.

MISCELLANEOUS.

Aberavon T.C.—A recommendation has been made by a committee for the purchase of a Morris fire engine.

Bradford T.C.—The Health Committee have decided to discontinue the use of horse-drawn disinfecting vans, and have arranged to purchase from the Tramways Committee two motor vans, and to provide new bodies for them, the corporation also buying a motor parcels van.

Stockport T.C.—The corporation have adopted the "Lloyd-Köhler" system of railless traction, which is in service at Bremen, Ludwigsberg, and elsewhere on the Continent, but is not otherwise installed in this country.

Wednesfield U.D.C.—The tender of Messrs. Marshall, Sons & Co., Limited, at £608, has been accepted for the supply of a traction engine with convertible parts to make a 9½-ton roller and wagon.

Ilkeston's New Sewage Disposal Works.—The mayor (Councillor Samuel Shaw) will on Wednesday, the 11th prox., at 3.30 p.m., perform the opening ceremony in connection with the new sewage disposal works which have been constructed at Ilkeston.

York Corporation and the Gasworks.—At a special meeting of the proprietors of the York Gas Company on Monday it was resolved to approve of the provisional agreement for the sale of the undertaking to the York Corporation, as embodied in the company's new Act of Parliament.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CORPORATION OF MADRAS, INDIA.

CONTRACT M & M No. 16.

PIPES, SPECIAL CASTINGS, SLUICE VALVES, AIR VALVES, &c.

The Corporation of Madras invite Tenders for about 9,500 tons of Cast-iron Pipes and Special Castings, together with Valves and other Works required in connection with the Water Supply Distribution system prepared by J. W. Madeley, Esq., M.A., M.INST.C.E., M.AM.SOC.C.E., &c., Special Engineer to the Corporation. All the works to be delivered in good order and condition to the Corporation Stores or other appointed places within the Municipal limits of the City of Madras in India.

Contract Forms, with Drawings bound with them, can be obtained from the undersigned upon payment of £10, which will be refunded upon receipt of a *bonâ-fide* Tender, accompanied by all the documents.

JAS. MANSERGH & SONS,
Agents to the Corporation.

5 Victoria-street,
Westminster, S.W.
August 28, 1912.

SURVEYING ASSISTANT.—Wanted, in a Borough Surveyor's Office in the Manchester District, a Surveying Assistant, well experienced in private street work, quick and accurate, and good draughtsman; commencing salary Two Guineas per week.—Applications, stating age, particulars of training and experience, and accompanied by copies of not more than three recent testimonials, to be delivered to Box 1,182, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C., on or before Saturday, the 31st August.

ASSISTANT (22), three years Articles and Assistant in large Rural District, desires appointment as Assistant to Municipal Engineer; surveyor, leveller, neat draughtsman; sewage disposal, water supply, private streets, buildings, roads, good municipal experience, &c.; highest references.—"Desideratum," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

PERSONAL.

Mr. J. Retallack, one of the road surveyors of the Truro Rural District Council, has resigned.

Mr. J. Cornall, surveyor to the Rishton Urban District Council, has had his salary increased by £20 a year.

Mr. H. J. Morgan, surveyor to the Loughborough Rural District Council, is, we regret to state, suffering from congestion of the lungs.

Mr. A. J. Blight and Mr. Carbis, surveyors to the St. Austell Rural District Council, have had their salaries increased by £20 a year.

Mr. F. C. Betts, surveyor to the Rothwell Urban Council, has resigned his post, having obtained an appointment under the Wantage Urban District Council.

Mr. Norman Smith, assistant surveyor to the Ilkley Urban District Council, has resigned his appointment with the intention of proceeding to one of the universities.

Mr. Robert Morham, who was for thirty-five years superintendent of works to the Corporation of Edinburgh, and who passed away recently, left property of the value of £10,769. Mr. Morham was seventy-three years of age.

Messrs. W. Hosken, assistant surveyor to the Hendon Rural District Council, and H. Criswell, assistant surveyor to the Chertsey Rural District Council, have been appointed district surveyors under Mr. H. W. Bowen, Assoc.M.Inst.C.E., county surveyor of West Sussex.

Louth County Council met recently for the purpose of making arrangements for the appointment of a county surveyor in succession to the late Mr. P. J. Lynam. A letter was read from the Local Government Board stating that the candidates would be required to submit to an examination by the Civil Service Commissioners. It was agreed to offer a salary of £275 per annum, and that pending the making of a permanent appointment the work of the county surveyor should be discharged by the assistant surveyors. A vote of sympathy was passed with the relatives of the late Mr. Lynam.

Mr. M. P. Blair, the city engineer of St. Boniface, Manitoba, is a native of Ireland, and was born in 1882. He left the Emerald Isle at the age of seven, and was educated at the Chicago public and high schools and elsewhere. His first professional experience was obtained with the Chicago, Milwaukee and St. Paul Railway, and after holding various other positions he was finally made assistant city engineer and then chief engineer of St. Boniface, and has held the latter office for the last four or five years. He is an associate member of the Canadian and American Societies of Civil Engineers, and a member of the American Waterworks Association, the National Geographical Society, and the Canadian Cement Association.

Mr. Harold Collins, deputy city engineer, of Norwich, was in charge of the engineer's department in the absence on holiday of his father, the city engineer, when the terrible floods overtook the city this week, and with the town clerk (Mr. A. H. Miller) and the works superintendent, was engaged throughout the crisis, almost without intermission, in every possible effort for the protection of life and property. One of the first steps taken when the waters appeared to be spreading was for the removal of the corporation staff, and to hold horses and carts ready for any emergency. The special correspondent of the *Daily News and Leader* freely acknowledged the services rendered by the municipal staff by stating that "those who were left in authority rose to the occasion splendidly and with great effect."

Mr. E. P. Richards, city engineer of Madras, has been appointed to the important position of chief engineer to the Calcutta Improvement Trust. There were over 400 candidates for the post, and selections were made in India and England. The salary during the first six years will be £1,600, after which it will be increased annually by £80 until £2,000 is reached, when fresh terms will be negotiated. In addition, an allowance of £80 a year will be made towards motor car upkeep, plus very generous provident fund and leave rules. The appointment has been confirmed by Lord Carmichael, Governor of Bengal. Mr. Richards has been city engineer of Madras for one year only, but in that time has produced a complete reorganisation scheme which has been approved by the corporation, and will shortly receive the sanction of the Government of Madras. He has in hand a new town hall, large isolation hospitals, new bridges, large improvement schemes, and road widenings and extensive housing schemes. Aided in a very able manner by his assistant engineer, Mr. J. E. Hensman, B.E., Assoc.M.Inst.C.E., and Mr. Srinivisa Chari, B.E., B.A., he has revolutionised the making of the Madras roads, of which there are 400 miles, and many miles of good macadam have been laid and considerable tar-spraying work undertaken by him, there being some 300 motor cars and 600 motor cycles in the city. He will commence his duties in Calcutta about the middle of next month. Some £6,000,000 has been earmarked for expenditure by the Trust, and the work projected is expected to last not less than fifteen years. Mr. Richards when in England was engaged for nearly seven years on the Derwent Valley waterworks, with Mr. Edward Sandeman, M.Inst.C.E., and has also served under Mr. A. Fidler, M.Inst.C.E., borough engineer of Northampton, Mr. S. S. Platt, M.Inst.C.E., borough engineer of Rochdale, and other well-known engineers, besides having acted as superintendent to Messrs. George Bell & Sons, Limited. He is a Fellow of the Geological Society, a member of the Institution of Civil Engineers, the Institution of Municipal and County Engineers, the Institution of Municipal Engineers, and of the Royal Sanitary Institute, and an associate member of the Institution of Water Engineers.

INTERCEPTING TRAPS IN HOUSE DRAINS.

DEPARTMENTAL COMMITTEE'S REPORT.

The report of the Departmental Committee appointed by the President of the Local Government Board to inquire and report as to the use of intercepting traps in house drains was issued on Wednesday. The committee, which consisted of Mr. L. W. D. Mair, Mr. A. A. G. Malet, M.Inst.C.E., and Mr. H. J. Pearson, A.R.I.B.A., with Mr. E. H. Terry as secretary, visited several towns in prosecution of their inquiry.

The committee find that the necessity of the intercepting trap on bacteriological or epidemiological grounds has not been established. It appears, in fact, that the characteristic of sewer air which is of practical importance is its smell, and that, therefore, the question as to the necessity or otherwise is narrowed down to the issue whether, in any given case, sewer air would be more perceptible to the sense of smell with or without the trap. Nevertheless, the question is one of serious public health importance. Where, however, the trap is considered to be necessary or desirable, the measures for providing against the effects of the blocking of the trap should not be neglected—namely, the closure of the open channels in the inspection chamber, giving access to the trap, and the construction with iron pipes of the main portion of the house drain, unless this is remote from the house. It is also desirable that the possibility of splashing should be taken into account in the construction of drains in order that it may be reduced to a minimum.

Sanatoria Exhibition.—An exhibition of appliances, fittings, materials and products relating to sanatoria, tuberculosis dispensaries, and the treatment of tuberculosis generally, was opened on Monday last at the offices of the Society of Medical Officers of Health, Upper Montague-street, London. The exhibition is based entirely on the recommendations of the Departmental Committee on Tuberculosis. One of the features of the collection is a revolving shelter, designed by a Norwich firm. The doors and windows of this structure are removable, and it may be turned round to enable the patient to get all the light possible and as a protection from adverse winds. Other shelters shown are adaptable for the treatment of a consumptive in his own garden at home. All these are built with a view to giving the maximum amount of air, even if protection from bad weather is necessary. Probably, however, the most interesting exhibit is a model of the Zurich system of house-to-house dust and refuse collection. Where the system is in vogue, and this embraces many towns in Switzerland, France, Germany Austria, and other European countries, the householder has to provide himself with a specially contrived dustbin, which is capable of having its contents put into a sanitary cart without the possibility of the refuse being sorted by the dustman in charge of the cart.

ALLEGED DAMAGE FROM TARRED ROADS.

COUNSEL'S OPINION TO THE AMERSHAM RURAL COUNCIL.

Counsel's opinion has been submitted to the Amersham Rural District Council from Mr. W. A. Casson with respect to a claim of Messrs. Beckley & Holliman, watercress growers, The Moor, Chesham, this firm having claimed in respect to alleged damage to their watercress beds through the draining of water from tarred roads. In the course of his statement Mr. Casson wrote:—

"The point in this case is quite a new one so far as the courts are concerned, for there has never been any litigation on the subject in the High Court. The practice of tar-spraying roads is quite a recent one, but it is now a well-established one, and the question arises whether a local authority can be held liable for any damage resulting from the particular kind of material used. It is quite clear that a local authority cannot be held liable for any results that follow the drainage of the surface water from a road by reason of its entering any watercourse if such surface water carries with it any material—*i.e.*, of a poisonous nature—which may have been dropped on the road by a private person. But the case is different where the local authority themselves place tar or any other deleterious substance on the road, as if they do so they must take all reasonable and proper precautions to prevent its causing injury to any stream of water. The owners of a stream may be bound to take the surface water from the roads, but the easement to which they are subject cannot be increased so as to compel them to take dirty water instead of clean water. It has been held in 'Cawkwell *v.* Russell' (1856) that where a man has a right to send clean water on another's land he may be prevented from sending any water at all as soon as he begins to send dirty water. Thus it is evident that the local authority can acquire no right to send tar-polluted water where they have previously sent ordinary surface water into a stream. In the case before me the Amersham Rural District Council clearly injured the watercress beds of Messrs. Beckley & Holliman, and I doubt if they would have a good defence on the merits to an action for damages resulting from this injury, and I am therefore of opinion that the council should compromise the claim on the best terms possible. I am not informed whether a writ has been issued against the council within the time limit fixed by the Public Authorities Protection Act, 1893, but in view of the case 'Hague *v.* Doncaster Rural District Council' (100 L.T. 121; 7 L.G.R. 129), in which it was held in somewhat similar circumstances that there was a continuous injury or damage, and that the time limit did not therefore apply, an action is still maintainable. I think that the council will be well within their legal rights in compromising the claim, and that any payment made in pursuance of an agreement to compromise would be a legal payment, and would not be liable to be surcharged."

It was agreed that the council should settle Messrs. Beckley & Holliman's claim.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

FORTHCOMING DISTRICT MEETINGS.

Eastern District meeting at Grays, September 21st or 28th.

East Midland District meeting at Ilkeston, September 28th.

Eastern District meeting at Gerrard's Cross, April 26th, 1913.

A meeting which had been arranged for September 13th and 14th at Wrexham has been postponed.

Thomas Cole,
Secretary.

11 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

ANNUAL MEETING.

The annual meeting will be held in London in October.

B. Wyand,
Secretary.

39 Victoria-street, S.W.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE, WEST HAM: PRELIMINARY NOTICE.

The annual conference of the Municipal Tramways Association (Incorporated) will be held in West Ham on September 25th, 26th and 27th next. De Keyser's Hotel, Victoria Embankment, E.C., has been selected as headquarters for delegates, and the following programme has been arranged:—

September 25th.

10.15 a.m.—Reception by the Mayor and West Ham Council.

10.30 a.m.—Presidential address by Mr. H. E. Blain, tramways manager, West Ham.
Paper: "Tramways Administration by Municipalities: A Retrospect and a Forecast," by Mr. Councillor S. C. T. Neumann, deputy-chairman Bradford Tramways Committee.

1 p.m.—Luncheon.

2 p.m.—Proceed to Tramways Depot, Greengate-street, Plaistow, by special cars.

2.15 p.m.—Discussion on the interim report of the Corrugation Committee.

3.30 p.m.—Inspection of depot and of the Exhibition of Tramway Appliances, &c.

7.30 p.m.—Corporation reception at the town hall.

September 26th.

10 a.m.—Paper: "Tramway Fares and their Basis," by Mr. W. J. McCombe, tramways manager, Hull.

12.15 p.m.—Luncheon.

1.15 p.m.—Proceed by special cars to tramway depot.

1.30 p.m.—Meeting of managers' section.

1.30 to 3 p.m.—Inspection of depot and Exhibition of Tramway Appliances.

3 to 5 p.m.—Cricket party at West Ham Park.

7 for 7.30 p.m.—Association dinner at the Liverpool-street Hotel, E.C.

September 27th.

9.45 a.m.—Annual business meeting at De Keyser's Hotel.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

ASSISTANT WATERWORKS ENGINEER.—August 31st.—Corporation of Madras. £26 13s. 4d. per mensem, and allowance for motor bicycle.—Messrs. James Mansergh & Sons, agents, 5 Victoria-street, Westminster, London, S.W. Envelopes to be superscribed "Waterworks Assistant."

INSPECTOR OF NUISANCES.—August 31st.—Corporation of Wells. £60 per annum.—Mr. E. P. Foster, town clerk.

SANITARY INSPECTOR.—August 31st.—Corporation of Stockport. 35s. per week.—Chairman, Health Committee. Letters to be endorsed "Sanitary Inspector."

SURVEYOR AND INSPECTOR.—August 31st.—Barton-on-Humber Urban District Council. £90 to £100.—Mr. G. H. Nowell, clerk. Envelopes to be endorsed "Inspector and Surveyor."

SURVEYOR'S ASSISTANT.—August 31st.—Leatherhead Urban District Council. 12s. per week.—Mr. Sidney R. Drake, surveyor. Applications to be endorsed "Assistant."

JUNIOR ASSISTANT.—August 31st.—Corporation of Bolton. £70 per annum.—Mr. Samuel Parker, town clerk.

ASSISTANT ENGINEER.—August 31st.—Darjeeling Municipality, India. 150 rupees monthly.—The Chairman.

SURVEYOR.—September 2nd.—Holme Cultram Urban District Council.—Mr. J. H. Gibson, clerk, Wigton. Applications to be endorsed "Surveyor."

ARCHITECTURAL ASSISTANT.—September 2nd.—Hereford County Council. £150 a year.—Mr. G. H. Jack, county surveyor.

ASSISTANT BOROUGH SURVEYOR.—September 4th.—Douglas Town Council. £100 per annum.—Mr. Alexander Robertson, town clerk.

DRAUGHTSMAN.—September 5th.—For the Gas Committee of the Salford Corporation. £150 per annum. Chairman of the Gas Committee.

CLERK OF WORKS.—September 5th.—Corporation of Abergavenny. £3 3s. per week.—Mr. W. H. Hopwood, town clerk.

BUILDING INSPECTOR.—September 7th.—Corporation of Burnley. £2 5s. per week.—Mr. P. Thomas, town clerk.

ROAD SURVEYOR.—September 7th.—Argyll County Council. £90 per annum.—Mr. D. Maclean, Estate Office, Strontian, Argyll.

SURVEYOR AND INSPECTOR OF NUISANCES.—September 9th.—Haverhill Urban District Council. £131 per annum.—Mr. Thomas Bates, clerk. Applications to be endorsed "Application for Surveyor."

CLERK OF WORKS.—September 9th.—Corporation of Coventry. £4 4s. per week.—Mr. G. Sutton, town clerk.

SURVEYOR.—September 9th.—Rothwell Urban District Council.—£105 per annum.—Mr. A. Tyldesley, clerk. Applications to be endorsed "Surveyor, &c."

JUNIOR ASSISTANT.—September 10th.—Borough of Batley. £80 per annum.—Mr. Oscar J. Kirby, borough engineer. Applications to be endorsed "Assistant."

CLERK OF WORKS.—September 10th.—Tavistock Rural District Council.—Mr. A. Kenneth Johnstone, clerk.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

GOOLE.—September 1st.—Competitive designs and estimates for municipal offices, for the urban district council. Two premiums (£30 and £15).—Mr. R. Tyson, clerk.

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

RANGOON.—September 28th—February 1st.—The [illegible] from January 1st to February 1st, 1913. The latest [illegible]

LLANELLY.—September 30th.—Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium.—Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs [illegible] Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—[illegible] Designs for [illegible] the competition. Premiums of 100, 50 and 25 guineas.—Mr. J. Henry Field, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

HYDE.—August 31st.—For building public hall and police courts, for the corporation.—Mr. J. Diggle, borough surveyor.

MINEHEAD.—September 1st.—For building a convenience and cloak-room, for the urban district council.—Mr. L. C. Webber-Incledon, clerk.

MIDLOTHIAN.—September 2nd.—For works at new police station, for the county council.—Mr. A. G. G. Asher, county clerk, County Rooms, Edinburgh.

ABERDEEN.—September 2nd.—For the extension of the fish market, for the corporation.—Mr. W. Dyack, burgh surveyor.

MALDENS AND COOMBE.—September 2nd.—For the extension of the mortuary, for the urban district council.—Mr. R. H. Jeffes, clerk.

COTTINGHAM.—September 2nd.—For the erection of a parish hall, for the urban district council.—Mr. J. S. Moss-Blundell, clerk.

BARNET.—September 3rd.—For building twenty-two cottages, for the urban district council.—Mr. H. W. Poole, clerk.

MERTHYR.—September 3rd.—For the erection of girls' school and domestic subjects block, for the Education Committee.—Mr. E. Stephens, clerk.

JARROW.—September 3rd.—For the erection of a public convenience, for the corporation.—Mr. J. S. Weir, borough engineer.

ARLECDON AND FRIZINGTON.—September 3rd.—For the erection of cart sheds and store-room, for the urban district council.—Mr. J. R. Thompson, clerk.

CARMARTHEN.—September 3rd.—For extensions to a school, for the Education Committee.—Mr. W. Vincent Morgan, county architect, County Education Offices, Carmarthen.

BELFAST.—September 4th.—For the erection of offices, for the Water Commissioners.—Mr. R. Hamilton, secretary, Water Office, Belfast.

KENT.—September 4th—21st.—For the erection of a school, for the Education Committee.—Mr. W. H. Robinson, architect, Caxton House, Westminster.

LEEK.—September 5th.—For the erection of a public convenience, for the urban district council.—Mr. W. E. Beacham, surveyor.

PORTLAND.—September 5th.—For the erection of pumping station and cottage, and fixing borehole pumps, for the urban district council.—Mr. R. S. Henshaw, waterworks engineer.

TOTNES.—September 5th.—For the construction of a culvert, for the rural district council.—Mr. H. Vickery, highway surveyor, South Brent.

WEST RIDING.—September 5th.—For the construction of a bridge, for the Highways Committee.—Mr. F. G. Carpenter, county surveyor.

LYMINGTON.—September 6th.—For the erection of new municipal offices, for the corporation.—Mr. J. Davis Rawlins, town clerk.

WEST RIDING.—September 6th.—For the erection of two new schools, for the Education Committee.—Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

MUIR OF ORD.—September 6th.—For the erection [illegible] for the Urray School Board.—Mr. T. Munro, architect, 62 Academy-street, Inverness.

DERBYSHIRE.—September 7th.—For the erection of a school, for the Education Committee.—Mr. G. H. Widdows, architect, County Education Office, St. Mary's-gate, Derby.

ERPINGHAM.—September 7th.—For the erection of three pairs of cottages, for the rural district council.—Mr. J. T. Willis, deputy-clerk, Cromer-road, Sheringham.

LEIGH-ON-SEA.—September 9th.—For the erection [illegible] works, for the urban district council.—Mr. J. W. Laversedge, engineer and surveyor.

LEITH.—September 9th.—For the erection of a school, for the School Board.—Mr. G. Craig, architect, 85 Duke-street, Leith.

LUTON.—September 9th.—For the erection of public baths, for the corporation. Mr. J. W. Tomlinson, town engineer.

LANCASHIRE.—September 11th.—For the erection of a temporary school, for the Education Committee. —Mr. H. Littler, 16 Ribblesdale-place, Preston.

HACKNEY.—September 12th.—For extension to electricity works, for the borough council. Mr. W. A. Williams, town clerk.

PHILLACK.—September 12th.—For laying down 9 miles of water mains and fittings, the construction of two covered concrete reservoirs, and supplying and fixing machinery, for the urban district council.—Mr. W. G. Kempthorne, clerk.

TOWCESTER.—September 14th.—For the erection of seventeen houses, for the rural district council.—Mr. W. K. Higham, clerk.

GRIMSBY.—September 17th.—For the erection of a council school, for the Education Committee.—Mr. Douglas Chandler, clerk.

BLACKBURN.—September 23rd.—For the erection of public halls, for the corporation.—Mr. L. Beard, town clerk.

Iron and Steel.

LEICESTER.—August 31st.—For the supply and erection of steel roof trusses, lattice girders and columns for the extension of the main car depot, for the corporation.—Mr. E. George Mawbey, borough engineer.

EDINBURGH.—August 31st.—For the supply of 1,670 yds. of 6-in. cast-iron pipes and special castings, for the Water Trustees.—Mr. William Boyd, clerk, 12 St. Giles-street, Edinburgh.

NORWICH.—September 2nd.—For the erection of iron palisading, for the corporation.—Mr. A. E. Collins, city engineer.

Roads.

DORKING.—August 31st.—For surfacing with slag tar-macadam, for the urban district council.—Mr. W. A. Clegg, borough surveyor.

BLAYDON-ON-TYNE.—August 31st.—For making up a road, for the urban district council.—Mr. H. Dalton, clerk.

CASABLANCA.—August 31st.—For the construction of public roads, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

LITTLEHAMPTON.—August 31st.—For the supply of Guernsey or other granite, for the urban district council.—Mr. H. Howard, surveyor.

SAFFRON WALDEN.—August 31st.—For the supply of granite macadam, for the corporation.—Mr. A. H. Forbes, borough surveyor.

SUTHERLAND.—August 31st.—For reconstruction and improvement of county roads, for the county council.—Mr. A. Argo, county clerk, Golspie.

LOUGHTON.—August 31st.—For the supply of granite, gravel and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

SANDWICH.—September 2nd.—For the supply of granite, granite chippings and channelling, for the corporation.—Town Clerk.

BOLTON-UPON-DEARNE.—September 2nd.—For street-making work, for the urban district council.—Mr. J. L. Hawksworth, clerk.

SUNBURY-ON-THAMES.—September 2nd.—For steam rolling and scarifying, for the urban district council.—Mr. H. F. Coales, surveyor.

CAERPHILLY.—September 2nd.—For the supply of 1,000 tons of 2-in. granite, for the urban district council.—Mr. O. H. Harpur, clerk.

BROMLEY.—September 2nd.—For the hire of a steam roller, for the rural district council.—Mr. Edward Haslehurst, clerk.

SALFORD.—September 2nd.—For paving, flagging, sewering and Limmer rock asphalt works, for the corporation.—Borough Engineer.

BROMLEY.—September 2nd.—For the supply of road materials, carting and team labour, for the rural district council.—Mr. Edward Haslehurst, clerk.

MIDDLETON.—September 3rd.—For making up a road, for the corporation.—Mr. W. Welburn, borough surveyor.

SOUTHAMPTON.—September 3rd.—For private street works, for the corporation.—Borough Engineer.

DINAS POWIS.—September 3rd.—For private street works, for the rural district council.—Mr. J. Holden, surveyor, 20 Park-place, Cardiff.

LEITH.—September 3rd.—For laying tar-macadam and Portland cement paving, for the corporation.—Mr. T. B. Laing, town clerk.

HOVE.—September 4th.—For paving and other works, for the corporation.—Mr. H. Indacott, town clerk.

HAMPSHIRE.—September 4th.—For the formation of a footpath and surface drainage, for the county council.—Mr. W. J. Taylor, county surveyor.—The Castle, Winchester.

GLAMORGAN.—September 4th.—For work of widening and improving, for the county council.—County Surveyor, County Hall, Cardiff.

EASINGTON.—September 4th.—For the paving of certain back streets, for the rural district council.—Mr. J. M. Longden, clerk.

SKIPTON.—September 4th.—For the construction of a roadway, for the urban district council.—Mr. Prichard Wilson, clerk.

WESTMORLAND.—September 5th—7th.—For work of road diversion, for the county council.—Mr. J. Bintley, county surveyor, 7 Lowther-street, Kendal.

TOTNES.—September 5th.—For work of road widening, for the rural district council.—Mr. H. Vickery, highway surveyor, South Brent.

SOUTHEND-ON-SEA.—September 6th.—For road and formation works in connection with the construction of a boulevard 1¾ miles in length and 100 ft. wide, for the corporation.—Mr. H. J. Worwood, town clerk.

WORSBOROUGH.—September 7th.—For the widening and reconstruction of a road, for the urban district council.—Mr. J. Whitaker, surveyor.

HANWELL.—September 7th.—For wood paving a portion of Boston-road, for the urban district council. —Mr. Percy Scott, clerk.

BEDLINGTON.—September 9th.—For making up a certain street, for the urban district council.—Mr C. D. Forster, 24 Grainger-street West, Newcastle-on-Tyne.

ITCHEN.—September 9th.—For work in ten roads, for the urban district council.—Mr. T. A. Collingwood, surveyor.

HENDON.—September 9th.—For making up certain roads, for the urban district council.—Mr. S. S. Grimley, engineer, Council Offices.

RABAT (Tangier).—September 10th.—For the construction of two roads, for the Special Committee of Public Works.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

BEDFORD.—September 10th.—For the supply of broken granite, ironstone slag and ironstone tar-macadam, for the corporation.—Mr. C. Stimson, town clerk.

CARSHALTON.—September 11th.—For the supply of 300 yds. of 2-in. and 1,100 yds. of 1½-in. granite, either Cleehill, Quenast, Penmaenmawr or Guernsey, and the hire of steam roller, for the urban district council.—Mr. C. P. Lovelock, clerk.

HESTON.—September 12th.—For relaying wood paving at Hounslow, for the urban district council.—Mr. J. G. Carey, engineer and surveyor, Council House, Hounslow.

PEMBROKESHIRE.—September 12th.—For the construction of a road, for the county council.—Mr. R. A. Wheatley, clerk, Shire Hall, Haverfordwest.

ALVASTON.—September 14th.—For the supply of slag rejections and granite, for the urban district council.—Mr. W. J. Holbrook, clerk, Full-street, Derby.

ALVASTON.—September 14th.—For the supply of slag rejections and granite, for the urban district council.—Mr. W. J. Holbrook, clerk, Full-street, Derby.

ACTON.—September 17th.—For making up two roads and resurfacing several carriageways with tar-macadam, for the urban district council. Mr. W. Hodson, clerk.

EUXTON.—September 23rd.—For making-up work with tar-macadam and ordinary macadam, for the rural district council.—Mr. H. Swetenham, surveyor, 49 Northgate-street, Chester.

Sanitary.

CHELTENHAM.—August 31st.—For the construction of nine combined circular sewage tanks in three sets, and eight percolating filters 101 ft. in diameter, with roads, drains, and conduits, for the corporation. —Mr. J. S. Pickering, borough engineer.

BENTLEY-WITH-ARKSEY.—August 31st.—For carrying out a scheme of main sewerage and sewage disposal works, for the urban district council.—Mr. Geo. Pye, clerk, 17 Priory-place, Doncaster.

ST. AUSTELL.—August 31st.—For the construction of septic tank and percolating filter, for the rural district council.—Mr. John Stephens, clerk.

CHESTERTON.—August 31st—September 14th.—For the construction of a sewer, with manholes, for the rural district council.—The Surveyor, Brunswick House, Cambridge.

ST. COLUMB MAJOR.—August 31st.—For constructing sewers and underdrains, and laying out irrigation ground, for the rural district council.—Mr. Chas. E. Whitford, clerk.

WIRRAL.—August 31st.—For the construction of sewer and manholes, for the rural district council.—Mr. W. Webb Shennan, surveyor.

RHONDDA.—September 2nd.—For scavenging the district, for the urban district council.—The Surveyor.

ASPATRIA.—September 2nd.—For the construction of works of sewerage, for the urban district council.—Mr. F. Richardson, clerk.

BRADFORD.—September 3rd.—For the erection of twenty-eight sludge filter presses at Esholt, for the corporation.—Mr. Frederick Stevens, town clerk.

FAREHAM.—September 3rd.—For scavenging work, for the rural district council.—Mr. A. Laker, clerk.

CLAREMORRIS.—September 4th.—For cleansing a sewer, for the rural district council.—Mr. A. Forde, acting clerk, Claremorris, Ireland.

WALMER.—September 4th.—For the construction of concrete tube and stoneware sewers and surface-water drains, for the urban district council.—Mr. F. W. Hardman, clerk.

LANCHESTER.—September 4th.—For the construction of sewage disposal works, for the rural district council.—Mr. G. W. Westgarth, surveyor.

MILTON.—September 9th.—For extension of sewers, for the rural district council.—Mr. E. Cecil Harris, clerk, 76 High-street, Sittingbourne.

BRADFORD.—September 9th.—For the construction of circular outfall sewer, with observatories and object pillars, for the corporation.—Mr. F. Stevens, town clerk.

TREDEGAR.—September 9th.—For the construction of subsidiary sewers, comprising about 23¼ miles of 6-in., 9-in., 12-in., and 18-in. pipe sewers, with 800 manholes, for the urban district council.—Mr. H. J. C. Shepard, clerk.

HEMEL HEMSTEAD.—September 9th.—For scavenging work, for the rural district council.—Mr. L. Smeatham, clerk.

DARTON.—September 9th.—For scavenging work, for the urban district council.—Mr. J. Gibson, clerk, 3 Regent-street South, Barnsley.

MOTTRAM-IN-LONGDENDALE (Cheshire).—September 9th.—For cleansing ashpits, for the urban district council.—Mr. F. Thompson, clerk, Stalybridge.

BLAYDON-ON-TYNE.—September 10th.—For work of scavenging, for the urban district council.—Mr. H. Dalton, clerk.

WOODALL SPA.—September 11th.—For the construction of a sewer, for the urban district council.—Mr. J. S. Chatterton, clerk.

BEDFORD.—September 14th.—For the construction of delivery tanks, inlet channels, detritus tanks, precipitation and storm-water tanks, the laying of about 1,600yds. of cast-iron pipes, and water mains, for the corporation.—Mr. Chas. Stimson, town clerk.

DARTFORD.—September 16th.—For emptying cesspools and closets, and removing house refuse, for the rural district council.—The Clerk.

EUCKORN.—September 18th.—For removing night-soil.—Mr. G. F. Ashton, clerk.

ANDOVER.—September 21st.—For the construction of screen chamber, engine house, suction tank, 9-in. rising main, circular bacteria beds, and erection of cottage, for the corporation.—Mr. T. E. Longman, town clerk.

LEWES.—September 24th.—For the construction of main intercepting sewers and sewage disposal works, comprising screen chambers, buildings, settlement and storm tanks, tidal storage tanks, sludge drying beds, and low-level pumping station, for the corporation.—Mr. Montague S. Blaker, town clerk.

CAIRO.—September 30th.—For sanitary installations, for the Office of Public Works.—Administrative Service, Public Works Ministry, Cairo.

BRADFORD.—October 9th.—For the construction of circular outfall sewer in tunnel, and two shafts, for the corporation.—Mr. Frederick Stevens, town clerk.

Stores.

ENNISKILLEN.—September 2nd.—For the supply of kerb, flags, channel stones, Portland cement, bass brooms, picks, shovels and stoneware pipes, for the urban district council.—Mr. A. W. G. Ritchie, town clerk.

GOSPORT AND ALVERSTOKE.—September 12th. —For the supply of artificial paving stone, broken stone, brooms, castings, cement and lime, disinfectants, forage, fuel, gravel and sand, harness repairs, kerb, channel, setts and stoneware drain pipes, for the urban district council.—Mr. E. Talbot Palmer, clerk.

BRADFORD.—September 12th.—For the supply of requisites, for the gas department.—Mr. F. Stevens, town clerk.

Miscellaneous.

HASTINGS.—September 14th.—For the supply of horses and carts, for the rural district council.—Mr. A. R. Inskipp, clerk, 11 Wellington-square, Hastings.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ALNWICK. For carrying out water supply works, for the urban district council:—
H. M. Murray & Co., Glasgow, £4,698.

ANNFIELD PLAIN.—For private street works, for the urban district council.—Mr. T. J. Trowsdale, surveyor:

R. Southren, Dipton, S.O.	£172
J. G. Bell, Annfield Plain	164
Lee & Dunn, Annfield Plain	152
Johnson & Strong, Stanley, S.O.*	147

BOSTON.—For building the new town bridge, for the town council:—
Goddard, Massey & Warner, Limited, Nottingham, £5,612.
Temporary footbridge.—W. S. Thompson, Boston.

BYFLEET AND PYRFORD.—For laying 3¼ miles of stoneware pipes, concrete tubes, concrete manholes, catchpits and stoneware gullies, and incidental works, for the rural district council.—The Surveyor:—

A. T. Bullen, Guildford	£5,605
May & Son, Ashtead	5,508
Osman & Co., Southampton	4,717
Wood & Sons, Swanley, Kent	4,158
Ripley, Strong & Co., Farnborough, Hants	3,927
Hardy & Co., Woking	3,650

CLEETHORPES.—Accepted for making up of Bark-street, for the urban district council.—C. H. Wauthman, surveyor:—
Wilkinson & Houghton, Limited, Cleethorpes, £304.

MATLOCK.—For works of sewerage and sewage disposal, for the urban district council.—Messrs. J. Diggle & Son, engineers:—
Sewerage.—P. Dix & Co., Westminster.
Sewage disposal.—J. W. Wildgoose, Matlock.

MERTHYR.—For scavenging work, for the corporation:—
Dowlais district.—C. Davies & Son, £4,550.
Penydarren district.—W. Thomas, £1,197.
Town district, including Park Ward and Georgetown.—R. Harris, £4,660.
Pentrebach, Abercanaid, and Troedyrhiw district.—R. Harris, £990.
Merthyr Vale and Aberfan district.—R. Harris, £690.
Treharris and Edwardsville district.—D. Hughes, £1,110.

RAMSBOTTON.—For works of sewerage and sewage disposal, for the urban district council.—Messrs. J. Diggle & Son, engineers:—
W. Cunliffe & Sons, Limited, Birmingham.

RIPLEY.—For the supply of pipes connecting the council's reservoirs with the Derwent Valley main, for the urban district council:—
Butterley Company.

ROMFORD.—Accepted for the construction of surface-water drains and sewers, for the rural district council.—Mr. W. J. Grant, surveyor:—
S.W. Drain, Brentwood road, Hornchurch.—B. Hale, Romford, £297.
S.W. Drain, Beeconsfield terrace, Chadwell Heath.—B. Hale, Romford, £27.
Sewer, Willow road, Chadwell Heath.—B. Hale, Romford, £55.

SUNBURY.—The following tenders have been accepted by the urban district council:—
Guernsey Granite.—Rowe & Mitchell.
Flints.—Cramer & Co.
Tar-macadam.—Oaks & Co.
Oil.—Trigg.

TYNEMOUTH.—For carrying out scavenging work, for the town council:—
H. Gray, £2,016.

28.—Institution of Municipal and County Engineers: East Midland District Meeting at Ilkeston.

APPOINTMENTS OPEN.

HAVERHILL URBAN DISTRICT COUNCIL.
APPOINTMENT OF SURVEYOR,
INSPECTOR OF NUISANCES AND EXPLOSIVES INSPECTOR.

The above Council will, at their meeting to be held on the 16th September, 1912, proceed to the appointment of a Surveyor, Inspector of Nuisances and Explosives Inspector for their district.

The combined salary will be £131 1s. per annum divided as follows:

Salary as Surveyor	£40 0 0
Salary as Inspector of Nuisances	90 0 0
Salary as Explosives Inspector	1 1 0
	£131 1 0

The appointment as Inspector of Nuisances will be subject to the approval of the Local Government Board.

Candidates must have a thorough knowledge of the duties of the offices and be competent to keep the books and accounts applicable thereto.

The person appointed will be required to devote the whole of his time to his duties, and to give security in the sum of £200.

The appointment will be subject to one calendar month's notice on either side.

Applications, in candidate's handwriting, stating age, present and previous occupation, and accompanied by copies of not more than three testimonials of recent date, endorsed "Application for Surveyor," must be addressed and sent to me not later than 10 a.m. on the 9th day of September, 1912.

(By order)
THOMAS BATES.
Clerk to the Council.

Haverhill, Suffolk.
August 21, 1912.

Minutes of Proceedings.

The Intercepting Trap.

Last week we briefly recorded the issue of the report upon this subject by the Departmental Committee appointed by the President of the Local Government Board, and we now print in full on another page the conclusions, arrived at by the Committee, and various extracts from the report which appear to us to be of particular interest. Our readers should, however, study the report thoroughly, as it will be found to be extremely interesting and valuable. On May 14, 1909, in these columns we dealt with a letter from a correspondent, in the course of which it was stated that "the intercepting trap has given a sense of security to the householder." In reply to this we stated that we considered this feeling of security to be responsible for half the nuisance existing in the ordinary house drain, and that, "although we would not countenance this removal in every case, we do think that, as a nation, we are considerably over-trapped." We now find that the Departmental Committee, after elaborate investigations, has come to the conclusion that the necessity of the intercepting trap, on bacteriological or epidemiological grounds, has not been established; that the smell of sewer air is less perceptible, not more perceptible, when the intercepting trap is omitted; and that it is only in exceptional cases, where the smell from the sewage, due to special circumstances, might be offensive even when discharged at a height, that the intercepting trap may be required. A further statement in this connection is of importance to municipal engineers. The Committee consider that "the question whether, in order to prevent nuisance from smell in such exceptional cases, the intercepting trap is or is not required in any locality, or part of a locality, is one which will need to be considered and determined by the local authority and their advisers, in the light of local conditions."

The original reason for the use of the intercepting trap arose from the belief, then almost universal among sanitarians, that sewer air was one of the most, if not the most direct and commonplace way of all, by which certain infectious diseases were disseminated. The committee naturally directed their investigations to a large extent to this aspect of the question and discuss the results of experiments and observations made in recent years in connection with the bacteriology of sewer air by several scientists. These have been dealt with in these pages at various times (The Surveyor, April 17, 1908; June 25, July 30 and August 6, 1909). A number of special experiments were also carried out for the Committee and a large amount of evidence was collected from a number of witnesses, including medical officers of health, municipal and civil engineers, architects and others. Among the statements made in the report some are highly important and must have far-reaching effects upon present-day methods of house drainage. It is stated in the conclusions that "the bacteriological evidence undoubtedly indicates that the bacterial danger of sewer air is incomparably less than the bacterial danger of drain air, and that therefore the entry of sewer air into a house is of correspondingly smaller importance, bacterially, than the entry of drain air." Again, "the free ventilation of sewers appears to be unnecessary for the prevention of pressure of sewer air on traps;" and "the objectionable features of the fresh air inlet may be overcome apparently without detriment, by omitting this contrivance altogether. The only ventilation which appears to be required on a house-drain, apart from anti-syphonage pipes, is that which should be provided by an opening at the top of each soil pipe." From these statements it certainly seems that the danger which the intercepting trap was intended to prevent is greater in the house drain than in the sewer, and as the provision of the intercepting trap, together with its unsatisfactory accessory the fresh air inlet, only increases the danger, there are very good reasons why these should both be abolished.

It is quite possible that the various experiments described in the report, and upon the basis of which to a great extent the conclusions were arrived at, do not carry conviction to some minds. For such people the case of East Grinstead should be convincing. In the report it is described as a "very striking instance." The town is largely residential with a population of 7,000. There are practically no intercepting traps at all, and no ventilation of the sewers is provided except such as can take place through the soil pipes and ventilating shafts of the house drains. Yet the average annual death rates during the four successive quinquennial periods between 1891 and 1910 were 13·2, 11·9, 9·7 and 9·9 per 1,000 respectively. The rates for enteric fever, diphtheria, and the principal epidemic diseases, including diarrhœa, were also low, and the medical officer of health stated that he has "never had a complaint of smell or nuisance from a house ventilating shaft yet." This is the result of practical experience over a period of years, and we think the report amply justifies the claims of those who wish to abolish the intercepting trap, and represents a great step forward in the progress of sanitary science.

* * *

Ultra-Violet Rays.

A brief review of recent progress in the sterilisation of water by means of the ultra-violet rays is given elsewhere in these pages, and the application of the method to the purification of water supplied in bottles for drinking purposes at Chicago is also described in another article. It appears that in Chicago water taken from the city mains requires double coagulation, settlement and double filtration,

before it is fit to be sterilised, and the fact suggests that there may be a real need for pure bottled water in Chicago. The installation is small, but it is interesting as being the first commercial undertaking for the purification of water in America by this particular process, and, seeing that the method is making headway elsewhere, it will probably be followed by larger and more important installations in that country. In France several municipal supplies are at work. The R.U.V. sterilisers in operation represent a total capacity of 10,000,000 gallons per day. The cheapness and efficiency of the process of actual sterilisation by this means is apparent, but the need for such elaborate preliminary treatment of the water as that adopted at Chicago is apt to convey the impression that, though actual sterilisation is a cheap process, the preliminary treatment required renders it expensive in application. It is, however, to be doubted after all whether this is so. In the first place no body of consumers will drink turbid water. As is very well known, most of the waters in America receive quite as much preliminary treatment before they enter the town mains as is described above. In this country, where the supplies are often derived from deep wells, the water is of so clear a quality that it could be treated without any filtration. For instance, at Cambridge Dr. Sims Woodhead used a violet-ray lamp to treat the raw water drawn from a chalk well where the supply was considered to need sterilisation. In other cases where water is coloured or turbid it is clarified by various processes before use, so that it is quite wrong to imagine that this preliminary process of clarification is necessarily an extra expense where use is made of the ultra-violet rays. What has really happened is this. The experimenters have tried to make the sterilising agent perform the work of the filter, and have failed. This is an old error, and has been made in the case of other sterilising agents and disinfectants. It is the same type of error as that made in attempting to disinfect crude sewage instead of the final effluent.

Whether it is at all probable that the use of bottled water, as in the case of Chicago, is likely to increase, is open to question, but the method would very likely have its uses in the case of aërated waters. Such waters should certainly be above suspicion, and might very properly be sterilised. Sterilised water in bottles would, moreover, be in considerable demand at any place where the public supply was under suspicion, and in America, where typhoid epidemics are of frequent occurrence, there may well be a larger demand for pure bottled water than we in this country should expect. Further, having once suffered from the results of polluted water, the individual affected would probably prefer to err on the side of safety and demand the bottled sterilised water, whether the public supply were safe or not. Thus this somewhat elaborate preparation of the most ordinary necessary of life, combined with extraordinary safeguards in bottling and subsequent storage, may be more necessary than might at first appear.

Age Limits for Appointments.

We have on more than one occasion received complaints in regard to the practice of inviting applications for public appointments from such candidates only as are within specified limits of age. The allegation is that such a course debars many men with a ripened experience from applying for appointments which, being of a public character, should be opened to the widest competition which is reasonable. While we fully sympathise with those older men who are adversely affected by the practice in question, we are unable entirely to agree that it is a wholly bad one. On the contrary, a reasonable age limit appears to us to be highly desirable for two reasons. In the first place, it saves many older men the trouble and expense of applying for posts for which younger men are required and in many cases are more suitable; and, in the second place, it is necessary in the interests of those who are making their first steps in a peculiarly difficult profession. There is no need for the capable assistant who has succeeded in obtaining a permanent (though not a chief) appointment to migrate to the workhouse (as one correspondent has suggested), inasmuch as, even without any guarantee of security of tenure, it is not customary to discharge assistants merely on account of age and in order to replace them with younger men. The suggestion has also reached us that surveyors require young assistants in order to enable them to magnify the importance of their own offices. It is evident, however, that it would be ridiculous and suicidal for a chief to surround himself with an inexperienced and incompetent staff for such a purpose, inasmuch as such a course of action must result in his incurring all the discredit which attaches to inefficient and wasteful administration. In our view the real grievance in regard to age limits is that in many cases they are out of all proportion to the salaries offered and the responsibilities attaching to the positions advertised. The appointment of experienced and senior candidates to posts carrying inadequate salaries is not in the best interests of the profession generally and tends to a general lowering of rates of remuneration. The whole subject, however, is of great interest, and we shall be glad to have the opinions of our readers on it.

The Development of Swansea.

The call of the sea is responsible for an amazing development of municipal enterprise in these islands, which is none the less to be encouraged because it is frankly of a competitive character. Included among the seaside places that have come within the influence of this new spirit is Swansea, which is just now the theme among its many well-wishers of an enraptured prevision that paints its future in the most glowing colours. One ambitious scheme for a Greater Swansea has originated with the *South Wales Daily News*, and this has been the subject of a considerable amount of public comment, some favourable and some hostile. The idea of the scheme is the development of Swansea as one of the chief watering places in the Kingdom, and its laudable purpose finds a hearty supporter in Mr. C. T. Ruthen, who is of opinion that, although the project will involve a huge expenditure of money, "it is, nevertheless, a magnificent idea," which would, however, take many years to fructuate. It is recalled in this connection that some credit is deservedly due to the borough surveyor of Swansea, Mr. George Bell, as a pioneer in these schemes of expansion and improvement, for a year or more ago he presented to the town council a report upon the development of the town which included proposals regarding the foreshore and the reclamation of land. Mr. Bell's main idea—which is also that of those who have followed in his footsteps—was the reclamation from its present sordid surroundings of one of the finest bays in the country. His suggestion was the "neutralisation as far as possible of the unfortunate effects due to the presence of the railway skirting the shore," by a scheme of reclamation that would regain from the railway the front position, and the screening of the line "by a belt of trees at the back of a fine drive." Mr. Bell also visualised the prospect of a new and adequate suite of civic buildings within the limits of the improved area. When so many minds are in agreement upon the possibilities of Swansea's future as a seaside resort, it may be taken for granted that something will be done in time to materialise some such scheme as Mr. Bell foreshadowed in his report to the town council.

Garden Cities and Garden Suburbs.

The letter from Mr. Ewart G. Culpin, the secretary of the Garden Cities and Town Planning Association, which appeared in our issue of August 23rd, points out concisely and clearly the essential distinction between a "garden suburb"

and a "garden city." In a single sentence it may be said that the former is a palliative of existing evils, whereas the latter seeks to profit by the experience of the past, and to prevent the creation of those evils in the new "city." Valuable as is the garden suburb as a means of providing for the city worker a home in healthy surroundings and in acting as an example which may operate to enlighten the confirmed city dweller, it will be recognised that its object is entirely different in character from that of the garden city proper. The latter is the fruit of the imagination of Mr. Ebenezer Howard, who conceived the idea of planning a town to be built on virgin soil in such a way that the central position should be devoted to residential and industrial purposes, and be surrounded by an outer agricultural ring. It is essential for the carrying out of such a scheme that the area of the city should be adequate and that all the affairs of the town should be under the control of some central authority. The science of town planning so far as it affects the municipal engineer has really very little to do with the creation of such a "garden city." It is only in the very rarest instances that an opportunity occurs for laying out an entire city *de novo*. In such cases many of the characteristic features of a "garden city" are retained, but in the usual task which falls to the lot of the municipal engineer—*viz.*, that of making a town plan for the extension or development of an existing town—the underlying principles are entirely different. Mr. Culpin's letter makes a timely appearance and will serve to prevent a confusion of thought which has hitherto existed in the lay mind to a very considerable extent.

The Protection of Roads from Drifting Sand.

A paragraph which appeared in a recent issue (August 23rd, p. 277) relates to a case of serious difficulty arising in dealing with sand drifting on to a road. In the case referred to the depth of the sand upon the road was on an average about 18 in., while in the hedgerows it was 5 or 6 ft. deep. In dealing with a difficulty of this kind it is important that there should be a good understanding between the surveyor and the occupiers of the adjacent land; and it may be suggested that in such cases it is better to take joint action in order to avoid the necessity for the incurring of a continued expense in sand removal than it is to adopt means, however sporting, to drive the other party into a corner. It may not be generally realised that a barrier which may allow large quantities of sand to drift over it may be only a few feet lower than a barrier which would cause the sand to be arrested on its windward side, the sand ridge so formed permanently protecting the road from drifting sand, provided reasonable means be taken to fix the sand-hill by encouraging the growth of suitable grasses. The hedge may, if far enough from the carriageway, be trained so as to encourage the growth of a protecting ridge, or temporary barriers may be used, and when covered by sand, dragged out and placed on the top of the ridge; or cheap materials may be employed, the permanent burial of which does not cause an unreasonable expense. The principle is followed in Egypt with sand, and in Russia with snow, and such expedients are doubtless pursued in many small areas since the idea necessarily occurs to the persons concerned sooner or later. When once the principle is understood the method of applying it can either be worked out on the spot or with the advice of a competent civil engineer.

Overtime.

In another column we publish a letter in which a correspondent discusses the rather difficult question of the working of overtime by assistants in the offices of municipal engineers. The point which he raises is entirely different in principle from that which is involved in those occasional spells of additional work which occur in almost every office at times of special pressure. Provided adequate salaries are being paid, we are of opinion that most assistants will willingly do what is required of them at such times without expecting additional remuneration. It is quite another thing, however, when overtime is required as a regular thing on several evenings a week. As our correspondent points out, such a state of affairs must be due either to bad organisation or under-staffing, and in either case the system operates most unfairly on the junior members of the profession. The work of an assistant to a municipal engineer is not finished when he leaves the office. If he desires to rise in his profession, there are diplomas to be obtained necessitating careful preparation for examinations of no little difficulty. If he is compelled to work at the office regularly until a late hour he is not only being unfairly treated as regards the extra time devoted to his official duties, but he is at the same time being handicapped in his chances of professional advancement. We feel sure that it is only necessary to bring home the nature of the injury which is thus being inflicted on many assistants to those who are responsible in order that it may be mitigated. If necessary, the matter is one in regard to which the Institution of Municipal and County Engineers might take some action such as is suggested by our correspondent, and so show a practical interest in the younger generation of members.

"Dwellings" or Homes.

The evils of the block system of housing were well summed up in a paper which was read before the York Congress of the Royal Sanitary Institute by Dr. J. Wright Mason, the medical officer of health of Kingston-upon-Hull, and some extracts from which were given in our issue of August 23rd. As compared with the cottage, the cost per room is nearly 100 per cent greater, the death-rate is higher —particularly from tuberculosis—and the rate of infant mortality is very much greater. The hygienic evils are due no doubt to the fact that block dwellings do not as a general rule attract the best class of tenant. Moreover, as Dr. Mason pointed out, wherever a common occupancy is resorted to the conveniences and yards become more or less neglected, owing to the responsibility for their cleanliness being a collective instead of an individual one. All things considered, there can be no doubt as to the superiority of the cottage as a home for the working-class family, and so far as England is concerned the block dwelling has not flourished outside London, where the cost of land is frequently so high as to prohibit the erection of cottages from an economic standpoint. In Scotland, however, the block dwelling is very extensively found; but the improvement in means of transit which has taken place in recent years, coupled with the advocacy of the garden city idea, are together operating to induce the erection of cottages rather than blocks on the areas now available.

Madras Water Supply: Progress of the Work.

Following upon our review of Mr. Madeley's report (August 16th), it remains to be noted that the distribution scheme for Madras water supply having been accepted by the corporation and having received the sanction of Government, the work is to be pushed forward with all due speed. Evidences of activity in this direction will have been observed in our advertisement pages, in the invitation for applications for the post of assistant engineer and in the advertisement inviting tenders for some 6,500 tons of cast-iron pipes and "specials," as well as other materials and work. Further tenders may be called for as occasion arises, and it may be as well to note that the contract for the pumping machinery has already been let, and that the steelwork for the elevated tank will not be the subject of open tenders.

Intercepting Traps in House Drains.

DEPARTMENTAL COMMITTEE'S REPORT.

The report of the Departmental Committee appointed by the President of the Local Government Board in October, 1908, to conduct an inquiry with regard to the use of intercepting traps in house drains was, as we have already briefly announced, issued on Wednesday of last week. The investigation nominally originated with a proposal by the Willesden Urban District Council to adopt a series of building by-laws in which the requirement as to the provision of an intercepting trap was to be omitted. The Local Government Board refused their assent to this proposal, but promised that it should be made the subject of a general inquiry, and in due course Mr. Brook Kitchin, Dr. Darra Mair, and Mr. A. A. G. Malet were deputed, as representing the architectural, medical, and engineering departments respectively of the board, to carry it out.

Soon after the commencement of this joint inquiry it became evident that, in consequence of conditions found in intercepting traps in Willesden, an extensive examination of such traps in other districts would be necessary. Accordingly, the assistance of a large number of local authorities of districts near London, where much building under modern conditions has taken place, was invoked. Twelve months elapsed before these local examinations were completed, and at this stage it was deemed necessary, in consequence of the growth of the investigation, to convert the joint inquiry into an inquiry by Departmental Committee. In this committee Mr. Pearson took the place of Mr. Brook Kitchin.

It was contemplated that the committee should visit a number of towns and districts in England and Wales, where conditions illustrative of the advantages and disadvantages of the intercepting trap might be found, but, after consideration, it was decided that it would be more satisfactory and less costly to examine representative witnesses in London, and subsequently to make local investigations and experiments. The committee issued a circular letter therefore to the local authorities of the Metropolis and of the large towns, inviting statements from their expert officers in regard to the main points at issue. They also communicated with various gentlemen of recognised experience in drainage questions, with certain others who had been engaged in special research and investigation in regard to sewer air and drain air, and with the Royal Institute of British Architects, the Architectural Association, the Royal Sanitary Institute, and the Institution of Civil Engineers. The responses to these communications were very numerous, and they comprised many valuable contributions.

Since hearing evidence the committee have also studied a large number of valuable and interesting experiments, the results of which have amply justified the large amount of time which was necessarily expended on them, and which, indeed, has been one of the chief reasons why the report has not been presented earlier. The experiments were conducted and carried out by Mr. W. J. Steele, then the deputy engineer to the Bristol Corporation (now engineer to the Corporation of Newcastle-on-Tyne), in connection with the effect on traps of sewer air and drain air under pressure; by Mr. J. Patten Barber, engineer to the Borough Council of Islington, in connection with the passage of sewage through various intercepting traps; and by Dr. F. W. Andrewes, pathologist to St. Bartholomew's Hospital, in connection with the convection of sewage microbes from sewers to drains, under practical conditions. The last-mentioned experiments were carried out at East Grinstead, with the assistance of Dr. Wallis, medical officer of health, and Mr. W. E. Woollam, surveyor, and at Willesden, with the assistance of Dr. Butler, medical officer of health, and Mr. Woods, chief sanitary inspector.

SUMMARY AND CONCLUSIONS.

We have shown (the committee state in their summary and conclusions) that the disadvantages involved by the use of the intercepting trap are substantial and of serious practical importance, and that as the most important of the effects of these disadvantages are concealed from view, they may remain in existence quite unknown to the householder. On the other hand, the construction of house drainage may be simplified by the omission of the intercepting trap. The disadvantages of the trap may, to some extent, be obviated. Thus, the objectionable features of the fresh air inlet may be overcome, apparently without detriment, by omitting this contrivance altogether. The only "ventilation" which appears to be required on a house drain, apart from anti-syphonage pipes, is that which should be provided by an opening at the top of each soil pipe.

LIABILITY TO BLOCKAGE.

The tendency of the intercepting trap to retain a considerable proportion (averaging, according to our experiments, from 42 to 79 per cent) of the solid matters of the sewage passing through it at any given time, and thus to favour blocking of the trap as well as putrefaction of the sewage before it reaches the sewer, may be diminished to a great extent by using a trap of smaller diameter than is customary at present. The liability of the trap to become blocked appears, however, to be insuperable, and it is this liability which constitutes its most serious disadvantage. The accumulation of sewage in the drain produced by the block and from which many undesirable consequences may follow is not readily evident with ordinary use of the drain, and therefore may long remain undiscovered. This uninspected blocking of the trap and accumulation of sewage appears to be very common, evidence of it having been found in more than 23 per cent of 5,600 traps, which were specially examined.

Although the liability to blocking is inherent in any intercepting trap, its evil effects can be minimised by constructing the house drain of at least the lower part of it of iron pipes, and by closing with a removable cover the usual open channels in the inspection chamber which is provided as a means of access to the trap. The object of these measures is to ensure that the effects of a block at the intercepting trap may become evident as soon as possible, and may admit of easy remedy without nuisance arising, and also to reduce to a minimum the chance of leakage from that part of the house drain which must be filled with sewage before a block at the intercepting trap can be discovered with ordinary use of the drain.

BARRIER TO SEWER AIR.

On the other hand, it seems to be established that the trap does serve as an effectual barrier to the entry of sewer air into the house drain, which is the fundamental advantage claimed for it. It is not liable to be forced and rendered useless, as has been supposed to be the case, by pressure of air from the sewer. This, it would appear, is chiefly because sewers are not air-tight under practical conditions, and therefore air in a sewer finds easier outlets than the water seal of the trap. The pressure which is liable to force the intercepting trap is limited to that which arises in the sewer connection after its opening into the sewer has been submerged, that is to say, after the aërial continuity of sewer and sewer connection has been destroyed. Likewise, the volume of air which can be forced through the trap is limited to that contained in the sewer connection.

Furthermore, when an intercepting trap has been forced in this way, the water seal is not destroyed. When the pressure is relieved the trap will remain sealed, though, it may be, to a less depth than formerly, and therefore air is not liable to pass continuously through a trap once it has been forced.

In the absence of the intercepting trap, the trap-seals in unventilated house-drain are, similarly, not liable to be forced by pressure from the sewer, and they are not liable to be forced even after the sewer connection has been submerged, provided the house drain is furnished with a proper ventilating shaft.

[illegible] owing to exceptional circumstances, such as the absence or the blocking of the ventilating shaft of the house drain, pressure is exerted against the trap on the drain only one trap is liable to be forced [illegible] that which has the weakest water seal. Air from a drain is not liable thereby to pass into a dwelling through a trap, unless it so happens that the weakest trap of all the traps on the drain belongs to

one of the sanitary fittings inside the house. In this connection it needs to be borne in mind again that the water seal of an efficient trap which has been forced is not destroyed. At the same time provision should be made, as indicated in our report, against the tendency of ventilating shafts to become blocked by rust.

The main sources from which air from the sewer may gain entry into a house, in the absence of an intercepting trap, are defects in the drain and the open top of the soil pipe or ventilating shaft, such entry being in either case merely passive, or actively induced by aspiration, in consequence of differences of temperature. The entry of sewer air into the dwelling through defects in the drain may be practically excluded if the house drain is constructed of iron pipes. An iron drain can be made absolutely air-tight without serious difficulty, and usually remains airtight, contrary to what is feasible in the case of stoneware drains. It is probable, therefore, that the entry of sewer or drain air into a house can be limited in practice to what may come from the ventilating shafts outside.

Assuming that, in a given case, air from a drain or from a ventilating shaft can enter a house, the essential question is whether there is any difference, so far as the inhabitants are concerned, between the entry of sewer air plus drain air and the entry of drain air alone. For if, in the absence of an intercepting trap, sewer air, together with drain air, can escape from a given drain or a ventilating shaft into a dwelling, it is equally possible, assuming the presence of an intercepting trap, that drain air alone will escape into the dwelling.

We have collected and carefully considered the chemical evidence, the bacteriological evidence, the results of recent and exact experiments on animals, as well as the general and epidemiological evidence, in their bearing upon the existence of definite risk to health as a consequence of the access of sewer air into the house drain in the absence of the intercepting trap. It is difficult to summarise this evidence, and it must therefore be studied in the body of our report. Briefly, however, it may be said that the chemical evidence shows that the most frequent characteristic of sewer air is the presence of smell. This smell is due to the presence of certain volatile substances given off from sewage in such minute quantities as to be harmless in themselves, apart from smell, or, possibly, to effluvia from moulds which may be attached to the walls of sewers. It is established that the smell of sewer air is only very exceptionally due to sulphuretted hydrogen, contrary to what has been supposed, and that this dangerous gas is usually not present, even in minute traces, in the air of sewers.

BACTERIAL DANGERS.

The bacteriological evidence shows that micro-organisms of sewage origin are very rarely present in sewer air. On the other hand, they may be present in drain air in large numbers. This difference is the result of the splashing of sewage which occurs in drains, and which does not usually occur in sewers. The effect of any given splashing in a drain is of extremely short duration, the bacteria subsiding with great rapidity, but air currents, produced by ventilation, may meanwhile have conveyed these bacteria for considerable distances along the drain or into ventilating shafts of the drain. On the other hand, owing to the rarity of bacteria of sewage origin in sewer air, which has been repeatedly established, opportunity very rarely occurs for their convection, by air currents, from sewer to house drain, in the absence of the intercepting trap; indeed, direct experiments show that the possibility of such convection is so small that its practical importance in relation to danger to health is infinitesimal. The bacteriological evidence undoubtedly indicates that the bacterial danger of sewer air is incomparably less than the bacterial danger of drain air, and that, therefore, the entry of sewer air into a house is of correspondingly smaller importance bacterially than the entry of drain air.

The foregoing evidence is confirmed by experiments on animals which show that while animals may be adversely affected by exposure to the concentrated effects of putrefying excrementitious substances, they are not affected, either in their growth and nutrition or in their susceptibility to disease, by exposure to sewer air.

It is also confirmed by the general and epidemiological evidence, which is to the effect that human beings deliberately exposed to the effects of sewer air do not appear to be affected in health; that the association of the incidence of certain specific diseases, such as enteric fever and diphtheria, with drain defects which allow of the entry of sewer air as well as of drain air into houses, is almost identically the same as the association of similar defects with the absence of disease; and that the experience of districts without intercepting traps does not show that their absence has been harmful.

The necessity of the intercepting trap, on bacteriological or epidemiological grounds, has not therefore been established. It appears, in fact, that the characteristic of sewer air which is of practical importance is its smell, and that, therefore, the question as to the necessity or otherwise of the intercepting trap is narrowed down to the issue whether, in any given case, sewer air will be more perceptible or less perceptible to the sense of smell with or without the trap.

Nevertheless, the question is one of serious public health importance. Human beings vary greatly in their perception of smells, and offensive and unpleasant odours affect the comfort and physical well-being, and probably the health, of the individual. It is obviously most important that public health authorities should make every effort to secure that both sewers and house drains are so designed and constructed that the opportunities of their contributing smell to the atmosphere shall be reduced in every possible way.

EXCEPTIONAL CIRCUMSTANCES.

In ordinary cases the smell of sewer air is less perceptible, not more perceptible, when the intercepting trap is omitted, and chiefly, it would appear, because in the absence of the trap opportunity is afforded for sewer air to escape entirely at a height above the ground. But there are exceptional cases where the intercepting trap may be required, in order to prevent perceptible smell from the escape of sewer air from the tops of ventilating shafts of house drains. Sewage may be so offensive that the escape of sewer air, even at a height, is a perceptible nuisance, so much so that it may be necessary to close as many sewer ventilators as possible, whether at the ground level or at a height; house drains may be connected with cesspools, flat or storage sewers, or with sewers which are old and foul with deposit; houses may be built in terraces, one above the other, so that the ventilating shafts of the house drains of one terrace are at or about the level of the ground of another terrace, and so forth.

As circumstances in this respect will vary in different localities, the question whether, in order to prevent nuisance from smell in such exceptional cases, the intercepting trap is or is not required in any locality, or part of a locality, is one which will need to be considered and determined by the local authority and their advisers in the light of local conditions. Where, however, the trap is considered to be necessary or desirable, the measures for providing against the effects of blocking of the trap should not be neglected—namely, the closure of the open channels in the inspection chamber giving access to the trap, and the construction with iron pipes of the main portion of the house drain, unless this is remote from the house.

VENTILATION OF SEWERS.

The importance of the effect which the presence of the intercepting trap has on the ventilation of sewers, on which much stress has been laid, has probably been exaggerated. The free ventilation of sewers appears to be unnecessary either for the prevention of pressure of sewer air on traps or for the safety of sewermen, except in the case of sewers which are large enough to admit them. Even in such sewers, however, it is dangerous to rely on ventilation alone, and special precautions should always be taken. Moreover, it is exceedingly difficult to ensure that sewers are freely ventilated, even when the most elaborate measures for this purpose are adopted. On the other hand, the prevention of nuisance from smell renders it necessary that any openings which may be deemed to be requisite for the ventilation of sewers should not be at the ground level.

The relationship between the splashing of sewage and the temporary presence of sewage microbes in drain air, and the wafting of such microbes to considerable distances by currents of air, which has been established in the course of our inquiry, appears to be a matter of practical importance, whether the intercepting trap is present or not. The bacteriological evidence suggests that if exposure to drain air is related, as many suppose it is, to attacks of

sore throat or other septic affections, the explanation may be found in the liability of drain air, unlike sewer air, to carry in suspension large numbers of microbes of sewage origin. It is desirable, therefore, that the possibility of splashing should be taken into account in the construction of drains, in order that it may be reduced to a minimum. It is likewise important, whether the intercepting trap is present or absent, that the tops of soil pipes and of the ventilating shafts of house drains should be as remote as possible from windows, not only with a view to avoid smell, but also to minimise the chance of sewage microbes, which may be present in drain air, being wafted from them into the dwelling.

EXTRACTS FROM THE REPORT.

The following are some of the more important passages in the committee's report:

DISADVANTAGES OF THE INTERCEPTING TRAP.

The alleged disadvantages of the intercepting trap fall into four groups. One is that it forms an obstacle to the passage of air from the sewer through the house drains and the ventilating shafts thereof to the external air, and that, consequently, the ventilation of sewers is rendered both difficult and costly. As this alleged disadvantage is claimed by those who favour the trap to be its chief advantage, we do not propose to discuss it at this stage, though we refer to it later on. Another disadvantage urged by many is that the trap involves separate ventilation of the house drains, and that this necessitates the provision of a fresh air inlet to the drain, which, owing to the capricious nature of air currents, often acts as an outlet for foul air, and becomes a nuisance. A third objection is that the intercepting trap complicates and enhances the cost of the construction of house drains, not only by reason of the addition of the trap itself, but also from the necessity of providing the air inlet to the drain, proper means of access to the trap, and in other ways. Lastly, the trap is objected to on the ground that it forms a serious impediment to the passage of sewage from the house drain to the sewer, and that this frequently results in more or less complete blockage of the drain. . . .

ADVANTAGES.

An incidental advantage claimed for the intercepting trap is that it prevents the passage of rats from the sewer into the house drain. Apart from the undesirability on general grounds of the presence of rats in and about houses, such an advantage might be of very great importance in connection with plague. It appears to be doubtful, however, whether the intercepting trap is a barrier to the rat, for rats have been observed to pass through it, both from the drain into the sewer and from the sewer into the drain. Mr. Patten Barber informed us that he had seen rats chased into the inspection chamber of a drain, where it was supposed that the intercepting trap would have checked their further progress, but it was found that they had escaped through the trap into the sewer. Conversely, Mr. Woods, the chief sanitary inspector of Willesden, informed us that, during the reconstruction of the inspection chamber of a house drain, he saw three or four rats, in succession, come through the water in the intercepting trap from the sewer and disappear into the house drain. . . .

The experience of East Grinstead and other places suggests that, in ordinary circumstances, the absence of intercepting traps tends to make sewer air not more, but less, perceptible to the senses. In East Grinstead there are no sewer openings at the street level, and there are practically no intercepting traps, and the medical officer of health states that he has "never had a complaint of smell or nuisance from a house ventilating shaft yet," although previous to the closure of street manhole covers there had been serious nuisance from the escape of sewer air. On the other hand, the experience of places like St. Helens and Burton-on-Trent suggests that, in exceptional circumstances, it may be necessary to provide intercepting traps expressly to prevent sewer air from becoming evident to the senses, for the same reason that it is necessary to close as many as possible of the ventilating openings in the sewers. . . .

BACTERIOLOGY OF SEWER AIR.

This accumulated bacteriological evidence, which exhibits very few discrepancies, establishes the essential fact that the number of micro-organisms in sewer air is extremely small. This is established not only in the case of good sewers and those which are well ventilated, but also in the case of bad sewers, even those containing more or less stagnant sewage with much deposit, and those in which ventilation is small or absent. Indeed, it is in the latter kind of sewer that the number of sewer air microbes would appear to be at a minimum.

It seems also clearly to be established, not only that the bulk of the bacteria of sewer air are derived from the atmosphere, but also that bacteria of sewage origin—that is, those that may be pathogenic—are very rarely present in sewer air, and that when their presence can be detected at all their number is very small. In this respect the older investigations, such as those of Dr. Haldane and Prof. Carnelley, and of Mr. Parry Laws, have not been seriously shaken by the most recent investigations. Moreover, as will appear presently, it is probable that the occasional presence of sewage organisms in sewer air is dependent on splashing. . . .

BACTERIAL DIFFERENCE BETWEEN SEWER AIR AND DRAIN AIR.

It is evident from the foregoing investigations that there is a material difference bacteriologically between sewer air and drain air, for, while bacteria of sewage origin are rarely found in sewer air, and when found their number is very small, in drain air, on the other hand, not only are sewage microbes frequently found, but also, when present, their number may be very large. While this general statement indicates broadly what is commonly characteristic of drain air in contrast with sewer air, it is subject to certain qualifications. For instance, Prof. Winslow's experiments show that, although many sewage microbes may be collected on plates exposed to drain air for more or less considerable periods, the number of such microbes, when quantitatively estimated in relation to measured volumes of the drain air, is very small.

Again, it is scarcely open to doubt that the bacterial difference between sewer air and drain air is accounted for by the splashing which occurs in the passage of sewage in a house drain, especially when falling from a height or passing through a trap. Indeed, since the presence in large number of sewage microbes in drain air has been shown to be so directly associated with splashing of sewage in a drain, more especially by the investigations of Dr. Andrewes, the presumption is strong that, if there were no such splashing, sewage microbes would be as seldom present in drain air as in sewer air. It is obvious that sewage, flowing along a drain, is not likely to give up its microbes any more readily than sewage flowing along a sewer has been shown to be.*

It is also established by Dr. Andrewes' experiments that the presence of sewage bacteria in drain air, as the result of splashing, lasts only a very short time, and that they subside with great rapidity. The appearance of sewage bacteria after splashing is doubtless effected, not by the ejection or active disengagement from the sewage of the bacteria themselves, but by the detachment from the splashing or disturbed sewage of more or less minute drops of sewage. If the passage of sewage or water through an intercepting trap be watched, as, for instance, in an open experimental installation like that used in the Islington experiments, it will be observed that droplets are frequently thrown off from the liquid, sometimes to an astonishing distance. Besides these comparatively large visible droplets, there must be many so minute as to be invisible, and it is from such minute droplets that Dr. Andrewes concluded that the plates used in his drain air experiments were mainly infected. It is possible that the enclosure of microbes in droplets helps to explain their extremely rapid subsidence, which was such a striking feature of his experiments.

But, notwithstanding that the presence of sewage bacteria in drain air is subject to the foregoing reservations, the broad fact remains, and must be accepted as an essential practical point, that sewage bacteria are frequently present in drain air, although such bacteria are usually absent from sewer air.

PRACTICAL IMPORTANCE OF THIS DIFFERENCE.

The practical importance of this essential bacterial

* Major Horrocks concluded from some of his experiments that sewage bacteria might be detached from the internal surface of drain pipes after they had become dried, but it is doubtful whether such drying as was effected artificially in his experiments can be anything but a rare occurrence under practical conditions in this country, while it is certain that in sewers there is always great humidity of the air and that their walls are always moist. In soil pipes, however, particularly those exposed to the sun, there may be such drying.

difference between sewer air and drain air is very great.

One of the dangers feared from the omission of the intercepting trap is that pathogenic microbes given off from sewage may be wafted from the air of the sewer into the house drain, and thence into the dwelling itself. It is obvious, however, that if, as appears usually to be the case, micro-organisms of sewage origin are not present in sewer air, there can be no wafting of pathogenic microbes from sewer to drain as has been apprehended. It is likewise obvious that if sewer air contains, as apparently it does contain sometimes, such microbes of sewage origin, but so few in number that their presence can be demonstrated only with difficulty, the chance that they can be wafted into a house drain is very small, while the chance that any of them can pass further and enter the dwelling itself must be smaller. Consequently, even if in any particular instance sewage microbes can gain admission into a house from the air of the drain belonging to it, the possibility that such microbes can include any derived from sewer air if the intercepting trap is absent must be very remote.

On the other hand, the bearing of the frequent presence of sewage bacteria in drain air needs to be clearly recognised. It is contended, for instance, that an intercepting trap, though in no way operative as protection to a dwelling-house from the entry of microbes derived from the air of the drains belonging to it, will at least ensure the house, however remote the chance of such an occurrence may be, from the entry of microbes (*viâ* the sewer) which may be derived from the sewage coming from the drains of other houses. But clearly the bacteriology of drain air shows that theoretically it is possible for a dwelling-house to be invaded by microbes, derived from the drains of other houses, irrespective altogether of intercepting traps.

Thus the air inlet of a drain, as we have shown already, may act as an air outlet, and smell from it may affect persons other than those resident in the house to which it belongs. Again, the air outlet or ventilating shaft of a house drain may be so situated as to affect, so far as may be judged by smell, residents of houses other than those of the house to which it actually belongs. Therefore it is conceivable that, in cases where the smell of drain air is wafted to persons other than the residents of the house by the drain, sewage microbes of drain air origin may be wafted to them also. It may be true that, though such a contingency is conceivable, it is only a remote possibility. On the bacteriological evidence, however, it can scarcely be denied that it is a less remote possibility than the wafting of microbes from sewer air to drains, and thence in whatever way to the interior of the dwelling, since in the latter case microbes of sewage origin are seldom present in sewer air, while in the former case microbes of sewage origin are frequently present in drain air.

In other words, while an intercepting trap may guard a house against a bacterial danger through the sewer which appears indeed to be almost non-existent, it does not exclude the possibility of drain air microbes finding their way from one house to another through other channels, involving bacterial danger theoretically not inconsiderable. Indeed, it might not unreasonably be argued that in the ventilating shafts of house drains lies the principal bacterial danger, and that the free ventilation of house drains, which is usually associated with the provision of an intercepting trap, is itself calculated to foster the dispersal of drain air microbes in the neighbourhood of houses. It might even be contended, on strictly bacteriological grounds, that any ventilation of house drains or the provision of any external openings in them is wrong, and constitutes a possible danger, since in the absence of air currents, brought about by ventilation, such microbes, however numerously suspended they may be in drain air as the result of splashing must merely subside and remain in the drain itself.

We are not suggesting that this is a serious danger, although it is possible that it may have some importance in relation to sore throat, and perhaps other illnesses. It is necessary, however, to make quite clear what is the logical outcome of the bacteriological evidence that microbes of sewage origin are frequently present in drain air, and seldom present in sewer air. That the danger in question is probably not serious seems to be indicated by the fact that in the air of London microbes of sewage origin can very rarely be detected, even after the exposure for many hours in likely places of plates coated with media specially designed to demonstrate their existence. It follows, however, that if danger of this kind through drain air is not of importance, the danger that sewage bacteria of sewer air may find access into the interior of a dwelling *viâ* the drain owing to the absence of an intercepting trap must be still more unimportant.

PASSAGE OF SEWAGE MICROBES FROM SEWERS INTO DRAINS.

Nevertheless, as one observer (Major Horrocks) found by experiment in Gibraltar that test microbes introduced into a sewer from a house drain may be recovered from another and neighbouring drain in direct aërial connection with the same sewer, we thought it desirable that further direct investigation should be made. When, therefore, Dr. Andrewes offered to make experiments suggested by us in the course of his further observations for the Local Government Board on the bacteriology of drain air and sewer air, we asked him to include investigation on this point, especially as to the numerical extent to which such sewer air microbes might pass into drains. . . .

These experiments, even assuming that the first experiment at Willesden was not vitiated by accidental contamination, confirm, therefore, as conclusively as may be expected, the deduction to be made from previous observations establishing the rarity of the presence of sewage microbes in sewer air—*viz.*, that under practical conditions the chance of sewage microbes passing from sewer air to drain air is very small, and that their chance of passing further from the drain into the dwelling and thence into a human being must be still smaller. It needs to be remembered, moreover, as Dr. Andrewes has pointed out in his report* to the board on these experiments, that the test microbe was present in the sewage to the number of hundreds per c.c. in one case, of thousands per c.c., in another case, and of at least a million per c.c. in another case, and that "no one has suggested that pathogenic bacteria are ever present in sewage in numbers approaching this."

In contrast with the results of these experiments, a further series made by Dr. Andrewes at St. Bartholomew's Hospital may be mentioned. On four successive days he discharged culture of b. prodigiosus from the water-closet on one or other of the four floors of one of the hospital blocks, four 2-in. plates having been previously suspended, one above the other, inside the top of the soil pipe with which they are connected, and also a similar tier of plates in an adjoining pipe (constructed like a soil pipe) into which the sink wastes on each floor discharge. Both these pipes open at the top, discharge below into a single inspection chamber provided with an intercepting trap, but not with an air inlet, so that the two pipes referred to are the only available channels for air currents from or to the inspection chamber. On all four occasions Dr. Andrewes recovered the test microbe from both pipes, thus confirming the results obtained by Major Horrocks in a somewhat similar experiment. On two occasions the number of the test microbes recovered was very small, in one pipe or the other, but usually it was considerable. Thus in the case of the soil pipe the numbers of test microbes were on the four days 47, 153, 64 and 2 respectively, and in the case of the sink waste pipe 34, 7, 127 and 118.

The results of these experiments emphasise the point to which we have already referred—namely, that the bacteriological evidence indicates that, if any bacterial danger exists at all in house drainage, it is to be found in the drain air that may escape from the outlets of ventilating shafts of house drains. But even this danger requires to be regarded in its true perspective, as we have pointed out.

SEWER AIR AND DISEASE.

In the earlier days of epidemiological investigation it was common to attribute outbreaks of many spreading diseases to the influence of emanations from decaying animal matter, or of effluvia from drains and sewers. Indeed, as we have mentioned in the opening of our report, these influences were regarded at one time as being the most direct and commonplace of all agencies by which such diseases were disseminated among human beings. But as first one and then another agency of disease came to be identified, it became less and less frequent to attribute disease to mere foul emanations, including those from sewers and drains. It has been suggested to us that this

* Third Report on the Bacteria of Sewer Air and Drain Air, with special reference to the Conveyance of Sewage Bacteria by Air Currents, by F. W. Andrewes, M.D. Annual Report of the Medical Officer of the Local Government Board, Vol. xl., p. 387. 1910-11.

change has been the result, not so much of fallacious interpretation of facts by earlier observers, but of the careful and costly measures which have been taken during the last thirty to forty years to protect the public from the influence of emanations from sewers and drains. At all events, although sewer air is not generally regarded in such a dangerous light as it formerly was, there is no doubt a considerable body of medical opinion which retains the view that certain diseases, notably typhoid fever, diphtheria, quinsy and sore throat, and certain "septic" diseases, are fostered, or are even actually produced, by exposure to sewer air or drain air.

On the other hand, many believe that if past prevalences of disease attributed directly to sewer air could be reinvestigated in the light of present knowledge, some other explanation of the facts ascertained would be patent, and that emanations from drains and sewers, though they may be extremely objectionable to the senses and harmful in the same way that any offensive air may be, are not the cause and do not foster the spread of any disease. Thus Dr. Haldane expressed the opinion in his evidence that the theory of sewer air infection was based on "worthless evidence," and that, as a general rule, "illness was put down to sewer air if the cause was unknown," particularly so "at the time when the influence of water and of milk and of personal infection was really not understood." He was even "very suspicious of the theory" that sewer air, apart from its smell, can be a predisposing cause of disease.

It is clearly impossible to prove, by direct evidence, either the one proposition or the other—either that emanations from sewers were actually the cause of epidemic illness in the past, and would be so again if opportunity offered, or that these conclusions were wrong and that such emanations do not cause epidemic illness. Nevertheless, it may be said that it is by no means the case, at the present time, that opportunity does not exist for sewer or drain emanations to foster disease if they are capable of doing so, and that our present knowledge as to the influence of personal infection, of infected water, of infected food, of infected dust, and so forth, does afford presumption that some at least of the conclusions of the earlier investigators may have been erroneous. . . .

ASSOCIATION OF DISEASE WITH DRAIN DEFECTS.

In the investigations to which we have already referred, in which there had appeared to be direct causal relation between disease in human beings and exposure to sewer air or drain air, it is probable that this supposition has often been based on the frequent association of disease with drain defects. It is a common routine practice to examine the drainage systems of houses on the occurrence therein of the more important infectious diseases, and the frequency with which this has revealed the existence of drainage defects, permitting of the possible entrance into the house, sometimes of drain air alone, sometimes of drain air mixed with sewer air, has been regarded as affording presumption that the two facts were directly connected. For example, it has been stated that in one town out of 196 invaded houses as many as 89, or 45 per cent, had defective drains; and that in another town out of 548 houses invaded with typhoid fever, 151, or over 29 per cent, exhibited drain defects, and so on. It is obvious, however, that even such frequent association of disease and drain defects does not afford any presumption of causal relationship between the two, unless it can at least be shown that the existence of drain defects is very much more common in houses invaded by disease than it is in houses not invaded by disease. . . .

EAST GRINSTEAD.

A very striking instance of this kind is provided by East Grinstead, a small town of some 7,000 inhabitants, in Sussex. Although this town is largely residential, there are practically no intercepting traps at all, and no ventilation of the sewers is provided, except such as can take place through the soil pipes and ventilating shafts of house drains. Dr. Wallis, who has been medical officer of health of this town for many years, informed us that he has been unable to trace any ill-effect on the health of East Grinstead to the system of drainage in use there, and he submitted statistical data in support of this view. These show that the annual general death-rate in East Grinstead during the last twenty years has always been low, ranging from 14·2 to 8·9 per 1,000. During the four successive quinquennial periods between 1891 and 1910 the average annual death-rates were 13·2, 11·9, 9·7 and 9·9 per 1,000 respectively, as compared with 18·7, 17·7, 16·0 and 14·6 per 1,000 respectively in England and Wales. During the same period thirty-one cases of enteric fever were notified in East Grinstead, an average annual attack-rate of only 25 per 100,000 of the population. Diphtheria, likewise, has had a small incidence there, while the average death-rate from the principal epidemic diseases, including diarrhœa, was also low—*viz.*, 0·9 per 1,000.

It is important to note that from time to time drain defects similar to those found in other places have been found in East Grinstead, and that the measures taken in regard to defects in house drains are similar to those taken in other towns. Nothing exceptional in this connection has been done.

GERMANY.

Mr. Durham brought to our notice the experience of certain towns in Germany in this connection. In Germany it is unusual to provide an intercepting trap on the house drain, and in many towns the trap is actually prohibited. Mr. Durham informed us that the omission of the trap originated with an Englishman, the late Mr. Lindley, the designer of several sewerage systems on the Continent. Mr. Lindley was opposed to the principle of the intercepting trap, holding that the house drainage system should be regarded as an integral part of the sewer system, and this, we understand, is the accepted view in Germany.

Mr. Durham has himself had large experience in Continental drainage work, and he informed us that he has never heard of any complaint being formulated in Germany as a result of the absence of the intercepting trap, although, owing to the severe winters there, the house drainage pipes, which are above ground, are placed inside the house. Indeed, he stated that the only important German town which, in his experience, insisted on the provision of an intercepting trap—*viz.*, Cologne—had since 1896 prohibited its use, and that in that town many existing traps had since been removed.

Mr. Durham gave us much interesting information as to German methods in the drainage of houses, the most important of which was in regard to the German method of construction of sink and bath waste pipes. These do not discharge into the open air, as is usual in this country, but into a common waste pipe similar to, but of smaller diameter than, a soil pipe, and ventilated like a soil pipe. These pipes, like the soil pipes, are placed inside the house, and are constructed of iron. In Germany underground pipes are usually constructed of cast-iron with lead joints, and if stoneware pipes are used the joints are made with asphalt and not with cement.

The vital statistics of certain German towns which have been sewered in recent years were submitted by Mr. Durham as showing that the omission of the intercepting trap has not done harm. Without laying undue stress on these statistics, it is suggested that, if the admission of sewer air into house drains is likely to be a factor in the dissemination of disease, it might be expected that the lowering of the general death-rate and that from typhoid fever, which usually follows systematic drainage of a town, would be absent or less marked in those towns which have not required the intercepting trap. There is no evidence of this, however, in the available statistics. The improvement of health after systematic drainage seems to have been quite as striking in these towns as in many English towns under like circumstances, both in Cologne, which formerly required the trap and in the other German towns which did not. The following figures are taken from the annual summary of the Registrar-General of England and Wales:—

In Berlin the general death-rate has fallen from 26·5 per 1,000 in the quinquennium 1881-1885 to 15·5 per 1,000 in 1906-10, or by 41½ per cent; in Hamburg from 25·2 to 14·8 per 1,000 in the same periods; in Dresden from 25·0 to 14·7; in Breslau from 31·3 to 21·2; in Munich from 30·4 to 17·4; and in Frankfort from 19·7 to 13·8. In Cologne* the death-rate fell from 26·6 in 1881-85 to 17·5 per 1,000 in 1906-10, or 34 per cent.

The statistics as regards mortality from enteric fever are similar. For the same quinquennia, 1881-85 and 1906-10, mortality from this disease in Berlin amounted to 23 and 4 per 100,000 respectively; in Hamburg, 28 and 4; in Dresden, 18 and 4; in Breslau, 29 and 5; in Munich, 17 and 2; and in Frankfort, 12 and 2. In Cologne the mortality amounted to 25 and 3 respectively.

* In 1888 Cologne was enlarged by the incorporation of many outlying places. The death-rate from all causes in the quinquennium 1891-95 was 24·4 per 1,000, and that from enteric fever 12 per 100,000.

AMERICA.

In the course of our inquiry we have also received interesting information from America. The tendency there appears to be to abandon the intercepting trap, and, although we have no statistical information, we understand that where it has been given up or its provision is not enforced no harm has resulted.

VENTILATION OF SEWERS.

So far we have dealt with the question of the intercepting trap without reference to the ventilation of sewers. We have done so intentionally, because, as we pointed out at the outset, the objection adduced by opponents of the trap that it prevents the ventilation of the sewer by the house drain is regarded by those who favour the trap as the main reason for retaining it. But now that we have investigated the advantages and disadvantages of the trap apart from their bearing on sewer ventilation we may briefly consider the latter point of view.

The opposing contentions are, on the one hand, that the intercepting trap makes the ventilation of sewers difficult and costly, and that without the trap the ventilation of sewers may be effected through the soil pipes of house drains safely and without nuisance; on the other hand, that it is the business of the responsible public authority to make independent provision for the ventilation of public sewers, and that it is improper to make use of house drains for this purpose, not only because they are private property, but also because, even if such a proceeding is unlikely to cause illness, it may be offensive from the escape of sewer air near windows and chimneys.

As to the latter objection, we have already pointed out that the experience of East Grinstead and other places shows that the result of using private house drains for ventilating sewers is, usually, not to increase, but to lessen the nuisance that may arise from the escape of sewer air. There can be no doubt, too, for it has been repeatedly proved, that, so far as nuisance is concerned, the escape of sewer air at a height is much to be preferred to its escape at the ground level.

IMPORTANCE OF SEWER VENTILATION EXAGGERATED.

On the other hand, it is probable that in the controversy that has taken place upon the intercepting trap too much importance has been attached to the question of sewer ventilation, for there is a considerable amount of evidence which indicates that the necessity for ventilation of sewers has been exaggerated.

The ventilation of sewers—and by this term we mean the free and systematic ventilation of sewers—is usually regarded as necessary for two main reasons—*viz.*: (1) To prevent the forcing of drain traps inside and about houses by pressure of air from the sewer, and (2) to enable sewer men to do their work in safety.

As regards the prevention of pressure on house traps, we have already detailed experiments which show that, even in Bristol, in spite of the absence of any designed sewer ventilation, pressure on the intercepting trap did not arise when the sewer was surcharged until the opening of the sewer connection in the sewer was submerged, and that, therefore, if the intercepting trap is absent, pressure on the house traps, such as that of a water-closet, is likewise not liable to occur until the sewer connection is submerged.

As to the pressure on the intercepting trap, which in the Bristol experiments arose after the submersion of the sewer connection, we have also pointed out that not only can this pressure not be avoided by any system of sewer ventilation short of the ventilation of every sewer connection, but also that similar pressure on house traps is manifestly unlikely to occur when the intercepting trap is absent, if the pipe to which house traps are connected is ventilated in the customary manner.

It appears therefore that, for the purpose of preventing pressure of sewer air on house traps, the necessity for the independent ventilation of sewers is not established, and that, as we have already explained, this is mainly because it is impracticable to make systems of sewers airtight.

Furthermore, the experience of Bristol does not suggest that a system of sewers which is not ventilated is attended with more risk to sewer men than a system which is freely ventilated. Sewer men in Bristol have been singularly free from accident, although it appears that before men are admitted into a sewer the usual precaution taken is to open several adjoining manholes about an hour beforehand, a precaution which is commonly taken in towns whose sewers are freely ventilated.

There is evidence to show, however, that, under any circumstances, great care should always be exercised in the case of large sewers, in which men can walk, to ascertain that the interior is safe before men are admitted, and that the existence of means of free ventilation should never be regarded as a sufficient safeguard in itself. The history of accidents which have occurred shows that dangerous conditions may arise very unexpectedly in large sewers. For instance, in a case at East Ham, investigated by Dr. Haldane, where five men were suddenly overcome and drowned in a large outfall sewer, it appears that the spot at which the accident happened was regarded as quite safe, and that men had been in the habit of entering the sewer there daily for several years without taking any special precautions. Yet on the fatal occasion a man entering in the usual way was observed to fall at once into the sewage, and four men who followed in succession to the rescue of their comrades were similarly overcome. Dr. Haldane's investigations showed that this disaster was caused by sulphuretted hydrogen, but the conditions which gave rise to the accumulation of this dangerous gas could not be exactly determined, although it was surmised to have been due to the combined effects of a high temperature and a shortage of public water supply, which led to unusually rapid putrefaction of sewage, both in the sewers and in the intercepting traps of house drains.

There have been somewhat similar accidents elsewhere in ventilated sewers, and Dr. Haldane is of opinion that in some cases the disturbance of sewage, caused by men wading in it, has led to the unexpected evolution of sulphuretted hydrogen.

A new danger has arisen of late, we understand, from the occasional discharge of petrol into sewers. This proceeding requires to be sternly repressed, not only because it may imperil the lives of sewer men, but also because of the risk of explosion. Ventilation of sewers cannot be an effectual safeguard against this danger.

In the case of sewers which are too small for men to enter, which, as a rule, include those of a smaller diameter or height than about 3 ft. 6 in., it would seem that the need for their ventilation, on account of risk to sewer men, hardly exists at all, and that the important requirement is that the manhole chambers on such sewers are safe when men have to descend into them. To ensure this it is usual to open two or more adjoining manholes, so as to induce currents of air for the time being.

If, therefore, the objection to the intercepting trap rested solely or mainly on its interference with sewer ventilation, we should be inclined to question the importance of such an objection.

DIFFICULTY OF VENTILATING SEWERS.

In this connection it may be mentioned that, in places where more or less elaborate means of sewer ventilation have been adopted, their efficacy in actually producing ventilation appears to be often in doubt. In Manchester,* for instance, where several methods of sewer ventilation were experimentally tested for prolonged periods, the best proved to be one in which mechanical means were employed, air being extracted from the sewers by fans and admitted at various regulated inlets. It was found, however, that the air in the sewers was not affected more than about 180 yds. from the exhaust, and that the volume of air entering at the inlets was much less than the volume extracted by the fans, although the sewers under examination were made as airtight as possible, by providing every sewer connection with an intercepting trap and by closing all known openings except the regulated air inlets.

Again, the factors which govern the movements of air in sewers are so complicated and uncertain that it appears to be quite impossible to foretell whether any given opening in a sewer will act as an inlet or as an outlet for air. Even when a tall shaft is erected close to an offensive street manhole, with a view of causing the manhole to act only as an air inlet, it sometimes happens that the manhole continues to act as an offensive outlet.

In Leicester the sewers are very freely ventilated, for not only are intercepting traps uncommon, but many independent sewer ventilating shafts are also in existence. It appears that the object of providing the latter was largely with the view that they would act as outlets for sewer air so that the ventilating shafts of house drains would act as inlets for fresh air. Mr. Mawbey, the borough surveyor of Leicester, has

* Reports to the Manchester Corporation upon the examination of the air of sewers upon which systems of artificial ventilation were tested, T. de Courcy Meade, 1901, and A. S. Delepine, 1906.

carried out numerous systematic observations on the air currents in the sewer ventilating shafts, and he has found that, although generally the velocity of the outgoing air was greater than that of the ingoing air, they acted frequently both as air inlets and as air outlets, even within brief periods of time. Thus in 1,042 observations on thirty sewer ventilating shafts (6 in. by 4 in.), each observation lasting fifteen minutes, the anemometers recorded 619 down currents and 1,002 up currents. Many shafts, therefore, acted both as air inlets and air outlets during each observation, while some never acted as outlets. Similarly, with twenty shafts of larger size, in a total of 575 observations, the instruments recorded 449 down currents and 547 up currents.*

Moreover, it is necessary to point out that, if the ventilation of sewers and the exclusion of sewer air from house drains by intercepting traps were proved to be necessary, it would be requisite to make provision for the separate ventilation of every sewer connection, for, as the Bristol experiments showed, it is only when the aërial continuity of sewer and sewer connection is interrupted that sewer air is likely to pass into the house drain. Such a system of ventilation would be not only costly, but difficult, if not impossible to carry out generally, for it would involve the erection of ventilating shafts on, and their projection above, the fronts of houses, to which there is naturally great objection. If the intercepting trap is omitted, however, the ordinary house drain ventilating shaft at the back of the house serves as outlet, not only for air from the sewer itself, but also for air from the sewer connection, after its opening into the sewer has been submerged.

STERILISATION OF WATER BY ULTRA-VIOLET RAYS.

RECENT PROGRESS.

The adoption of the ultra-violet rays for the sterilisation of water by several municipalities in France, as well as by numerous hospitals, industrial concerns and private establishments, shows that this new method is making considerable headway. It is also to be observed that the "R.U.V." sterilisers, which have been successful, as stated above, in France, are now being introduced into this country by Mr. Philip J. Bertin, so that we may look forward to seeing trials made at home upon a proper commercial scale.

The process is of recent origin. The first patent relating to sterilisation of water by means of the ultra-violet rays was that of De Mare in the year 1906. The research work of Messrs. Henri, Helbronner, and von Recklinghausen at the Sorbonne University of Paris is of recent date. Minor experiments have been made in this country, while in America the first commercial undertaking has not been working very long.

It appears that while ordinary light produced at low temperatures, such as that from gas, incandescent filament lamps, &c., is poor in ultra-violet radiations, the sources of light based on the incandescence of vapours are extremely rich in ultra-violet rays. Thus the mercury vapour lamp enclosed in a quartz container is used. These lamps have a very long life, and are therefore economical.

Experiments have shown that the water has the power of absorbing the ultra-violet rays to a very great extent, and it has therefore been found necessary to construct the apparatus so that as little air space as possible is interposed between the lamp and the water which has to be treated. Of course, it is now generally understood that the rays exert a germicidal effect upon the water. It is, however, necessary to have a small air space between the lamp and the water, otherwise the temperature of the lamp is increased, and as a consequence the light power is decreased and the efficiency of the lamp is lessened. The temperature of the lamp is maintained at a few hundred degrees centigrade. Also it has been found that lamps which are in direct contact with the water are apt to become covered with scale, which, being impermeable to the rays, interferes with their work of sterilisation. Similarly it has been found necessary to work with a perfectly clarified water in order to obtain good results. In the R.U.V. system the water is passed under a single lamp and is agitated so as to turn over and over any dust particles contained likely to obstruct the action of the rays on the micro-organisms which such particles of solid matter. Further, in order to make the whole system as safe as possible all the treated water is automatically excluded from the reservoir of sterilised water by means of an electric connection between the quartz lamp and an automatic valve, so that the untreated water is shut off upon the failure of the electric current.

Perhaps enough has been said to demonstrate that the process has passed beyond the experimental stage. Sterile water for public use is now a practicable possibility, and the merits of the ultra-violet ray system must recommend it for serious consideration. The cheapness and simplicity of the plant and absence of chemicals in the water are advantages which cannot be overlooked, and which should go far to ensure the successful application of the method in England.

A CHICAGO INSTALLATION.

An account is given in the *Engineering Record* of New York of plant for the filtration and sterilisation of Lake Michigan water at Chicago. This water is used in a bottled water service for drinking purposes. As this is probably the first application of the ultra-violet rays to sterilisation of water on a commercial scale in America, it is of special interest. The plant deals with 150 gallons per hour, and has been in operation since March 14th of the present year. The process consists of coagulation, sedimentation, double filtration and sterilisation by means of the violet rays of a Cooper-Hewitt quartz tube mercury vapour lamp.

An ordinary small-sized lamp is enclosed in a 11½-in. diameter case. The ordinary glass globe used to cut out the rays is omitted, and a 5-gallon copper cylinder is substituted. The water enters the bottom at the periphery of the can in a tangential direction, rises to the surface and flows over a cylindrical baffle and under a second concentric baffle, and finally escapes by a 1-in. overflow pipe in the centre. It was found that the mercury-vapour tube gave best results when placed 2½ in. above the surface of the water. The water from the city mains is used and is treated with ½ to ¾ grains of aluminium sulphate per gallon, after which it is allowed to settle for two or three hours. It then passes through two 20-in. diameter pressure filters, and before entering the second filter it receives from ½ to ¾ grain per gallon of the coagulent. This, we are told, is absolutely necessary in order to obtain sterilisation by the violet rays. Even with this amount of preliminary treatment erratic results were at first obtained. These were found to be due to small bubbles of free air (arising from the removal of pressure on the water issuing from the filters) causing the water to be too cloudy for proper working. Thus an additional open tank had to be inserted on the line.

In the consumption of current the installation is said to be too small to warrant giving any figures. Current for a 110-volt 4½-ampere lamp is obtained at the rate of 8 cents per kw. hour. The cost of the process and the price paid for the bottles of water are not stated. Elaborate precautions are taken in cleaning the bottles and in corking them. Further, the vessel in which the water is stored ready for use is cleansed and sterilised by means of a portable violet-ray lamp, which is set down over the jar for five minutes.

Problems in Engineering with Solutions.*—The English journal THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER carries on a section devoted to various questions which might be put in an examination for the position of municipal engineer in an English town or city. The questions are given one week and answers provided by various correspondents given in subsequent issues. The volume noted above is the first one to be made up from these questions and answers. As is well known, the position of municipal engineer in England is one of most varied activity, so that the subject covered by the questions and answers extends through the whole field of engineering. For example, the chapter headings are as follows: Mechanics and Hydrostatics; Strength and Elasticity of Materials; Theory of Structures; Surveying and Levelling; Water Supply and Hydraulics; Sewerage, Sewage Disposal, Road Making and Railways; Building Construction and Materials; Law and Miscellaneous. While the questions and most of their solutions are distinctly British in character, the wide range of subjects and the method of treatment make the book of some value to American engineers. There is a good deal to be said in favor of the question and answer method of instruction.—*Engineering News.*

Institution of Municipal and County Engineers.

ANNUAL GENERAL MEETING IN LONDON.

(*Conclusion.*)

The last of the series of papers submitted for the consideration of the members of the Institution of Municipal and County Engineers during the second day's proceedings at Caxton Hall, Westminster, is reproduced herewith:—

HOW THE NEW DISTRICT COMMITTEES MAY PROMOTE THE PROGRESS OF OUR INSTITUTION.

By A. HORSBURGH CAMPBELL, M.INST.C.E.,
City Engineer, Edinburgh.

[*From Photo by D. M. Lee & Son, Blairgowrie.*

This paper will of necessity be brief: not that the subject with which it deals is in any way to be considered a small one, but that with respect to the object of the paper there can be but one opinion, and that is the desirability of the new district committees each becoming a source of strength, a centre of influence, and a power for good among the members in particular, and, indirectly, those serving in the "rank and file" of the profession within the respective districts and not yet connected with the institution.

That there is a great field still to cultivate, that there are many eligible men who still hold aloof from our ranks, either from indifference, for lack of that *esprit de corps* that should unite us, or because of their attachment to other bodies, is an admitted fact, and it is to be hoped that the new constitution and the introduction of new aggressive work and of personal influence may tend to the gathering in of such as ought to be members of one flock and units of one incorporation. It is only right in passing to give a meed of praise to our retiring president, who during his year of office has induced a greater number of meetings, obtained larger gatherings at those meetings, and generally quickened interest to a degree not attained by any of his distinguished predecessors, and in this way has caught the spirit of the times, and has given a send-off to the new life of the institution; but the immediate purpose of the paper is to endeavour to carry on this revived interest, to excite action where not yet aroused, and to give opportunity to the members of the institution by the submission of this paper for free discussion and ventilation for the diversity of view and expression of the varied opinions which are entertained in regard to the methods and means to be applied in the progress of our institution.

I do not mean by such progress merely increase of members, but primarily for increase of usefulness, of professional and scientific betterment, and for those things which weigh even more heavily and which bulk more prominently than that of mere numerical strength. That there is much scope for this must be patent to all thinking ones, when we consider that as yet we are too much as separate units where we might be a combined organisation, our efforts too much of an individual kind rather than those of an organised body, so that we find:—

(1) The multiplicity of associations and institutions with their manifold branches instead of one powerful whole; we find division and disunion instead of that "unity which is strength." But how are those divisions to be healed and this institution to become a vehicle of power and influence professionally?

Chiefly, I answer (1) By the agency of the district committees, and indirectly (2) by the co-relationship of districts with central headquarters; (3) by means of an official magazine; (4) by the establishment, in connection with our institution, of an intelligence bureau; and (5) by the granting of a Royal Charter. The last named of these, and probably the most important, can only hope to be obtained when the other steps have been successfully scaled.

(1) *By the Agency of District Committees.* It is well here to refer to the new Articles of Association and by-laws constituting those district committees.

Article 35 says: "District committees of the association may be formed, and district secretaries appointed, in accordance with the by-laws for the time being of the association, and there shall be referred to such committees all such local or other business and matters as the by-laws for the time being shall prescribe, or as may be specially referred to them or any of them by the council; but the acts and resolutions of the district committees shall not be binding upon the association unless approved of by the council"; and, again, in By-law 11, it is provided "for the purpose of promoting the increase and extension of professional science, knowledge and practice, and the interchange of views thereon, for educational purposes, and for the promotion of the professional interests, rights, powers, and privileges of the members, and the improvement of their professional status, and for the election of district representatives of the council, the United Kingdom, and such parts of the British Empire as are hereinafter mentioned, shall be divided into the following districts . . .," and so on, to the number of some fifteen districts in all.

Although occupying such little space in the printed matter, four great countries and continents comprising districts twelve to fifteen are considered so unimportant as to be disposed of in one short line—*viz.*, Scotland, Ireland, India and Africa; and in the course of the same section it is provided "that each district committee may arrange for such meetings in its district as it thinks fit, but the business at such meetings can only be for the purpose above mentioned, and such business as is incidentally necessary thereto."

I proceed now to discuss how our progress may be promoted:—

(1) *By the Agency of District Committees.* The formation and constitution of those district committees is set forth in the extracts above given; but it must not be supposed that those committees—if they are at all to realise their utility and to rise to their expected level—will be restricted in their meetings or their services to the mere letter of the constitution bringing them into being.

The printed constitution is but the skeleton of the body, but the dry bones to the living reality. This reality must consist of the putting on of flesh, and the stirring to the depths of that as yet untouched body of opinion and of skill that still holds aloof, and that must be brought into a living unity with us as an institution.

I suggest for the consideration and discussion of the members the following methods, among others which it is hoped will be submitted by members at the meeting, and which is indeed one of the purposes of this paper:

(1) Each district committee, being representative of a group of counties, may within its own sphere subdivide into counties.

(2) Each district should have a strong executive committee for the management and administration of its own affairs.

(3) Each district should, within itself, be a self-governing part of the whole, and should be permitted to realise its own independence.

(4) To maintain the corporate unity of the institution, the district committees should be united by the medium of the general council of the institution and the permanent officers at headquarters.

(5) An officially recognised magazine or *Surveyors' Chronicle* should be established, with the editor-in-chief responsible to the institution as one of the headquarters' staff.

(6) Such an organisation, actively maintained, must eventually lead—in combination with other municipal services—to one result—*i.e.*, the granting of a Royal Charter providing for efficiency of qualification, standardisation of skill, protection in the zealous and capable performance of duty, and mutual support and defence of members.

The foregoing are only suggestive, and not by any means exhaustive of the sphere of influence which our institution may yet command. I observed at a recent meeting our friend Mr. E. J. Elford, of Southend, the secretary of the Eastern District, asked for suggestions as to those new district committees. It was a sign of the times; the darkness before the dawn of that new day of restored energy and activity of life at headquarters, as well as in the remoter part of our realm.

But to elaborate briefly the several suggestions above submitted:—

(1) *Districts and District Committees*—with sub-division into county areas.

It will be felt, I think, that the districts created by the new constitution are still too large in area and too widespread in membership for them to exert the influence they otherwise might. Districts which, for instance, comprise five or six administrative counties of England, and in another instance the whole of Scotland, and, again, the whole of Ireland, cannot be considered sufficiently identical in local experience, and must be still too large and scattered to permit that frequency of contact which is so needful if interest is to be maintained.

Periodically (such as once, or preferably twice, a year) it is well that members resident in the same district should come together; but this infrequency of meeting is not calculated to knit so closely together the members as, say, a monthly—informal—meeting can do. Of course, it will be said, "Oh, what is the good of systematising down to the county unit?" I answer, "Because the county unit is a well-defined, homogeneous area, possessing in its county council, and in its several urban and rural district councils as local governing bodies, certain close community of interests, kindred concerns, and facilities for frequent meetings of the officers to discuss, learn and profit by." (2) The county unit has already been tried and found not wanting in the Kent county surveyor, the Somerset county and the Thames Valley surveyors, although possibly the last-named is not strictly the county of survey. Sufficient experience has now been obtained of those and kindred county sub-divisions of our institution to be assured that those can only be for good, and that their multiplication through the length and the breadth of the land is to be desired. This increase can only be successfully accomplished through the agency and under the guide and direction of (1) the general council, but more particularly and in detail by (2) the district committees.

The general council, as the focus and centre of influence, unifying and assimilating the many distinctly local efforts, aiding by advice, guiding by experience, and encouraging by cash aid where necessary those new forms of activity, and, secondly, the district committee being more local by lending the practical assistance of its officers in the setting up in each county within its own area of a county association or other suitable sub-section, officered not necessarily by the district officers, but by its own local chairman, secretary and committee. The functions and duties of these last named would necessarily be small, but not by any means unimportant. They would be in their initiative executive officers, responsible through the district committee, and thereby to the council of the institution, for the growth, interest and life and zeal of their county members. It is not from Westminster that the outposts will be moved won and saved but by the persuasion of one's self to the immediate neighbourhood. The meeting in those outposts will then find that there are not bad townships or isolated defaulters, but a body of colleagues of a good kind, operating really at all times to aid by advice, to stand together in meeting, and to defend (if need be) by financial contribution and moral support unjustly impeached

(2) *District Executive Committees and Officers.*—It is upon them more than aught else will depend the progress of the institution under their respective areas. They are the intelligence department between the suggested outpost officers, and the headquarters' permanent staff. Upon them will depend whether their districts are to be active centres of influence for pushing along the work, and for reviving and maintaining interest; which can only be done by frequency of meeting, enabling the formation of professional and personal friendships, having in each district, say, two meetings annually, one a summer meeting for district business and for visitation of works, and one a winter meeting for discussion of papers on some scientific or professional topic, to be followed or accompanied, say, by an annual district soirée, or other form of social gathering.

And here I would beg leave to utter a note of dissent from that phrase in the new by-laws which provides that "All members," &c.—that is, of the institution—"shall be invited to attend the various district meetings;" this is quite superfluous, a waste of stationery, stamps, time and money, which I trust the council may speedily correct. As illustration, take the recent annual meeting of the Scottish district at Stirling. There we were honoured by three or four visitors only from England, none from Ireland, none from Wales. Yet, according to By-law 11, every member, associate member and student—about 1,400 in all—is individually invited by a postal communication for the sake of about sixty local members and three from across the border; or, again, take the recent East Ham meeting, with an attendance of about thirty-six to forty all told, no less than about 1,400 to 1,500 invitations are sent out, and this waste of everything repeated on the occasion of each meeting ! ! that one is disposed to ask, "To what purpose is this waste?" when, moreover, the fact of the meeting can be read in the technical Press over and over again. I respectfully submit that if we notify personally the district members only and announce in the Press notice of the meeting, "Members from other districts are cordially welcome by due notification to the district secretary," that this wanton waste of paper, printing, stamps and time will be saved to the institution, and the district secretary much relieved.

But the district committees can do more than arrange two meetings annually; they can come in to fill the void between the private members and the council that sits only at distant intervals at Westminster; they can be the medium of intelligence, the centre of information, the seat of succour to the brother down on his luck through some mischance that may have lain in wait upon him. I would, however, throw out this hint to my colleagues upon the council, and invite the consideration of the members to the proposal for the council itself to be more migratory, and less fixedly Westminster in its place of meeting. There are about twelve districts, excluding India and Africa; why not change the venue of our council meetings so that, say one a year or thereabouts, the council, by holding its business meeting in that district, will come into close touch with the particular affairs of each district, without neglecting its duty to the whole institution? The presence of the council once annually in each district could only react with benefit upon both the council and the officers and members of that district. But, further, the district committees can, by their diligence, call into being that merely strictly local county administration already referred to. If they fail in this needed growth of our institution work, who shall succeed? And I would therefore commend this propaganda to their best consideration.

(3) and (4) *Each District to be Self-governing, and through the Secretaries to be in constant touch with Headquarters.*—This is essential to success; each must work out its own salvation along lines suited to its own locality, subject always to the nominal oversight and veto of the council to be evoked only in case of crisis or of need—that is, not interference from headquarters. That is allowing latitude and freedom for the expansion and development of the institution along the varied channels and by the many ways that lead out of individual effort and official freedom, and the district committees may therefore vie with one another in bringing each forward new forms and ways suited to its own locality. But although self-governing it is to be desired that the council should have the benefit of new ideas and fresh district developments, so that they as the central governing body may communicate such developments to other districts. Therefore another reason for the council to be migratory in its

meetings, and for frequency of correspondence, constancy of communication between general secretary at headquarters and the hon. secretary of each district is to be encouraged.

(5) *An Official Magazine to be Published.*—It is said, "Of making many books there is no end." This doubtless is so, but the initiation of a magazine—to be published quarterly to begin with—is an equipment much to be desired of the strictly official work of our institution. Consider what it may not accomplish for us, as the intelligence domestic bureau for its nearly 1,500 members as the voice and vehicle of official information concerning the work, ways, and progress of the institution in its various districts, as a medium of direct interchange of individual and official thought and opinion on matters professional, and, it may be, officially personal; further, as the collector and distributor of information, as the statistical centre and publisher on matters of solely institution interest; as the publisher of official minutes, notices, reports, &c., connected with the institution.

I do not suggest that such a magazine or chronicle should reproduce *in extenso* those papers and reports, many of which (like the present) may be a weariness of the flesh, but that there is a need for some such magazine, and a sphere for some such chronicle, is patent when it is remembered that, if we are to keep ourselves individually abreast of current professional views and literature, we have weekly to go through the countless columns of almost countless publications, to extract therefrom those tit-bits of information which appeal to our peculiar and personal needs and tastes. What is wanted in our professional literature is such a time saver as a surveyor's review giving ready references to things that matter to us as municipal and county engineers; so that we might go for further information to any particular article in the particular paper containing the article.

Such a chronicle as I suggest, capably edited by one more or less in responsible touch with the council, has possibilities we cannot forecast for the betterment of our institution. It would be, as regards purely institution business, the full record; and as regards science and art as applied to our work, the informer and reference to the articles in other press publications. It would not, therefore, be competitive in any way with the existing technical press, which is so full and informative on such matters; but supplemental to that press on the important inner affairs of our institution, and that which really matters to us as a profession.

(6) *Royal Charter.*—This surely is an aim worthy of us all. It may be but as yet an idle dream, an airy phantasy; still, it is a consummation worthy of our best aim. If it inspire us to proper purpose, to sustained integrity, to continued good work in the straightening up of crooked ways, and making plainer and easier for the multitudes we serve life's rough paths, we shall have at least merited that mark of Royal favour in the granting of a charter that will enfranchise our profession in this League and Union of Honour, and give it that material strength that shall wield power to defend collectively as our duty a member and a brother unworthily aspersed, and to succour him and them who, through no fault of their own, are falling in the race.

May I hope, in conclusion, that the submission of these suggestions will induce a host of others which can point the way of work to our council and officers for the continued progress of our institution and the betterment of our work in our respective spheres of public service?

DISCUSSION OF MR. CAMPBELL'S PAPER.

Mr. J. L. Redfern (Gillingham), in proposing a vote of thanks to Mr. Campbell, said he had read the paper with great interest. He was sure the district committees would not lack subjects for discussion. There was no want of interest in the professional side, but what he should like the district committees to do was to pay particular attention to the material welfare of the rank and file. The questions of superannuation and security of tenure were both prominently to the front, and although superannuation was finding favour with the local authorities, it was difficult to convince people that security of tenure would be beneficial to all parties. But he thought so, and the district committees would have to look into the question very closely. They would have to keep pestering every authority, both Government and local, to grant them what they wanted at as early a date as possible. They knew the extent to which members of public bodies were hindered in the discharge of their duties, he himself had found it necessary to bring an action for libel last year against a local paper. He was successful in being awarded both damages and costs, and was able to get hold of the costs. He did not press for damages, as he did not want to be vindictive. But it was not everyone who came out as successfully as that, or who felt disposed to go to court, and he thought it was the duty of the district committees to investigate such cases, so that when a member was being subjected to a system of pinpricks the committee could be communicated with and some sort of remonstrance lodged. While some good would come of that, certainly no harm would result. When members knew they had the support of their institution they would feel in a stronger position than at present. Another direction in which the committees could assist would be in scrutinising advertisements and drawing the attention of local authorities to the inadequate salaries which were frequently offered in connection with official appointments, and it was his hope that they would do their utmost to improve the status of assistants. Miserable salaries were offered to these men after they had spent years of their lives in study and work, and it was a shame that advertisements of the kind he referred to should appear. In his own office one of his assistants who applied for an increase of £20 was offered yearly increments of £5, but on his (Mr. Redfern) protesting, the assistant got the £20 in one sum. He considered that the stepping-stones to the higher places in the profession should be made easier for the junior members.

Mr. F. R. Phipps (Basingstoke), seconding the vote of thanks, said the paper before the meeting was one of the most vital they had had, and it was the duty of the council and the members generally to consider it earnestly and see what they could do to improve their status. It was difficult to know what effect any representations of the district committees would have on councils who offered inadequate salaries, for the latter were likely to point out that the institution possessed no charter like the Institution of Civil Engineers, and it was therefore essential that they should go forward and get recognised by the powers that be. Possessed of a charter, their recommendations would have greater force. The county associations had been very successful where formed, because members had felt in the past that the institution covered such a wide area that they could not get local representation, and could not afford to travel great distances to the places where the meetings were held. The question of a journal to represent the institution was rather a difficult one. He thought they owed a debt of gratitude to the papers which catered for them at present, and he thought they had almost enough journals of the kind. His opinion was that it would be a difficult matter to "run" such a paper; it would be an advantage, but difficult to carry through.

Mr. E. Willis (Chiswick) supported the vote of thanks. Speaking as to the importance of securing unity before trying to get a charter, he said they must endeavour to draw into their ranks all the young men and most of the older men now outside their organisation, even though they might not be the most highly qualified. That done, they might stand a chance of obtaining a charter of incorporation. The Institution of Mechanical Engineers had not been able to get one; even the Institution of Electrical Engineers had been opposed. The terms on which the Institution of Civil Engineers admitted members did not cover the ground for members of this institution, and on that point he thought they had a chance if they could be unanimous. The district committees were too large to give the amount of help they looked forward to getting. A helpful point would be for a list of meetings and visits to be published, if possible, at the beginning of the session, and then members could make arrangements accordingly. They would have larger attendances if members had this information beforehand.

Mr. W. Harper (Cardiff) said he was sorry to strike a dissenting note. Mr. Campbell had covered a great deal of ground, but he could not see that he had broken any that was fresh. There was a lot of superficial talk, but no practical suggestions as to what the district committees could do. He was afraid, too, that if they followed Mr. Campbell's ideas of entering into all kinds of things at their district meeting that, instead of creating that unity which was essential, there would arise differing factions, with the result that they would have disunity everywhere. There was a word of caution he wished to throw out in all seriousness. He did not like the Socialistic element disclosed in the paper, and in particular was averse to the project of independent control by the various

district committees. He had no sympathy either with the idea of an itinerant council. Mr. Campbell had not, in proposing that the council should meet at twelve different places during the year, suggested a secretary's office on wheels. How could they conduct their business without their secretary and books of reference? As they knew, all the main railway lines led to London. He should like to see the council meet in Cardiff, but how many of the members could they expect to attend a meeting held there? He very much doubted whether they would get the necessary quorum, and he trusted that the proposal which had been put forward would not be entertained for a moment by the district committees.

The vote of thanks was carried.

The President (Mr. R. J. Thomas) said he had the utmost confidence that the district committees would be loyal to the council, and had no doubt that each district would so discuss the subject as to arrive at an amicable arrangement.

Mr. Campbell, in replying, said he had only one observation to offer as to the discordant note from Wales. They generally looked to Wales for light and leading, but that day Wales had treated them to a shower of cold water which had brought no refreshment with it. If his own had been only superficial talk he had hoped that Mr. Harpur would have contributed to the enlightenment of the meeting rather than have derided the efforts made by one of his colleagues on the council.

VISIT TO AYLESBURY.

Mr. Campbell's was the last of the ten papers which were considered during the two days' sitting at Caxton Hall. On the third day of the meeting the members travelled to Aylesbury, the county town of Bucks, where a paper on the municipal works of the urban district—reproduced in our issue of August 23rd last—was read by the engineer and surveyor to the local authority, Mr. W. H. Taylor.

The members were welcomed on arrival by the chairman of the Bucks County Council, Mr. Tonman Mosley, and Mr. Nippin, the chairman of the Aylesbury District Council, the former in the course of his remarks paying a warm tribute to the work of the president (Mr. R. J. Thomas) in his capacity as county surveyor. Alluding to the improvement of the highways which Mr. Thomas had effected, Mr. Mosley said there had been many difficulties to overcome, but he thought evidence of the adoption of up-to-date methods would be found wherever one went in the county. Acknowledgment of the welcome extended to the institution was made by Mr. W. Nisbet Blair (St. Pancras) and Mr. C. F. Wike (Sheffield), and the president added some words in appreciation of Mr. Mosley's remarks. Although not a native of the town, he had had the pleasure of living in Aylesbury for twenty-two years. Aylesbury had been very kind to him, and he had tried in a small way to take his share in its joys and sorrows, and he hoped to continue to do so.

In the discussion which ensued upon Mr. Taylor's paper,

Mr. C. Vawser (New Barnet) congratulated the author upon the low cost of tar-painting—0·748d. per super. yard—in Aylesbury. In regard to street lighting, Mr. Taylor, in referring to the change from flat flame burners to No. 4 Kern and large incandescent burners, had not stated what increase of illuminating power was obtained. Then as to the disposal of sludge-cake, was this rendered difficult during the summer owing to the lack of fertilising power?

Mr. G. W. Lacey (Oswestry), commenting on the low cost of road work—10·75d. per super. yard—put an inquiry as to the rate of wages paid for labour. Haulage at 6s. 6d. was also low. Working out the number of super. yards paved, the use of 135 tons of granite meant a coating of stone only 2 in. thick, and he thought that was a rather light coating. Mr. Taylor had used crude tar for painting roads and it was a point to be noted that the use of ordinary gas tar in many places appeared to meet with success. Many of them had been rather afraid to use crude tar on account of its varying quality, and had fallen back upon distilled tar and proprietary articles. Concluding, Mr. Lacey said he would like to know what had been the experience with grain te chippings as compared with sand for spreading over the tarred surface.

Mr. E. J. Elford (Southend-on-Sea) asked the reason for using flints when granite could be obtained for only 1½d. per yard more.

Mr. J. F. Smillie (Tynemouth) suggested that if effective team labour was obtainable at 6s. 6d. per day it would be much cheaper than keeping horses.

In closing the discussion, the President complimented Mr. Taylor on the way in which he maintained his roads for the county council. There had, he said, been a very distinct improvement in these roads in recent years, and that without any great increase in cost.

Mr. Taylor, in acknowledging a vote of thanks passed to him, explained that the tar-painting at 2s. 6d. per yard included only the paving, and not the 6 in. of rubble underneath. The No. 4 Kern burner gave a candle power of 120, and an average of 80, and the large incandescent burner from 150 to 170. The difficulty which arose in connection with the carting away of the sludge-cake arose only during haytime and harvest, when the farmers were too busy to send for it. The granite coating was of an average thickness of 2 in. to 2½ in. Labourers' wages in Aylesbury were 18s. per week. He preferred to use granite chippings in the direction suggested, but the cost would be much greater. Flints were used in a few side streets, but this form of paving was being gradually superseded by granite. He could not agree with Mr. Smillie on the question of horse-keeping, for he found that the work was done better with their own horses.

In the afternoon the Hon. Walter Rothschild's museum and the beautiful grounds of Tring Park were visited by the members, a number of stoppages taking place *en route* at points where excavations had been made in the road surface in order to illustrate the methods of construction adopted. On the return to Aylesbury tea was provided at "The Chantry" by the president, this kindly and much appreciated hospitality bringing the annual meeting to a close.

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesy."
GEO. HERBERT, *"The Temple."*

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

To the Editor of The Surveyor.

Sir,—Referring to the paper which I had the honour to submit at the last annual meeting of our Institution of Municipal and County Engineers on the developments open to the institution for the progress and prosperity of its membership, I beg to send you herewith a letter which I have received from Mr. Thomas S. Picton, borough engineer, Eccles, Lancs, which he has given me permission to send for publication with a view to inviting correspondence on this important subject.

I shall be glad if you will find space for it in your valuable paper.—Yours, &c.,

A. H. Campbell,
City Engineer.

Engineer's Office,
Parliament-square,
Edinburgh.
September 2, 1912.

[COPY OF LETTER REFERRED TO.]

Dear Mr. Campbell,—Had there been time on Friday, the 12th inst., I fully intended having something to say on your paper, which you have clearly put before the members at our annual meeting in Caxton Hall. I may say I am in entire agreement with your theories. For purely propaganda and social work arranging the business of the institution into counties is very practical. Take, for instance, the North-Western District—comprising Lancashire, Cumberland, Westmorland, Cheshire, and the Isle of Man—except for the ordinary stereotyped district meeting, what chance have we got to bring all our members occasionally together in the winter for a social function, or during the summer for a day's outing or visit to some works of importance? None whatever. If a county division could be arranged, it would be much easier to accomplish, and I am sure would be very much appreciated by our Lancashire members.

Your next idea of the council holding its ordinary meetings occasionally in the provinces—has this ever been tried? If not, I cannot quite see the drift of the remarks of Mr. Harpur, of Cardiff, when he said that itinerant councils would be the means of causing a disunion in the institution. I cannot accept his argument. There is not such an accumulation of business in connection with the council's work that would necessitate *all* the books of the institution being brought to that particular council meeting. I think all the minute books, &c., that would be required for an ordinary

The Surveyor
And Municipal and County Engineer.

council meeting could be put into a Parliamentary tin box, and sent off to, say, Edinburgh, Manchester, Exeter, Scarborough, Chester, or Newcastle, as the case may be, and the members of the council would naturally follow if they so desired. Where is the difficulty? The question of any extra expense would be very little, if any; and, looking at the attendance list during the last few years, some country members of the council have put in very bad attendances, even now when all the meetings are held in London (except the two annual meetings in the provinces). I think Mr. Harpur is making a great difficulty out of a very little matter.

About your idea of a magazine or review purely for officials, and on professional subjects and work. I welcome the idea, if it can be carried through in a proper manner, and edited by an accomplished engineer who thoroughly understands the work of a municipal and county engineer, and who would make it a "review," and not for advertisements only, but, as you have expressed it, "a time saver." If this "review" can be produced monthly at, say, 1s. or 6d. per month, it would, I feel sure, be taken up by most engineers, especially if the services of Mr. H. P. Boulnois or any other able engineer could be secured as editor of such "review."

Unless there is a little bit more life and enthusiasm put into the work of the districts, very little real progress will be made in our institution, and the chances of obtaining a Royal Charter few and far between. Our annual meetings are just over, and we hope to see each district get soon to work and inaugurate a policy of advancement on every line which may benefit the institution, so that all may meet together for mutual help and assistance, and also to stimulate our assistants and pupils to become attached to the institution, and consider it their home.

The "forward men" of the council *must* quicken the paces of the more conservative members. Unless we desire to be swallowed up by the "other society," *we must* be more progressive in our policy, and cater for the "younger members of our institution." I hope, Mr. Campbell, you will not be afraid to voice your opinions in the council meetings, and thus apply your gifts on behalf of the rising generation of members, who desire to see our institution the *first* in the United Kingdom.

Yours faithfully,

Town Hall, Eccles. THOMAS S. PICTON.
July 22, 1912.

[Mr Campbell's paper, and a report of the discussion which followed its presentation at the annual meeting, appear elsewhere in this issue. Ed. THE SURVEYOR.]

OVERTIME IN MUNICIPAL ENGINEERS' OFFICES.

To the Editor of THE SURVEYOR.

SIR,—May I invite your assistance and that of your readers to remedy or mitigate what I consider a great injustice to many assistants in municipal engineering offices? I refer to the overtime which in some of the larger offices is systematically enforced throughout the winter months, and to some extent in the summer as well.

I do not think any assistant worth his salt would object to an occasional spell of overtime if the pressure of work demands it, but to be compelled to work for months on end, as is done in some offices I am acquainted with, is neither reasonable nor just, and, so far as I can see, cannot be defended.

Any long spell of overtime is nearly always due to one of two causes—either want of proper organisation on the part of the chief or to the under-staffing of the office.

If it is due to poor organisation, it is rough on the assistant that he should have to suffer for the faults of his chief; and if it is due to under-staffing, for which the chief cannot always be held responsible, it is the duty of the chief to see that his assistants are sweated as little as possible.

That it is sweating there can be no doubt where men are asked to work three or four hours, and on occasion considerably longer, several nights each week, without any payment or return other than a paltry allowance of a shilling for tea, and even this is not always forthcoming. The trades unionist members of our councils are strongly opposed to overtime for their own class, even when paid for as time and a half or double time; and one well-known Labour M.P. within the last few weeks has gone so far as to say that if he had his way he would only pay half-pay for overtime, and that would soon put an end to it. If overtime had to be paid for in the case of officials at the same rate as that paid to artisans, we should get very little overtime worked, for I am sure that any official working his staff overtime under these conditions would find very little favour in his council's eyes, and would be soon told it must stop.

The hardship is particularly severe in the case of the younger assistants, who require all their spare time for working up for the examinations of the Institution of Municipal and County Engineers, the Institution of Civil Engineers, or the various examinations held in connection with our technical schools.

I am sure that in many cases it is only necessary to bring this matter before the heads of departments to effect a great improvement, and I would suggest, Sir, that a tactful letter from the council of the Institution of Municipal and County Engineers expressing the hope that their members would encourage their assistants to sit for their examination and give them an opportunity of obtaining reasonable time for study would bring about a desirable change, even if it is impossible to adopt a system of no overtime.—Yours, &c.,

N. T.

FLOOD HAVOC IN NORFOLK.

COUNTY SURVEYOR'S STATEMENT.

A special meeting of the Norfolk County Council was held on Saturday to consider the situation arising out of the floods. Resolutions were passed sympathising with the sufferers, and authorising immediate steps to repair the damage to the roads and bridges as quickly as possible. An application will be made to the Road Board for assistance to meet the enormous burden cast upon the county, and a deputation was appointed to wait also on the Local Government Board with a view to obtaining sanction for a loan to meet the cost. The county surveyor, Mr. T. H. B. Heslop, presented a report, in which he stated that fifty-two bridges and culverts on the main road had been damaged or destroyed, and he estimated that the cost of repairing and replacing them would be £15,800. He also roughly estimated that the sum of £12,000 would be required to repair the damaged roads. He submitted a scheme for proceeding with the work of repairing at once, and the report was adopted.

Liverpool Waterworks.—The revenue from the Liverpool Corporation water undertaking last year was £374,653, and the expenditure £370,838. The capital expenditure on the waterworks to the end of last year was £6,498,780. The total length of new mains laid during the year in the city and its suburbs was 17,327 yds. Eighty-nine new fire hydrants were fixed during the year, making the total number of fire hydrants in the Liverpool compulsory area 16,044. There still remain in suburban districts 449 of the old fire plugs.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

269. Masonry Arch.—Draw the line of least resistance in a stone segmental arch of 10 ft. span with a rise of 2 ft. 6 in., the voussoirs having an equal thickness of 12 in. and each being equally loaded. (A.M.I.C.E.)

271. Bending Moments.—If a straight prismatic baulk of timber floats in a horizontal position with a weight of 4 cwt. hung to each end, what will be the bending moment at the centre of its length?

REPLIES TO QUESTIONS.

270. Traverse Surveying.—Shortly describe and explain the method of plotting a traverse survey by the method of co-ordinates. ("Surveyor.")

Traverse sheet ..... survey. (Closed) traverse No..... Date.

Point.	Observed angle.	Corrected angle.	Whole ° bearing.	Reduced bearing.	Cardinal points.	Distance.	Difference of latitude. North.	Correction.	Difference of latitude. South.	Correction.	Departure. East.	Correction.	Departure. West.	Correction.	Co-ordinates. N.	Co-ordinates. E.	Point.
	° ′ ″	° ′ ″	° ′ ″	° ′ ″		Feet.											
A			90 0 0												350	350	
B	237 55 0	237 58 0	147 58 0	33 2 0	SE	267			226·3	−·2	141·5	+·4					B
C	283 55 0	283 58 0	251 56 0	71 56 0	SW	250			77·5				237·7	−·7	123·9	491·9	C
D	217 20 0	217 23 0	289 19 0	70 41 0	NW	198	63·5						186·9	−·5	46·4	254·9	D
E	255 45 0	255 48 0	5 7 0	5 7 0	NE	239	238·0	+·1			21·3	+·1			111·9	68·5	E
A	264 50 0	264 53 0	90 0 0	90 0 0	E	230·5					259·5	+·6			350	89·9	A
	1259 45 0	1260 0 0					302·5		303·8		422·3		424·6		350	350	B

Step 1. (Columns 2 and 3.)—The observed angles were the external angles of a closed polygon; therefore they should equal twice the number of right angles as the polygon has sides + 4 right angles. (Euclid.)

$\therefore 1 \times 90 + 360 = 900'' + 360 = 1260$.

Our observed angles are too small, hence a correction must be added.

∴ add 3′ to each observed angle.

Step 2. (Column 4. Whole ° bearing.)—Explanation: Every line in a traverse will have an error; therefore it would not do to plot them from angles and measurements by means of protractor and scale. If we assume some standard direction, it may be true N., magnetic N., or we may choose it so that we may get our survey on the paper, and from this direction we calculate the angle each line makes with it.

This angle is called the bearing.

Measured clockwise right round the circle, they are termed whole circle bearings.

Let us assume AX as our standard direction and that line AB makes an angle of $\alpha°$ with it.

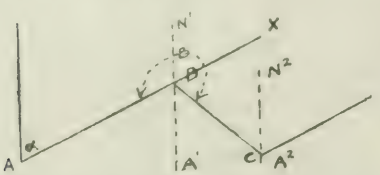

FIG. 1.

Req. ∠ to be added to ∠ bearing of line BC

Let the required angle ABC be β

Produce AB to X

Then $N\hat{B}X$ = a since $A'N'$ is ∥ to AN

$N\hat{B}C = 360 - N\hat{B}X + X\hat{B}A + A\hat{B}C$

Whole ° bearing $+ 360° = \alpha + 180° + \beta$

Whole ° bearing $= \alpha + \beta + 180° - 360°$

$= \alpha + \beta - 180°$

If the angle β was acute, by similar reasoning whole ° bearing $= \alpha + \beta + 180°$

Hence rule to find bearing of any line.

Add bearing of previous line to the included angle (measured clockwise) between the two lines.

If result is more than 180° subtract 180°

.. less .. 180° add 180

.. more .. 360° subtract 360

and if then it is more than 180° subtract 180°

.. .. .. less .. 180° add 180°

Therefore in our example we have assumed bearing of AB = α = 90

∴ α =	90	0′	0″	=	° bearing of AB
β =	237	58	0		
	327	58	0	=	more than 180°
	180	0	0		
α' =	147	58	0	=	° bearing of BC
β' =	283	58	0		
	431	56	0	=	more than 360°
	360	0	0		
	71	56	0	=	less than 180°
	180	0	0		
α'' =	251	56	0	=	° bearing of CD
β'' =	217	23	0		
	469	19	0	=	more than 360°
	360	0	0		
	109	19	0	=	less than 180°
	180	0	3		
α''' =	289	19	0	=	° bearing of DE
β''' =	255	48	0		
	545	7	0	=	more than 360°
	360	0	0		
	185	7	0	=	more than 180°
	180	0	0		
α =	5	7	0	=	° bearing of EA
β''' =	264	53	0		
	270	0	0	=	more than 180°
	180	0	0		
	90	0	0	=	° bearing of AB

This traverse being closed, of course this proves the bearings.

Step 3. (Columns 5 and 6. Reduced bearing.)—The ° bearings are clockwise and must be reduced to their respective quadrants. Take bearing of BC = 147° 58′ 0″. This obviously is in the S.W. quadrant and reduced bearing is the *smallest* angle it makes with our standard direction. (Remember

our ● bearing makes an angle of 147° 58′ 0″ with standard direction.)

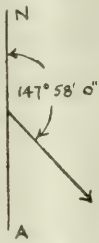

Fig. 2.

Reduced bearing = 180 − 147° 58′ 0″ = 32° 2′ 0″ S.W.
Similarly reduced bearing of CD = 71° 56′ 0″ S.W.

Step 4. (Column 7.)—Fill in distances from field book.

Step 5. (Difference of latitude and departure.)—

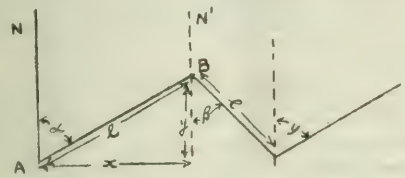

Fig. 3.

Let α be the reduced bearing of AB, whose length is l feet.

Then $x = l \sin \alpha$ = departure = E. or W.
$y = l \cos \alpha$ = latitude = N. or S.

It is best to tabulate these calculations as follows:—

Departure (BC)		Latitude (BC)	
log distance = log 267 =	2·42651	log distance = log 267 =	2·42651
log sin 32° 2′ 0	9·72482	log cosine 32° 2′ 0 =	9·92826
log departure	2·15133	log latitude	2·35477
Antilog = departure =	141·5	Antilog = lat. =	226·3
(CD)		(CD)	
log distance = log 250		log distance = log 250	
log sin 71° 56′ 0 =		log cos 71° 56′ 0 =	
&c.		&c.	

Now we have departure of C = 141·5
" " latitude " C = 226·3

This is SE. therefore under proper headings these figures may be placed

226·3 S
141·5 E

Similarly for all other points.

Since the traverse is a closed polygon
Northings must equal Southings
Eastings " " Westings.

If they do not, a correction must be added or subtracted to make them equal.

This correction should be in proportion to length of line. (The error is probably caused by bad measurement of line.)

Step 6.—To get the traverse on our paper we must arrange the point B in such a manner that all other points fall on. We will therefore take B as

350 N. and 350 E.

Point C is 226·1 S. and 141·9 E.

Therefore it is "less North" than B, therefore the N co-ordinate is 350 − 226·1 = 123·9 N. It is 141·9 E. therefore it is more E than B, therefore the East co-ordinate is 350 + 141·9 = 491·9 E.

Point D is "less North" than C. ∴ subtract 77·5 from 123·9 = 46·4 N co-ord of D.

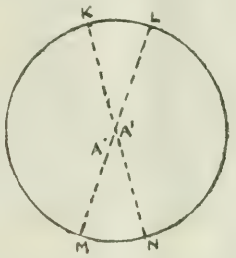
Being W it is less E than C. ∴ subtract 237·0 from 491·9 = 254·9 E, &c.

A piece of drawing paper should be squared to some suitable scale and the points pricked off in the usual way. Join these points up and check them with measured distances. (T. K. *Petworth.*)

Notes.

Your correspondents I. W. S. (Clapham Junction) and W. D. (Dudley) in their answers to Question 266 last week, described in detail just how to approximate the horizontal angle between two stations. The former gentleman assumed the general construction of a theodolite, but did not take into consideration the eccentricity of the centre of the horizontal scale.

It must be borne in mind that to fix the centre of the lower scale is quite an impossibility, therefore to measure an angle over one portion of the scale is simply an approximation.



Let A be the centre of the graduated circle A^1 the axis around which the vernier revolves. For a given angle KA^1L, which is covered by the vernier, will be less when vernier is at KL than it is at MN.

This error is obviated by reading both verniers of instrument and taking mean.

Still there is the possible and very probable error of bad graduation of scale.

To eliminate this the instrument is brought to zero and directed on to station α (say) by the method described the instrument is turned through a certain angle θ_1 and brought of to β (say).

Read both verniers and take mean = ϕ (say). Now bring the instrument back on α with the angle θ_1 as zero and measure angle again. Read both verniers and take mean = ϕ^1 (say). If this method of reading be done three or four times each part of the scale will have been passed over and the mean of all the angles such as ϕ ϕ_1 &c., will be *very approximately* the angle required.

There is also the error caused by personal bias when an observer in bisecting a signal tends either to carry cross-hairs too far or not far enough. To eliminate this always move cross-hairs with tangent screw from right to left in first round and from left to right in second.

This applies also to twisting tripod when moving the instrument.

Other possible errors are bad centre of station and signals not being vertical. These latter errors cannot be eliminated, therefore great precaution is necessary such as taking lowest part of rod visible from instrument. (T. K., *Petworth.*)

THE MONTHLY PREMIUM.

The premium for August is awarded to:—

Mr. H. F. Wilkinson,
Town Hall,
Tottenham.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangement well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney E. Garrett, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bettws-y-Coed U.D.C. (August 27th. Mr. T. C. Ekin).—£9,700 for water supply purposes, including the construction of a reservoir at Elsie Lake, and £3,720 for electric lighting purposes.—Mr. Artemus Jones appeared for the council, and evidence was given by Mr. Evan Evans, the county surveyor, Mr. H. E. Mitchell, electrical engineer, and several ratepayers. The only opposition was from Mr. W. B. Corns, a member of the council.

Cheltenham T.C. (September 3rd. Mr. R. G. Hetherington).—£3,900 for laying wood blocks in the Promenade.—In support of the application it was urged that the present annual cost of maintaining the thoroughfare was £362, and that on the basis of a fifteen years' loan at 3¾ the expenditure of £3,900 on wood blocks would effect a saving, as the annual cost for interest and instalment would amount to £341 only. A provisional contract had been entered into with the Acme Wood Paving Company at £3,526, the company having undertaken to maintain the road in good order for fifteen years.

Feltham U.D.C. (August 20th. Mr. F. H. Tulloch).—£1,250 for the purchase of land in the Bedfont-lane, which, according to the official notice, was required "for a cemetery and other purposes."—The surveyor, Mr. G. Stevens, stated that the depth of the subsoil of the plot to be purchased varied; it was 6 ft. at least in the part which would be used for the cemetery if required. Asked if the council had any idea as to whether it would be necessary to drain inside the site, the surveyor said that it would not be necessary, as the drains outside would suffice.

Hastings T.C. (September 3rd. Mr. F. H. Tulloch).—£2,181 for works of paving in Norman-road, St. Leonards, and Harold-road and Saxon-road, Hastings.—The case for the council was explained by the town clerk (Mr. Ben F. Meadows) and the borough engineer (Mr. P. H. Palmer). It was pointed out that the estimate for Norman-road was £806, and that for Harold-road and Saxon-road £1,375. The town clerk produced a memorial from tradesmen and large ratepayers in Norman-road asking for wood paving to be placed there. There was no opposition.

Headington R.D.C. (August 23rd. Mr. W. O. E. Meade-King).—£2,362 for works of private street improvement.—The surveyor, Mr. A. Walker, stated that the streets affected were at present in a very bad condition. They were fully sewered, and were practically built over. Witness supplied details as to the making of the new roads. The inspector said he had received a letter from a frontager, who asked for the period of repayment to be extended to thirty years. That, of course, the board would not agree to.

Leek U.D.C. (August 30th. Mr. F. H. Tulloch).—£1,050 for acquisition of land as extension to the existing cemetery.—Evidence was given by Mr. Wm. Allen, law clerk, and W. E. Beacham, surveyor, after which the inspector visited the site and inspected trial holes which had been put down. The area was 1a. 3r. 24p., and the addition makes a total area for cemetery purposes of nearly 12 acres, which has served the town since 1856.

Manchester T.C. (August 29th. Mr. F. H. Tulloch).—£5,000 for the provision of baths and wash-houses in St. John's Ward, £2,150 for laying out the New Moston recreation ground, and £2,950 for the purpose of street improvement in Barlow Moor-road and Wilmslow-road, Didsbury.—Mr. Charles Behrens, ex-Lord Mayor of Manchester, in the course of a statement, said there was no district where baths of the kind proposed were more necessary than in St. John's Ward. He understood that in a population of 7,000 people the number of baths to be found in the houses was not more than twenty. Mr. W. Holden, chairman of the Baths Committee, gave evidence in support of the scheme, and proposed that the loan should extend over a period of thirty years. Councillor Chantler said the total investment in the baths of the city was something like £400,000, and the actual charge upon the city rate, which in some districts was 9s. in the £, was under 2d. in the £. The corporation did not carry on the baths with a view to making money out of them. The primary object was the betterment of the citizens from a health and a sanitary point of view. Evidence was also heard with respect to the other applications.

Southport T.C. (August 27th. Mr. F. H. Tulloch).—£6,000 for the substitution of sanitary gullies in place of the existing shallow gullies and catchpits; £3,400 for the purchase of land between Hesketh-road and Park-road for purposes of a recreation ground and street improvements; and £1,800 for the widening of Rose Hill.—The town clerk, Mr. J. E. Jarratt, stated with respect to the loan for sanitary gullies that in a place like Southport it was a great advantage to have such gullies. The inspector: I was wondering if the cartway would be likely to break them. The borough surveyor: Our traffic in Southport is very light, except on the main roads. The inspector (after consulting a section): You have a number of this particular kind already in Southport, and where the traffic is heavy you propose to keep them up with concrete? The borough surveyor: In the new streets they are put in. Lord-street has got them, and the traffic is as heavy in that street as in any, and the tram traffic is heavy. The inspector: You have never had one broken? The borough surveyor: No. The inspector: And you have not used concrete? The borough surveyor: None of them has concrete round them, and none has been broken. The inspector: I think that is all I need. With respect to the purchase of land for a recreation ground, it was stated that the price to be paid worked out at £295 per acre, and as to Rose Hill, it was explained that the widening would be to the extent of 10 ft. and 11 ft.

APPLICATIONS FOR LOANS.

Aghalee R.D.C.—£4,148 for the provision of labourers' houses.

Ashington U.D.C.—£3,080 for laying out Hirst Park.

Brynmawr U.D.C.—£1,100 for the provision of municipal offices.

Hemel Hempstead Joint Hospital Board.—£8,000 for a new isolation hospital.

Kingswood U.D.C.—£750 for a sewerage scheme.

Llandovery R.D.C.—£500 towards the cost of a new bridge.

Plympton R.D.C.—£570 for a water supply scheme.

South Shields T.C.—£500 for a gymnasium and handicraft centre at the high school.

Trowbridge U.D.C.—£16,000 for sewage disposal scheme.

LOANS SANCTIONED.

Chelmsford T.C.—£4,784 for works of street improvement.

Cleckheaton U.D.C.—£847 for alterations and extensions at the public baths.

Finedon U.D.C.—£1,000 for the purchase of the sewage farm.

Gelligaer U.D.C.—£1,700 for the purchase of a site for a cemetery.

Hayes U.D.C.—£1,484 for sewerage and improvement works.

Leek R.D.C.—£6,000 for a sewerage scheme (provisional sanction).

Littleborough U.D.C.—£400 for road improvements.

Queenstown U.D.C. £7,000 for the provision of labourers' dwellings.

Wantage R.D.C.—£400 for water supply purposes.

FORTHCOMING INQUIRIES.

19.—**Sutton Coldfield.** For the provision of a town planning scheme (Mr. Thomas Adams)	
19.—**Swansea.** For the purchase of land for housing purposes (Mr. Edward Leonard)	20.050

Romance of a Large Bookstore.—To have built up the largest business of its kind in the world employing over sixty people, with branches throughout London, and known throughout the world, all this accomplished in the small space of about seven years, by two individuals (who are still mere youths), is an achievement which any man would be proud of. This is the record of Messrs. W. & G. Foyle, of 135 Charing Cross-road, who on Monday opened what will doubtless be the largest and most unique bookshop in the United Kingdom. Commencing about seven years ago with no capital whatever, these two young men (almost boys then) opened a small back-up shop at a London suburb. Soon the latter saw them moving into larger premises at Cecil-court, Charing Cross-road W.C. Not long afterwards Messrs. Foyle again hammered out, and took a lease of a large shop in the Charing Cross-road. Their trade increased by leaps and bounds, branches were opened, warehouses acquired for their greatly increasing stock, and additional offices obtained for the extra staff. Their daily post averaged 1,000 letters, and special mail vans called three times daily for their thousands of parcels. Finding their accommodation again becoming too small, they on Monday opened new premises, in which will be over 20 miles of shelving, and well over 1,000,000 volumes on every conceivable subject on view. So minute is the firm's system of classification that any book can be found within a few minutes. They have also a system by which any books asked for and not in stock can be obtained within a few days.

LECTURES AND DEMONSTRATIONS FOR SANITARY OFFICERS.

The Royal Sanitary Institute announce that their fifty-fourth course of lectures and demonstrations for sanitary officers will commence on Monday, the 16th inst., concluding in November. Part I. of the course comprises four lectures on Elementary Physics and Chemistry in relation to water, soil, air and ventilation, and meteorology, and twenty-one lectures on Public Health Statutes (Orders, Memoranda, and Model By-laws of the Local Government Board and the By-laws in force in the Administrative County of London), The Practical Duties of a Sanitary Inspector—*e.g.*, drawing up notices as to sanitary defects, drain-testing, disinfection, methods of inspection, note-taking, reporting, and elementary statistics, Municipal Hygiene or Hygiene of Communities, including prevention and abatement of nuisances, sanitary defects in and about buildings and their remedies, water supplies, sanitary appliances, drainage, refuse removal and disposal, offensive trades, disinfection, and Building Construction in its Sanitary Relations, Local Physical Conditions, and Measurement and Drawing Plans to Scale. Inspections and demonstrations are arranged in connection with the lectures, and include visits to disinfecting stations, dairy premises, municipal depots, artisans' dwellings, offensive trades, waterworks, common lodging-houses, sanitary works in progress, refuse and sewage disposal works, and other public and private work illustrative of sanitary practice and administration. In some of the visits the students are shown the routine of an inspector's office work and duties.

Seven lectures on Meat and Food Inspection are included in Part II. of the course, full particulars of which can be obtained from the secretary of the institute, Mr. E. White Wallis

STRUCTURAL STEEL FOR BRIDGES AND GENERAL BUILDING CONSTRUCTION.

BRITISH STANDARD SPECIFICATION.

A new edition of the British Standard Specification for Structural Steel for Bridges and General Building Construction (Report No. 15. Revised August, 1912) has recently been issued. The new issue is of importance in view of the fact that the London County Council (General Powers) Act, 1909, requires that all rolled steel used in the construction of skeleton frame work for buildings shall comply with the requirements of this specification.

Since its first issue in June, 1906, the committee from time to time had brought before them points which had arisen in connection with its use, and the present issue embodies the necessary amendments in regard to these. Some of the more important modifications to the specification are as follows:—

(1) The classification of the material dealt with into two categories, A steel and B steel.
(2) The increase of the allowable phosphorus content in B steel from ·07 to ·08 per cent.
(3) The increase of the upper limit of tensile strength for plates, sections and bars (other than rivet bars), from 32 to 33 tons per square inch.
(4) The reduction of the lower limit of tensile strength for rivet bars from 26 to 25 tons per square inch.
(5) The insertion of clauses dealing with—(*a*) Tests by an independent expert, (*b*) rejection after delivery, and (*c*) arbitration in cases where this is not otherwise provided for.

The price of the specification is 5s. 2d., post free, and it may be obtained from any bookseller, or direct from the offices of the committee, 28 Victoria-street, Westminster, S.W., and is published for the committee by Messrs. Crosby Lockwood & Son.

Newcastle Corporation Tramways.—The report of the general manager of the Newcastle City tramways shows that the gross receipts for the year ended March, 1912, were £223,565, as compared with £215,850 for the previous year. The traffic revenue per car-mile worked out at 11·68d., and the total operating costs at £6·375d., compared with 11·15d. and 6·164d. respectively in the previous year. The sum paid towards the relief of the rates for the year was £13,442, and £8,427 is carried to the reserve and renewals account, which now stands at £104,670.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Goole, Glasgow £29,000, Keighley £14,000; housing and town planning—Boston: parks and open spaces—Yarmouth: roads and materials—Glasgow £86,000, West Suffolk £24,000; sewerage and sewage disposal—Belper £10,250, Lisburn £8,000, Tyldesley £13,500; water, gas and electricity—Kirkcaldy £46,800; miscellaneous—Keighley.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Kent C.C.—The county surveyor, Mr. H. P. Maybury, has received authority to consider the interests of the roadmen by (1) establishing a system of small discretionary increases of wages in individual cases of exceptional merit, and (2) by making small allowances to men who, when working some way from home, prefer to cycle back at night rather than to have a lodging near their work.

Liskeard R.D.C.—The roadmen's wages have been increased to 17s. per week.

Mytholmroyd (Yorks) U.D.C.—All the workmen who have been receiving under 22s. per week are to have their wages advanced to 21s. 6d.

BUILDINGS.

Blandford T.C.—The tender of Messrs. Stickland & Son, at £204, has been accepted for the repair and renovation of the municipal buildings.

Chelmsford T.C.—The fire station is to be enlarged at a cost of £193.

Congleton T.C.—A house is to be provided for the town hall keeper at a cost of £282. The borough surveyor, Mr. J. H. Walters, has received instructions to prepare a plan for the extension of the boiler-house at the Forge pumping station.

Cainsborough U.D.C.—The public baths in Lea-road are to be enlarged at a cost of £1,450.

Coole T.C.—Over 70 competitive plans have been received for the proposed new municipal offices, and they have been submitted to the judgment of an assessor.

Glasgow T.C.—A proposal is made by the Washhouses Committee for the provision of swimming, slipper, and Turkish baths at Langside, at an estimated cost of £29,000.

Hatfield R.D.C.—The surveyor, Mr. H. T. Sidwell, has been requested to submit a modified plan for necessary repairs to the municipal stables at Mill Green.

Keighley T.C.—The Institute is to be enlarged at an estimated cost of £14,000, part of which will be paid by the West Riding County Council.

Ludlow T.C.—The question of the acquisition of the assembly rooms for £1,900 is under consideration.

Northwich U.D.C.—The council have accepted the tender of Mr. Thomas Astles, of Northwich, for the erection of new baths, at a cost of £7,850. The work is to be completed in fourteen months.

Rhyl U.D.C.—The decision of the Local Government Board has been received with reference to the application made for sanction to a loan of £7,500 for the purchase of the Rhyl Pier undertaking. The board has deferred sanctioning the loan till the council submit a definite scheme of repair and reconstruction, with an estimate of the cost, and an undertaking that such scheme will be carried out in the event of the Local Government Board giving its sanction.

HOUSING AND TOWN PLANNING.

Boston R.D.C.—Plans have been approved for a number of cottages to be built under the Housing Act. It has also been decided to proceed at once with the erection of two cottages at Benington, and to apply to the Local Government Board for a loan of £340.

Nantyglo and Blaina (Mon.) U.D.C.—The council have approved a recommendation of the Housing Committee that land should be obtained in Bush's field and on the unbuilt portion of Part-street for the erection of seventy-five houses, and that a site should be procured for the erection for the same number of houses in the North Ward.

St. Austell R.D.C.—The question of providing workmen's dwellings under sec. 1 of the Housing and Town Planning Act has been referred to the Plans Committee.

PARKS AND OPEN SPACES.

Evesham T.C.—Arrangements are being made for the extension of the recreation ground by the leasing of land adjoining.

Halifax T.C.—The question has been raised of providing a second bowling green at Shroggs Park. In five weeks, it was mentioned in committee, the existing green had brought in £9 from the fee of 1d. charged.

Llandudno U.D.C.—A sub-committee has been appointed to report upon the suitability of certain land which Lord Mostyn is prepared to lease to the local authority as a golf course.

Withernsea (Yorks) U.D.C.—The council have accepted a gift consisting of 8,000 sq. yds. of land on the sea front between the Pier Towers southwards to Queen's-terrace. The conditions of the gift are that the council within five years make a road from Seaside-road to Pier-road, and in three years make a road across the field to Norfolk House. It is estimated by the surveyor, Mr. J. H. B. Kirton, that the cost will be about £800. The council propose to lay out the grounds in gardens, and, if desirable, build a pavilion and shelter.

Yarmouth T.C.—After refusing the application of the council for a loan of £10,000 for the purchase of 85 acres of land for golf links extension, on the ground that the price appeared to be excessive, and recommending the reopening of negotiations with the vendors, the Local Government Board have intimated their assent to the reduced price of £9,000, which has now been agreed for the land.

ROADS AND MATERIALS.

Aberdeen C.C.—The road surveyor to the Huntly District Committee, Mr. John Allan, has reported upon the destructive effect of the heavy motor traffic on the main roads. Particularly was this the case with the Aberdeen turnpike between Bainshole and Cairnie. Parts of that road had deteriorated so quickly and to such an extent that it was almost impossible at the present rate of maintenance to get them into a proper state of repair. The road was 16½ miles long, and the rate of remetalling would have to be greatly increased if the road was to be kept in a proper state of repair. The roads opposite Broomhill, at Newtongarry Inn, at Ramstone Brae, Shielknowe Quarry, and along the farm of Westerton would all have to be dealt with, as well as various parts in the end of the Cairnie road. He estimated the cost of this work, including maintenance, at £400. Mr. Allan added that early in the year a Morrison's patent scarifier was fitted to the new engine, and it had proved very successful. He hoped to use it extensively this year.

Bolton T.C.—The borough engineer, Mr. E. L. Morgan, has been instructed to proceed with the work of making up Ashbee-street and Garnett-street.

Cheltenham T.C.—A grant of £300 has been received from the Road Board for tar-macadam surfacing on part of London-road.

Calashiels T.C.—The tender of Messrs. Neil, McLeod & Son, Edinburgh, at £2,289, has been accepted for the improvement of Corn Mill-square.

Glasgow T.C.—It has been agreed to construct a new road and bridge from Great Western-road at Botanic Gardens to the end of Queen Margaret-drive through Queen Margaret College grounds, at an estimated cost of £86,000.

Havant U.D.C.—Properties valued at £580 have been purchased for widening the junction of North-street and West-street.

Kent C.C.—The council have approved the undermentioned expenditure on improvements to main roads: Bromley—the laying of artificial stone paving on the main road footpaths, of an area of 1,760 yds. super., at an estimated cost of £463; Southborough—the construction of 125 ft. of footpath on the London-

road, at an estimated cost of £55; Cheriton—formation of a new footpath on the south side of High-street, £90; Hawkhurst—a concrete wall, with iron fence, in front of a pond on the Sandhurst-road, £50; Stone-street—a retaining wall for 60 yds. in front of a roadside pond, £50.

Southmolton R.D.C.—The council have approved the estimate of the surveyor, Mr. W. S. Gardiner, at £266, for improving Leigh-road, Chulmleigh. The estimate includes £56 for tar-macadam.

Taunton R.D.C.—It is announced that the Road Board have promised to contribute to the scheme for the improvement of Priorswood-road at Rowbarton, leading from Cheddon-road to the Bridgwater main road.

West Suffolk C.C.—The improvement scheme on the road, 18 miles in length, leading from Newmarket right through the centre of the county, and which practically joins the counties of Cambridgeshire and East Suffolk, will consist of making up with granite, strengthening the weak sides, and tarring throughout. The cost, £24,000, is to be met by a loan of £19,000, free of interest, from the Road Board, and a contribution of £5,000 from that body.

Wincanton R.D.C. It is expected that a grant will be received from the Road Board for carrying out an improvement at Yenstone, near Templemore. The estimated cost of the work is £2,000, and it is thought the Road Board will contribute half of that sum.

SEWERAGE AND SEWAGE DISPOSAL.

Belper R.D.C.—The work in connection with the scheme of drainage for Crick township, as prepared by the surveyor, Mr. R. C. Cordon, at an estimated cost of £10,250, is shortly to be put in hand.

Berkhampsted R.D.C.—The surveyor, Mr. H. N. Hedges, has had consultations with the medical officer of health with respect to a sewage disposal scheme for the village of Long Marston. He has also been directed to report as to alternative sites for the treatment of the effluent from the Wilstone filters by broad irrigation.

Bulkington (Warwickshire) U.D.C. The Local Government Board have written to the council on the subject of the sanitary defects of the district. The communication stated: "House drains are practically non-existent, and where they do exist are usually the cause of nuisance. The water supply of the district is very unsatisfactory, the well from which the water is derived being liable to pollution from middens in close proximity. It is of extreme importance that measures should at once be taken to safeguard the sources of supply. The board consider that the general sanitary administration of the district would be facilitated by the adoption of up-to-date by-laws as to (*a*) new buildings, (*b*) cleansing of footways and pavements, (*c*) prevention of nuisances, and (*d*) slaughter-houses." The council have decided to consider the Local Government Board's recommendations at a special meeting.

Chapel-en-le-Frith R.D.C.—The tender of Mr. M. A. Boswell, Wolverhampton, at £8,990, has been provisionally accepted for works of sewerage.

Dunmow R.D.C. A site for sewage disposal works has been purchased for £450.

Isle of Wight R.D.C. A sum of £483 is to be spent on sewerage and outfall works.

Lisburn (Co. Antrim) R.D.C.—The Balmoral sewerage scheme as amended is estimated at £8,000, which shows a saving in the cost of construction of the outfall sewer of £3,900. Messrs. Swiney & Croasdaile are the engineers.

Settle R.D.C.—A scheme of sewerage and sewage disposal for Airton has been adopted, the estimated cost being £1,100.

Tipton U.D.C.—The tender of Messrs. Thompson & Farley, Kidderminster, at £5,696, has been accepted for carrying out the sewage disposal scheme.

Tyldesley U.D.C.—A scheme has been approved for the construction of a main outfall sewer, at an estimated cost of £13,500.

WATER, GAS, AND ELECTRICITY.

Belfast T.C. In connection with the scheme inaugurated some time ago for the better lighting of the streets a further step forward has been taken by the extension of the electrical system to leading thoroughfares.

Chapel-en-le-Frith R.D.C.—The tender of Messrs. Eadie & Co., at £3,972, has been accepted for the construction of a new reservoir at Dove Holes.

Chelmsford R.D.C.—The engineer, Mr. J. Dewhirst, has been instructed to submit an amended scheme for a water supply for Broomfield.

Dundee T.C.—The completion of the scheme for the raising of the level of Lintrathen Loch, from which Dundee gets its water supply, was reported at a meeting of the Water Committee recently. Mr. George Baxter, the water engineer, estimated the cost of the new works at £15,000, and these had been completed at a cost of £12,481. The construction of a new road had cost £1,248, and miscellaneous expenses £900.

Guisborough R.D.C.—A water supply improvement scheme is to be carried out at Newton-Mount-Kennedy.

Hinckley U.D.C.—New water mains are to be laid, at a cost of £212, and the tender of the Holwell Iron Company, at £6 9s. per ton, has been accepted for the work.

Kirkcaldy T.C.—A scheme is under consideration for the extension of the gasworks, at an estimated cost of £46,800.

Street U.D.C.—The surveyor, Mr. H. Cousins, has been instructed to carry out test borings down to the rock surface under the peat and clay.

Ticehurst (Sussex) R.D.C.—A committee has been appointed to consider an offer by the local water company for the purchase of the undertaking by the council.

Tipton U.D.C.—Extensions at the gasworks are to be carried out as follows: Vertical retorts, West's Gas Improvement Company, Manchester, £9,700; scrubber, Messrs. R. & J. Dempster, Manchester, £440; engine and exhausters, Messrs. Dempster, £235.

MISCELLANEOUS.

Beccles T.C.—The council have accepted the gift of a steam fire engine from Mr. W. Garrod, sen.

Brierley Hill U.D.C. Land to the value of £6,500 is to be purchased for a cemetery, subject to the sanction of the Local Government Board.

Keighley T.C.—The Tramways Committee have been authorised to prepare a scheme for a system of trackless trolley vehicles between the tramways terminus at Ingrow and the junction of Haworth-road and Hebden-road, and to obtain tenders for the necessary equipment. It was stated that the committee had decided on this route because it was a rather steep gradient, and they knew exactly what the revenue was. They had no fear regarding the possibility of loss.—From the statement of accounts in respect of the tramways and the motor-buses for the year ended March 31st, it appears that there has been a profit on the tramways of a little over £1,100, and a loss on the motor-buses of £2 437.

Manchester T.C.—The council on Wednesday last were almost unanimous in placing a £10,000 contract for tramway points and crossings with an American firm whose quotation was £800 below the tender of a Sheffield company. It was stated that the American goods would be equal in quality to the English, and that delivery would be made quicker.

DEPUTY CITY SURVEYOR FOR MANCHESTER.

The Manchester City Council on Wednesday last approved the recommendation of the Town Hall Committee to appoint a deputy city surveyor, at a salary of £500 a year.

The Virtues of a Water Supply.—In a letter of thanks to the Wigton Rural District Council, which was read at a meeting on Tuesday, an agriculturist of the district ascribed to the new water supply extraordinary virtues. The water, he declared, caused a saving in both tea and soap, and the same thing occurred in the matter of whisky, for the water was so pure that there was no necessity to d intect it with spirits. Public bodies, he added, received too few thanks for the many benefits they from time to time conferred on struggling humanity. The clerk said it was the first letter of thanks he had ever read to the council.

PERSONAL.

Mr. D. Hinchcliffe, surveyor and inspector to the Shepton Mallet Urban District Council, has had his salary increased by £40 a year.

Mr. S. G. Bloy, surveyor to the Mutford and Lothingland Rural District Council, has had the misfortune to strain his leg and thigh somewhat seriously while on duty.

Mr. William Tuke Robson, chief assistant engineer in the Hull Corporation tramways department, was on Wednesday appointed manager of the South Shields tramways, at a salary of £300 a year. There were fifty-three applicants.

Mr. A. W. Priest, in the employment of the Rushden Urban District Council, and formerly for twelve years in the service of the Corporation of Wolverhampton, has been appointed general foreman to the Teddington Urban District Council, at a salary of £104, rising to £120.

Mr. Wilfred H. Veal, pupil of Mr. John S. Walton, the borough engineer of Falmouth, was, at the Royal Cornwall Polytechnic Exhibition, held at Falmouth during the week commencing August 26th, awarded a first-class bronze medal for his plans of a villa and survey of a building site, the judges stating that his plans had been executed with great care, and that the precision of the plans disclosed general ability. In March last Mr. Veal passed the examination of the Surveyors' Institution, qualifying for a Professional Associate.

Mr. J. T. Child, the city engineer of Calgary, hails from England, where he served his articles with Messrs. Hopkins, Gilkes & Co., general iron manufacturers and constructional engineers, of Middlesbrough, and was afterwards for two years on the Ordnance Survey. He went to Canada in 1883, and had varied engineering experiences, which led up to his being consulted, in 1908, upon the question of bringing water to Calgary by gravitation, to relieve the ever-increasing cost of pumping. In that year he designed and partly constructed the Calgary gravity water supply system, and was, in 1909, appointed to his present office. He is a member of the Canadian Society of Civil Engineers.

"FERROMAC" ROAD CONSTRUCTION.

Roadite, Limited, 9 Great George-street, Westminster, London, S.W., patentees of the "Ferromac" system of road construction, held a demonstration of their process recently at Fisherton-de-la-Mere, near Wylye, Wiltshire, on the road they are laying for Mr. J. George Powell, the county surveyor. Among the surveyors present were Messrs. R. Giddings, surveyor to the Bradford-on-Avon Rural District Council; — Hancock, surveyor to the Warminster Rural District Council; F. Jones, borough surveyor, Frome; F. G. Billingham, borough surveyor, Devizes; S. W. Saunders, surveyor to the Devizes Rural District Council; J. T. Huxham, of Amesbury; A. F. Long, of Warminster; and H. Skelton, of Bemerton, Salisbury. All seemed much interested in the process.

Torquay Pavilion.—Mr. Henry A. Garrett, Assoc.M. Inst.C.E., the borough engineer and surveyor, writing with reference to the description given in our issue of the 23rd ult. of the new pavilion at Torquay, asks us to state that the roof of the building is externally covered with copper, this alone having cost nearly £2,000, and that the internal oakwork is in an Austrian wood.

Oxfordshire Roads. The total cost of Oxfordshire's urban main roads has been £6,189, a decrease of £426 compared with the previous year, which is partly due to the transfer of Caversham to Reading. The rural main roads show a total cost of £28,741, an increase of £444. After allowing for the money received for repairing roads over railway bridges, restoration of damage to roads, and fees for motor cars and locomotives, amounting to £1,165, the nett expenditure on the rural roads has been £27,575, or £61 12s. a mile, as compared with the total in the previous year of £27,015.

WARRINGTON BOROUGH ENGINEER'S DEATH.

Mr. Thomas Longdin, borough engineer and surveyor of Warrington, died suddenly in his office on Wednesday morning. He was at business at the usual hour, apparently in good health, but while engaged in conversation with the deputy town clerk (Mr. A. T. Hallaway) suddenly fell forward in his chair and expired a few minutes afterwards.

Mr. Longdin, who had been in the service of the corporation for thirty-four years, was sixty-five years of age.

FOR OTHER ADVERTISEMENTS

See End of Paper.

DRAUGHTSMAN required for the Public Works Department of Sierra Leone for two tours, each of 12 months' residential service with possible extension. Age between 25 and 35, preferably unmarried. Strict medical examination and vaccination if necessary.

Salary £300 a year, rising to £350 by annual increments of £10. Free single quarters provided at established stations. Free first-class passage out and home again on satisfactory termination of engagement. Half salary on voyage out, full salary from date of arrival in the Colony.

Two months' leave on full pay after 12 months' tour, increased to four months' if returning to the Colony, with full pay during voyage or voyages and free passages. Candidates should have had considerable experience in architectural and engineering draughting, and should have held a responsible position in the drawing office of an Architect and Surveyor, or Civil Engineer in good general practice. They should be neat and expeditious draughtsmen, capable of taking levels and making surveys for buildings, bridges and other works. They should also have had experience in the control of a drawing office staff, and be capable of getting out designs and details of buildings—including steel frame work—bridges and other works, with some experience in architectural design. They should be well up in building construction, and the preparation of specifications, bills of quantities, and estimates, and preference will be given to those applicants who have served articles with an Architect and Surveyor, or Civil Engineer with a practice in constructional work, and, other things being equal, to candidates who have passed the examination of the Surveyors' Institute (Building Subdivision), or the Institute of Municipal and County Engineers.

Application by letter (no special form required), stating age, whether married or single, giving full particulars of experience, accompanied by copies of testimonials (not originals), with names and addresses of referees of whom inquiries can be made as to capabilities and character, should be sent as soon as possible to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

Quote M 5537 on left-hand top corner of application.

HANWELL URBAN DISTRICT COUNCIL. The above Council are prepared to receive Tenders for the Supply of—

1. Broken Guernsey Granite.
2. Kentish Pit Flints.
3. Distilled Tar.

Forms of Tender and further particulars may be obtained on application at the Council Offices, Hanwell.

Tenders to be delivered to the undersigned not later than the 23rd September, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

Any person, firm, or company canvassing any Member of the Council will be disqualified for receiving orders or contracts from the Council.

(By order)

PERCY SCOTT,
Clerk to the Council.

Council Offices,
Hanwell, W.
September, 1912.

WANTED, immediately, a Temporary Assistant in a Surveyor's Office in North-West District. Must have had good Municipal experience; salary £2 2s. per week.—Reply, enclosing copies of testimonials, &c., and earliest date could enter upon duties to Box 1,183, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

Royal Sanitary Institute Congress at York.

ENGINEERING AND ARCHITECTURE SECTION.

Among the papers which came up for consideration at the first sitting of the Engineering and Architecture Section of the York Congress of the Royal Sanitary Institute was the following:—

COUNTRY HOUSE SEWAGE PURIFICATION.

By JOHN E. TUKE.

When we come to consider the question of a suitable installation for a small hamlet or isolated country house, whether large or small, we have special factors which have to be taken into account. Some of these special considerations are worthy of discussion.

The question of site is the one which has naturally to be considered first, and it is evident that the range of choice must be very considerably limited. While it should be borne in mind that the installation should be situated as far as possible from the house or houses on the one hand, or from a public highway on the other, this will have to be governed by the question of levels, and the possibilities of final outfall for the purified effluent, and it may be taken as an axiom that, unless lifting by some means is feasible, it is not possible to obtain satisfactory results with an available fall of less than 5 ft. from the invert of the incoming drain or sewer to the final outfall, unless in some exceptional instances the nature of the subsoil is capable of providing free soakage, as, for example, on gravel or chalk.

This limitation of site makes it essential that special steps be taken to ensure against offence from the sewage works to either eyes or nose.

AERIAL NUISANCE.

The claim is often made that a properly designed sewage disposal plant should not smell, but it has been pointed out by an eminent member of this institution that, for some reason at present not fully understood, a sewage installation may be free from smell for 360 days in the year, and yet be a source of offence on the remaining five days. It has often been noticed that such occasional aërial nuisance is specially evident before rain, and the explanation, in my opinion, is that a sudden fall in the barometric pressure draws out the naturally foul air from the interstices of the filter-beds, and the probable humidity of the atmosphere inclines to aggravate the tendency to smell. Thus it is obvious that special provision must often be made in connection with these small schemes for screening, and for reducing the possibilities of air pollution.

In practice I have found that the ordinary ferro-concrete or wooden covers to the tanks in most cases, with shallow trays, formed of small mesh expanded metal filled with a layer of peat-moss litter over the filter-beds, is sufficient to overcome this difficulty. It might be pointed out, however, that these trays should be above the discharge pipe from the tanks, so as to check the free passage of foul air from the tank when a sudden increase in the rate of flow of the incoming sewage takes place.

The second point upon which I would suggest discussion is the question of increased tendency to smell, caused by the relative septic condition of the tank effluent. The idea that septic action was to solve the sludge problem of the sewage engineer has long been exploded, and the finding of the Royal Commission on Sewage Disposal that septic action, *per se*, is not necessary for the satisfactory aërobic treatment of the tank effluent has still further modified the theory, so that the municipal sewage engineer has frankly re-christened his septic tanks "sedimentation tanks," and has to lay himself out to deal practically with the full initial volume of solid matter by manual or mechanical means.

The absence of regular attendants, and the impracticability of installing sludge lifting and pressing plant for a small installation renders it necessary to try to devise some alternative method.

I believe that the hydrolytic tank of Dr. Travis in England, the Emscher or Dortmund tanks in Germany, and the modification of these as designed, I think, by Mr. Aird Murray, of Canada, at the Lethbridge works, point the way in which this modification should be sought, for in such a tank the liquid sewage, which constitutes, I suppose, roughly 95 per cent of the total volume, can be treated in an aseptic condition, while septic action may be utilised for its sole useful function of breaking down and digesting the solid portions, so as to render them more capable of being attacked in the filter-bed or removed from the tank.

I have found in a large number of cases that a tank formed somewhat on these lines, which perhaps may be called a semi-septic tank, is capable of discharging to the filter-beds an emulsified effluent containing a considerable proportion of the solid matter in suspension, and collecting a thick scum of irreducible fibrous particles at the top, with a very slight deposit of sludge at the bottom of the tank. The capacity of such a tank in relation to the average daily flow is one which requires some consideration, as, in my opinion, it should be as small as possible, consistent with an adequate scum-forming capacity, so as to require as infrequent attention as possible, and the depth should be great in relation to its area. It will be seen from what I have already said that personally I am in favour, in the small installations which have not the advantage of regular attention, of passing to the filter-bed as large a proportion of solid matter as is possible, in contradistinction to the practice of the municipal engineer who prefers to keep back his solids and deal with them in bulk, and to take a very weak effluent on to his percolating filters.

I believe it will be found much easier occasionally to change the material of the upper portion of the filter-bed than to increase the quantity of solid matter which has to be removed from the liquefaction tank.

DISTRIBUTION.

This brings me to another point on which I should like to suggest some thoughts—*viz.*, the effective distribution of the stronger tank effluent on to the filter-bed surface. There is no doubt in my mind that efficient distribution and aëration are the most important factors in securing a non-putrescible effluent. Forms of distribution which may be perfectly satisfactory on large beds with weak sewage and in isolated positions are quite impossible on the small beds and with the greatest need for avoidance of air pollution, and with the different character of the effluent from the type of tank I have recommended.

No form of perforated pipe distribution should be allowed on account of the constant liability to choke, neither can small rotary contributors dependent for their movement upon the reactionary pressure of the outflow be relied on, and fixed sprays, even if sufficient head is available, are liable to cause some smell, although they possess the advantage of increased aëration if they can be used in isolated places.

An upward water-logged filter cannot by any possibility be more than a mechanical strainer, and this might be more easily arranged by means of fine wire screens. The provision of a filter-bed which depends for its distribution on the overflowing of a series of ducts or channels, which, although originally fixed level, never remain so, results in the sewage short circuiting through the bed in two or three places and is more or less useless.

I have found that the most satisfactory method of distribution is by means of a series of serrated edged channels or troughs, which may be fed intermittently by means of either an oscillating tipper, or from a dosing syphon, or, better still, may be made to revolve or travel over the surface of the bed by mechanical or hydraulic pressure. There is another small point which should be considered in relation to small sewage installations, which is of little moment in connection with a public sewerage scheme, and that is the provision of suitable grease traps. Grease or fat is the slowest substance to be affected by aërobic bacterial action, and tends to clog the interstices of a filter-bed and prevent the liquefaction process in a septic or semi-septic tank. Hence the flushing-rim grease trap, which, excellent as it may be when it is desired easily to discharge all such matter from a kitchen sink into a public sewer, is not suitable with a private sewage installation, and a large capacity trap, preferably of 20 or 25 gallons, so as to avoid the necessity of too frequent attention, should be used; this should be fitted with properly constructed dirt basket or scoop, and cleaned out at least once a fortnight. This will make considerable difference to the efficient working of the sewage purifi-

cation plant, and lessen the chance of smell from the installation.

USE OF DISINFECTANTS.

Another point which should be noticed is that great care should be taken with the use of disinfectants. These are freely used nowadays in houses connected to public sewers, and yet the volume is not sufficient to interfere with the municipal sewage works, but the writer has frequently found the bacterial action of a small installation entirely suspended and the tanks and filter-beds rendered practically sterile by this means. If infection from the effluent be feared, then disinfect after purification and not before, or else it is probable that the purification will not take place at all.

COST.

A word or two may be said in comparison of the relative cost of installing and maintaining a municipal as against a private installation. I think it may be fairly assumed that the capital expenditure charges are about 30s. to 40s. per head of the population dealt with in the former case, as against £4 to £5 per head from a private installation. The relative figures as to maintenance may roughly be put at from 7d. to 1s., as against 1s. 6d. to 2s., per annum. If the initial cost of a private installation seems high, it must be remembered that in many country districts the only alternative is the old cesspool system, with its constant expense and danger to health, and fortunately the builders of country houses are gradually being educated up to realising that an expenditure for this purpose is a wise one, but it is somewhat curious to note how much further advanced is the thought on this really important question in the South and West of the country, as against the Midlands and Eastern counties and the North. This may be partly accounted for by natural causes, and the distribution of the larger centres of population and the larger number of upper middle-class people who build country residences in the Southern counties, but it is to be hoped that the time will soon come, which has been foreshadowed by the President of the Local Government Board, when all the rivers and streams in the country will be under a Rivers Board.

DISCUSSION OF MR. TUKE'S PAPER.

Mr. W. Kaye Parry (Dublin) said he had been associated with the question of sewage purification for a great many years, and there was one observation he desired to make on the whole subject, so far as it related to country houses and isolated institutions, and that was that the younger men there would perhaps learn something by looking back and seeing how the question was handled by early reformers in sewage purification. In his early days Mr. Rogers Field, Mr. Bailey Denton and others dealt very successfully indeed with the sewage treatment of country houses, and many of the installations which they put in were excellent models, which could even be followed with advantage at present. They believed as he believed then, and did still, that sewage purification could be dealt with in a country house without putrefaction, for the reason that the sewage came down within three or four minutes from the time it entered the drain. What Mr. Rogers Field did was very simple. He screened out the solid matter as well as he could, and he allowed the liquid, which at that period was inoffensive, to flow over the land where the land was suitable. Mr. Bailey Denton put it through a process of intermittent filtration, which was really the [illegible] although he [illegible] Most excellent installations were carried out, and were working well at the present day. Twenty-five years ago he himself installed a system on a large estate. The sewage was screened and the liquid was put on the land and was still being put on the land. From that day to [illegible] he never [illegible] a good many of these cases under the septic tank heresy, [illegible] was that they could not really sewage without putrefying it first. In one case the sewage was pumped before it reached the works, but he was satisfied that the question of the pumping or not pumping had practically nothing [illegible] to deal with the liquid when it came there. They [illegible] put the tank before they had any [illegible] which they could run into the earth and put on the ground with the greatest possible advantage. [illegible] that was done by the liquid [illegible] and that was impossible in [illegible] He [illegible] bitten with the septic tank heresy, as he thought it must be right, but he tried it, and had never been half so successful as with the earlier work he did, and he was inclined in his old age to go back to the lines on which he started work. He thought that to a large extent Mr. Tuke was with him.

Dr. Tempest Anderson said he considered that trouble arose because the whole system of sewage treatment was wrong in theory, and possibly because it had been forced upon the world by practice. In the large towns it was impossible to use any other system, but the difficulties increased in proportion to the size of the installations put in. But to put these installations in small villages seemed to him absolutely repugnant, and if the same ingenuity had been expended in getting the manure on the land the results would have been fifty times better. He supposed, however, that sanitary engineers found it more profitable to put in large installations on which they got a large commission.

Mr. Costain (Great Crosby) said he well remembered attending a congress where Dr. Cameron introduced the septic tank theory, which it was expected would create a new heaven on earth. He did not think it had done all that was expected of it, but for a large country house, or for a number of smaller houses, he considered an adaptation of the septic tank principle absolutely superior to the system described by Mr. Kaye Parry. The solid matter required very constant dealing with, and it was not possible to get it satisfactorily dealt with. By the septic tank and subsequent filtration they got a liquid matter which could be easily dealt with, while the solid matter could be dealt with once in six months.

Mr. Burleigh (York), as an architect, thought local authorities were making a big mistake in insisting on water-closets in country districts, and having large sewage works which entailed a lot of money. Dr. Poore had told them that in Holland they had no water-closets, and the Dutch were not a weakly lot of people, but, on the contrary, were very energetic, and were able to export a lot of foodstuff, because they took advantage of natural conditions, and used the manure for the land instead of throwing it into the sea.

Mr. Fairbank remarked that with a properly designed sedimentation tank of not too large a size, and with large, coarse clinker and a fine and regular distribution over it, there should be no nuisance with a small installation for a house of ten or fifteen people.

Mr. Tuke said that, while agreeing with Mr. Kaye Parry as to dealing with the liquid when fresh and sweet, he thought it was impossible to arrange for the screening out of the solids for a small house or hamlet. With regard to manurial value, would not efficient treatment in a tank such as the last speaker suggested give a liquid possessing even more fertilising value than crude sewage?

(To be continued.)

Ilkeston Sewage Disposal Works.—We are informed by the town clerk, Mr. Sidney F. James, that, owing to the indisposition of the mayor (Councillor Samuel Shaw), the opening of these works, originally fixed for the 11th inst., has been postponed to October 2nd, at 3.30 p.m.

Rural Council and War Office.—A dispute has arisen between the Chertsey Rural District Council and the War Office with respect to the right of the former to take gravel from Chobham Common for the repair of the roads in the neighbourhood. It appeared that, at the suggestion of the War Office, the council had given up making use of the Folly pit because it was in the line of fire of the Bisley competitions, and that the War Office had attempted to enforce a charge for the use of the Redhill pit. The council recently agreed to the terms of a letter to the War Office, in which it is argued that whether the Crown is or is not bound by the Highways Act of 1835 does not seem to be material to the point in question, because there is a title in the surveyors of highways (that is, the council) by prescription to dig gravel for the requirements of Chobham parish roads at any place on the whole of the common to which they may wish to resort. This right has been exercised continuously for an exceedingly long period without interruption. It could not be said that the rights of the owner had been dredged by the operations being confined to the Folly. There was no likelihood or reason for the surveyor to dig from any part of the common but the Folly, and the gravel in the pit for the time being in use exhausted or unsuitable or difficult to procure.

SOME RECENT PUBLICATIONS.*

Taxation of Land Values as it affects Landowners and Others. By John Orr, M.A. Price 1s. nett. London: P. S. King & Son.

In this little book there has been put forward a higher claim for taxation of land values than any that has been heard in recent controversy. We have been frequently told of the benefits which Labour and Capital would derive from this policy, but, taking the scope and progress of the reform as its advocates depict them, the author here attempts to show that substantial benefits would accrue to the landed classes. This statement is paradoxical to most of us who have been diligently taught that the landlord would be hit hard and hit justly by this scheme. The idea, however, has the merit of not being absolutely new. Quotations from the economists of the eighteenth and nineteenth centuries, and inferences from the effects of the system as established in the colonies, are urged to support the writer's argument that this proposed reform in taxation, far from being simply a class war cry, fulfils the highest demand of statesmanship, in being beneficial to every class. The subject thus gains by being removed from party conflict to the clear air of unbiassed inquiry. Further measures of the land policy introduced in the Budget of 1909 have been promised, and there is a proposal to carry out a reform of the rating system on the single tax basis. It is being asked what this extreme step means, what effects it will produce, and that is the question discussed in this book. Ricardo's definition of rent is shown to be quite inadequate, and a new definition is given. The chapters on Value and on the Principle of Political Economy are interesting in the light of the present labour troubles. In the development of the theory of taxation adopted here the author has gone a long way towards reconstructing the foundations of Political Economy. He bases his arguments largely on some used by Adam Smith and Turgot, and it will be interesting to see how his work stands the criticism of different economists. The book raises in a clear and definite way points that are ripe for discussion in the light of immediate problems in taxation.

Hunt's Law of Boundaries, Walls and Fences. Sixth edition. Revised and substantially rewritten by R. G. Nicholson Combe, M.A., LL.M. Price 15s. London: Butterworth & Co.

Although this book is evidently intended primarily for the legal practitioner, many of the matters dealt with belong to those branches of the law of which the surveyor requires considerable knowledge in his daily practice. For example, the law relating to the right of support for land and buildings, the law of party walls, and the law as it affects the boundaries of highways, are each discussed in separate chapters. The arrangement of the book is exceedingly convenient for the lay reader, inasmuch as the numerous references to decided cases are relegated to footnotes, the text comprising the principles of law which can be deduced from them. The aim of the book is stated to be to furnish the reader with an exposition of the main principles of law which are generally material in the solution of the question of the whereabouts of a boundary, and of the question of the rights and obligations of neighbours in respect of a boundary. This aim has been well achieved, in spite of the difficulty which confronted the author because of the vague character of the limits of the field of his own subject; and surveyors will find, *inter alia*, the topics enumerated above treated in a learned yet clear and concise manner.

Reference-book for Statical Calculations. By Francis Ruff. Price 4s. nett. London: Constable & Co., Limited.

This exceedingly useful little book, which was originally written in German cloth in Germany and in France it has met with great success, now appears in an English translation by the author. Its aim is to enable engineers and others to carry out any desired statical calculation with ease and rapidity. This is attained by giving for every case dealt with a frame and stress diagram, together with a short description showing how the latter has been drawn. The procedure is followed as regards beams and girders, lodge trusses, strut frames, roofs, cantilevers, open web girders, curved beams, suspension bridges, framework columns, earth pressure, retaining walls, and concrete structures. The notation used is very convenient, and the use of Mr. Ruff's work will undoubtedly save the busy practitioner a great deal of time and trouble, as it is not always easy to find in a large text-book just the information which may be wanted for the calculations required in any given cases. Some very useful tables are added at the end of the work, the whole of which is designed to save labour.

Stresses and Strains. By F. R. Farrow, F.R.I.B.A., Price 5s. nett. London: Whittaker & Co.

This work, a second edition of which has just appeared, deals with the various problems of stress and strain which are likely to be of use to the architectural student. The author, who, by the way, has had a large experience in the tuition of architectural students, assumes the very minimum of mathematical knowledge and skill on the part of his readers. The calculations of beams, girders, stanchions, arches, retaining walls, and so forth are treated both graphically and mathematically, and the text is elucidated throughout by an excellent series of worked examples. The several formulæ are collected into a useful list, while the book is completed by a series of tables of the strength of materials and other data useful in making calculations. Well indexed and copiously illustrated with clearly drawn diagrams, this work should prove exceptionally valuable to the architectural student who does not need the more advanced treatment of the subject which is usually to be found in text-books on applied mechanics, materials, or the theory of structures.

The Law relating to Tithe Rent-charge and other Payments in lieu of Tithe. By P. W. Millard, LL.B. Price 4s. 6d. nett. London: Butterworth & Co. and Shaw & Sons.

Although tithes, properly so called, are almost extinct in England and Wales, most land is subject to tithe rent-charge, corn rent, or some other payment in lieu of tithe, and estate agents and surveyors being daily concerned with real property need to know a good deal of the law relating to this subject. Mr. Millard, who is the assistant head of the Tithe and Copyhold Branch of the Board of Agriculture, is a most efficient guide through a somewhat complex field of law. He has dealt with his subject in a clear and practical manner, and each of the thirteen chapters into which the book is divided is concerned with a definite topic. The Tithe Act, together with the rules and forms thereunder, are set out in full in an appendix, and all the decided cases are noted in the text. Mr. Millard's work forms an up-to-date and clear exposition of the law in a consolidated and easily accessible form.

Local Government Case Law, 1911. By R. A. Glen, M.A., LL.B., Barrister-at-Law. Price 7s. 6d. nett. London: "The Local Government Review," Ltd.

This is the second annual volume of "Local Government Case Law" issued by the *Local Government Review*, and the name of its author is sufficient guarantee of the care and accuracy which are necessary in such a compilation. It is exceedingly copious, and contains digests of over 450 cases. The table of cases and index include the cases digested in the first volume, thus much facilitating reference. The digests are grouped under fourteen headings, many of which are of special interest to municipal engineers and surveyors—*e.g.*, Contracts and Compulsory Purchase (forty-six cases), Highways, &c. (fifty-six cases), Public Health, Sewerage and Drainage (twenty-five cases), and Water, Gas and Electricity (twenty-three cases). We know of no other single volume in which so complete a digest of local government case law can be found conveniently and carefully arranged and indexed for easy reference.

The Land Union's Hand-book on Provisional Valuations. Price 3s. nett. London: Vacher & Sons, Limited.

This hand-book is designed to assist owners of land and house property in dealing with valuations under the Finance (1909-10) Act, 1910, as amended by the Revenue Act, 1911. It is not intended as a technical legal hand-book, but it states as simply as possible the main features which property owners ought to understand, and the direction in which they should move if they desire to protect their interests. The object of the Land Union in issuing the book is to give such hints as may be conducive to the protection of the interests of those who are liable to pay the duties and who have not the leisure at their disposal to study the Act in detail or to peruse more technical legal works.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

NEW STREETS AND BUILDINGS.

REVISION OF OBSOLETE BY-LAWS.

A circular relating to by-laws as to new streets and buildings has been issued to district councils by the Local Government Board. The circular points out that in the existing by-laws the ordinary clauses for the laying out of roads do not permit some of the classes of roadway which have been designed in some "garden cities," or the exceptional arrangements which are demanded in certain cases by the configuration of the ground.

Local authorities have from time to time applied to the board for approval of by-laws appropriate to such conditions or circumstances. Other local authorities have obtained express statutory powers with similar objects in view, but there are many in whose districts by-laws have been in force practically unaltered over a long period of years, by-laws which were framed before the modern methods and materials came into vogue, and consequently are not so drawn as to allow or to regulate their use. It therefore behoves all local authorities from time to time to consider the terms of the by-laws in force in their areas, so as to see that they are sufficient to meet present-day requirements. The board will be happy to render assistance to any authorities who may desire to modify their existing by-laws by referring them to clauses which have been embodied in series already adopted or by such other suggestions as may be practicable.

It is recognised that in many parts of the country, and particularly in rural areas, there is great need for better cottage accommodation, and rural district councils should be careful to see that the requirements of their by-laws, while prescribing conditions essential to health, are not such as to offer any impediment to the erection of suitable dwellings. There are some rural districts in which a code of by-laws based on the board's original Model series, which was drawn up with special reference to urban areas, is still in force. These codes are not only more stringent than the board would at the present day consider necessary in a rural area, but are not relieved by the relaxations and modifications which have been embodied in the latest Model code for urban districts with a view not only of meeting special difficulties, but of securing greater flexibility in the administration of the by-laws. The councils of these districts should take the matter into early consideration and see whether a less exacting series of by-laws would not meet the reasonable requirements of their area.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

FORTHCOMING DISTRICT MEETINGS.

Eastern District meeting at Grays, September 21st or 28th.

East Midland District meeting at Ilkeston, September 28th.

Eastern District meeting at Gerrard's Cross, April 26th, 1913.

A meeting which had been arranged for September 13th and 14th at Wrexham has been postponed.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

ANNUAL MEETING.

The annual meeting will be held in London in October.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. John D. Watson, M.Inst.C.E., F.R.S.I.

MEETING AT SALFORD SEWAGE WORKS.

To-morrow (Saturday) a visit will be paid by the members of the Association of Managers of Sewage Disposal Works to the works of the Salford Corporation in Borough-road, Weaste, the points of interest in the installation being screening chambers, detritus tanks, roughing filters with special cleansing machinery, final percolating filters with fixed sprinklers, automatic samplers, double-acting plunger and centrifugal pumps of 40,000,000 daily capacity, chemical mixing machinery, Tangye sludge pumps for loading the steamship "Salford," clinker crushing machinery, and media washing and grading machinery.

Programme.

3 p.m.—Meet at sewage works, when members will be received by Mr. Councillor Mather (chairman) and the members of the river Irwell Conservancy Committee. The Mayor of Salford (Alderman H. Linsley, J.P.) will be present later in the afternoon.

Paper, descriptive of the works, will be read by Mr. J. Corbett, borough engineer and surveyor.

View the works under the guidance of the borough engineer, and the manager, Mr. W. H. Duckworth, F.C.S.

Tea at the sewage works, at the invitation of his Worship the Mayor, the chairman, and members of the River Conservancy Committee.

The meeting arranged to be held at Ramsbottom tomorrow has been cancelled.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE, WEST HAM: PRELIMINARY NOTICE.

The annual conference of the Municipal Tramways Association (Incorporated) will be held in West Ham on September 25th, 26th and 27th next. De Keyser's Hotel, Victoria Embankment, E.C., has been selected as headquarters for delegates, and the following programme has been arranged:—

September 25th.

10.15 a.m.—Reception by the Mayor and West Ham Council.

10.30 a.m.—Presidential address by Mr. H. E. Blain, tramways manager, West Ham.

Paper: "Tramways Administration by Municipalities: A Retrospect and a Forecast," by Mr. Councillor S. C. T. Neumann, deputy-chairman Bradford Tramways Committee.

1 p.m.—Luncheon.

2 p.m.—Proceed to Tramways Depot, Greengate-street, Plaistow, by special cars.

2.15 p.m.—Discussion on the interim report of the Corrugation Committee.

3.30 p.m.—Inspection of depot and of the Exhibition of Tramway Appliances, &c.

7.30 p.m.—Corporation reception at the town hall.

September 26th.

10 a.m.—Paper: "Tramway Fares and their Basis," by Mr. W. J. McCombe, tramways manager, Hull.

12.15 p.m.—Luncheon.

1.15 p.m.—Proceed by special cars to tramway depot.

1.30 p.m.—Meeting of managers' section.

1.30 to 3 p.m.—Inspection of depot and Exhibition of Tramway Appliances.

3 to 5 p.m.—Garden party in West Ham Park.

7 for 7.30 p.m.—Association dinner at the Liverpool-street Hotel, E.C.

September 27th.

9.45 a.m.—Annual business meeting at De Keyser's Hotel.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, LEWES.

At a meeting of the Royal Sanitary Institute, to be held at the Town Hall, Lewes, on Friday, October 4th, at 7 p.m., Mr. D. Roberts, the borough surveyor of that town, will open a discussion on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams," among those who are expected to take part in the proceedings being Messrs. John H. Blizard, ASSOC.M.INST.C.E., Southampton, A. J. Martin, M.INST.C.E., Westminster, and A. E. Prescott, borough engineer and surveyor, Eastbourne.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute.

On the following morning the members will visit the Phœnix Ironworks and the Lewes Portland Cement and Lime works, and in the afternoon inspect the Lewes Victoria Hospital, the borough isolation hospital, the fire brigade station, and the waterworks.

A Town Free from Debt.—It was reported at a meeting of the Malton (Yorks) Urban District Council that the town is now entirely free from debt, the last instalment of borrowed money having just been paid.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

BUILDING INSPECTOR. September 7th.—Corporation of Burnley. £2 5s. per week.—Mr. P. Thomas, town clerk.

ROAD SURVEYOR.—September 7th.—Argyll County Council. £90 per annum.—Mr. D. Maclean, Estate Office, Strontian, Argyll.

SURVEYOR AND INSPECTOR OF NUISANCES. —September 9th.—Haverhill Urban District Council. £131 per annum.—Mr. Thomas Bates, clerk. Applications to be endorsed "Application for Surveyor."

CLERK OF WORKS.—September 9th.—Corporation of Coventry. £4 4s. per week.—Mr. G. Sutton, town clerk.

SURVEYOR.—September 9th.—Rothwell Urban District Council.—£105 per annum.—Mr. A. Tyldesley, clerk. Applications to be endorsed "Surveyor, &c."

JUNIOR ASSISTANT.—September 10th.—Borough of Batley. £80 per annum.—Mr. Oscar J. Kirby, borough engineer. Applications to be endorsed "Assistant."

CLERK OF WORKS.—September 10th.—Tavistock Rural District Council.—Mr. A. Kenneth Johnstone, clerk.

TWO TEMPORARY ASSISTANTS. — September 11th.—Norfolk County Council.—Mr. T. H. B. Heslop, county engineer, The Shirehouse, Norwich.

SANITARY INSPECTOR.—September 11th.—Town Council of Port Elizabeth. £200—£230.—Messrs. Davis & Soper, agents to the municipality, 54 St. Mary-axe, London, E.C. Applications to be endorsed "Abattoir Superintendent."

CLERK OF WORKS AND INSPECTORS. September 16th.—Tredegar Urban District Council. £3 per week. Also three inspectors of works, at £2 10s. per week each.—Mr. H. J. C. Shepard, clerk, Tredegar. Applications to be endorsed "Clerk of Works" or "Inspector."

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

DRAUGHTSMAN.—Survey Department of the Federated Malay States. Age between 25 and 35. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W. "M.5,511" to be quoted on left-hand top corner of application.

WORKS FOREMAN.—To construct concrete reservoir, engine and boiler house, mechanical filters, and lay mains in Southern Nigeria, under the direction of Mr. H. F. Peet, waterworks engineer to Southern Nigerian Government, Lagos. £350 per annum.—Messrs. Middleton, Hunter & Duff, consulting engineers, 17 Victoria-street, Westminster.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CHORLEY.—September 9th.—Designs for a school, for the corporation.—Mr. J. Mills, town clerk.

RANGOON.—September 28th—February 1st.—The date in the conditions in Clause 28 has been altered from August 31st to September 28th and in Clause 14 from January 1st to February 1st, 1913. The latest date for posting letters to reach Rangoon by February 1st will be by the Indian mail of January 10th.

LLANELLY. — September 30th. — Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium.—Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas. —Mr. J. Henry Field, town clerk.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

DERBYSHIRE.—September 7th.—For the erection of a school, for the Education Committee.—Mr. G. H. Widdows, architect, County Education Office, St. Mary's-gate, Derby.

ERPINGHAM.—September 7th.—For the erection of three pairs of cottages, for the rural district council.—Mr. J. T. Willis, deputy-clerk, Cromer-road, Sheringham.

LEIGH-ON-SEA.—September 9th.—For the erection of offices and weighbridge foundations at the gas works, for the urban district council.—Mr. J. W. Liversedge, engineer and surveyor.

OAKHAM.—September 9th.—For widening a bridge, for the rural district council.—Mr. A. H. Marsh, clerk.

LEITH.—September 9th.—For the erection of a school, for the School Board.—Mr. G. Craig, architect, 85 Duke-street, Leith.

LUTON.—September 9th.—For the erection of public baths, for the corporation.—Mr. J. W. Tomlinson, town engineer.

OLDHAM.—September 11th.—For the erection of a cart shed and other works, for the corporation.—Borough Surveyor.

LANCASHIRE.—September 11th.—For the erection of a temporary school, for the Education Committee. —Mr. H. Littler, 16 Ribblesdale-place, Preston.

NOTTINGHAM.—September 11th.—For the erection of a school, for the Education Committee.—Mr. F. B. Lewis, city architect, Guildhall.

HACKNEY. — September 12th. — For extension to electricity works, for the borough council.—Mr. W. A. Williams, town clerk.

WEST RIDING.—September 12th.—For additions to farm buildings, for the county council.—The Treasurer, County Hall, Wakefield.

PHILLACK.—September 12th.—For laying down 9 miles of water mains and fittings, the construction of two covered concrete reservoirs, and supplying and fixing machinery, for the urban district council.—Mr. W. G. Kempthorne, clerk.

TOWCESTER.—September 14th.—For the erection of seventeen houses, for the rural district council.—Mr. W. K. Higham, clerk.

TREDEGAR.—September 17th.—For the construction of foundations for a gasholder, for the urban district council.—Mr. D. W. Davies, Tredegar.

GRIMSBY.—September 17th.—For the erection of a council school, for the Education Committee.—Mr. Douglas Chandler, clerk.

HULL.—September 19th.—For the erection of a school, for the Education Committee.—Mr. J. H. Hirst, city architect.

KENILWORTH.—September 19th.—For the erection of a lodge and chapel at cemetery, for the urban district council.—Mr. S. Douglas, architect and surveyor.

LAMBETH.—September 19th.—For repairs, painting and lead roof work, for the corporation. Mr. H. Edwards, borough engineer.

RHONDDA.—September 20th.—For alterations and extensions to schools, for the urban district council.—Mr. W. P. Nicholas, clerk, Pentre, Rhondda.

BLACKBURN.—September 23rd.—For the erection of public halls, for the corporation.—Mr. L. Beard, town clerk.

LANARK.—September 24th.—For the construction of two bridges, for the county council.—Mr. W. E. Whyte, district clerk, District Offices, Hamilton.

SALFORD.—September 25th.—For alterations and additions to town hall and sessions court, for the corporation.—Mr. J. B. Broadbent, 15 Cooper-street, Manchester.

NORTH RIDING.—October 2nd.—For the erection of a cookery and manual instruction room, for the Education Committee.—Mr. J. C. Wrigley, secretary, County Education Offices, Northallerton.

Iron and Steel.

EDINBURGH.—September 11th.—For supplying cast-iron pipes, for the Water Trustees.—Mr. W. Boyd, W.S., clerk to the trustees, Water Trust Chambers, 12 St. Giles-street, Edinburgh.

MALDON.—September 16th.—For laying 2,000 yds. of cast-iron water mains, for the rural district council.—Mr. A. W. Freeman, clerk.

LEEDS.—September 30th—October 7th.—For the erection of steel and corrugated-iron building, and constructing surface-water drainage, for the Tramways Committee.—Chairman of the Tramways Committee.

MADRAS (India).—For the supply of about 9,500 tons of cast-iron pipes and special castings, with valves, and other works in connection with water supply distribution system, for the corporation.—Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster, S.W.

Roads.

WORSBOROUGH.—September 7th.—For the widening and reconstruction of a road, for the urban district council.—Mr. J. Whitaker, surveyor.

HANWELL.—September 7th.—For wood paving a portion of Boston-road, for the urban district council.—Mr. Percy Scott, clerk.

BEDLINGTON.—September 9th.—For making up a certain street, for the urban district council.—Mr C. D. Forster, 24 Grainger-street West, Newcastle-on-Tyne.

ITCHEN.—September 9th.—For work in ten roads, for the urban district council.—Mr. T. A. Collingwood, surveyor.

LEEDS.—September 9th.—For work of paving and flagging, for the corporation.—Town Clerk.

HENDON.—September 9th.—For making up certain roads, for the urban district council.—Mr. S. S. Grimley, engineer, Council Offices.

MAESTEG.—September 9th.—For works of road improvement and walling, for the urban district council.—Mr. Robert Seale, clerk.

KENDAL.—September 10th.—For making up certain streets, for the corporation. Borough Surveyor.

RABAT (Tangier).—September 10th.—For the construction of two roads, for the Special Committee of Public Works.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

EDMONTON.—September 10th.—For the supply of Guernsey and Aberdeen granite, for the urban district council.—Mr. W. F. Payne, clerk.

BEDFORD.—September 10th.—For the supply of broken granite, ironstone slag and ironstone tarmacadam, for the corporation.—Mr. C. Stimson, town clerk.

CARSHALTON.—September 11th.—For the supply of 300 yds. of 2-in. and 1,100 yds. of 1½-in. granite, either Cleehill, Quenast, Penmaenmawr or Guernsey, and the hire of steam roller, for the urban district council.—Mr. C. P. Lovelock, clerk.

HEMSWORTH.—September 11th.—For making up certain streets, for the rural district council.—Mr. J. Scholefield, clerk.

STOKE-ON-TRENT.—September 11th.—For making up certain streets, for the corporation.—Borough Surveyor.

BIRKENHEAD.—September 11th.—For making up two roadways, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor.

SUTTON.—September 11th.—For laying creosoted deal blocks, for the urban district council.—Town Surveyor.

HESTON.—September 12th.—For relaying wood paving at Hounslow, for the urban district council.—Mr. J. G. Carey, engineer and surveyor, Council House, Hounslow.

FELIXSTOWE.—September 12th.—For the supply of Guernsey granite, for the urban district council.—Mr. H. Clegg, surveyor.

CHELMSFORD.—September 12th.—For paving work with granite blocks, for the corporation.—Mr. W. Smith, town clerk.

PEMBROKESHIRE.—September 12th.—For the construction of 833 lin. yds. of roadway, for the county council.—Mr. R. C. Wheatley, clerk.

OXFORDSHIRE.—September 13th.—For the supply of road materials, for the county council.—Mr. S. Stallard, county surveyor, Oxford.

ALVASTON.—September 14th.—For the supply of slag rejections and granite, for the urban district council.—Mr. W. J. Holbrook, clerk, Full-street, Derby.

GREENFORD.—September 16th.—For the supply of gravel, hoggin, river flints and chalk flints, for the urban district council.—Mr. W. H. Read, surveyor, The Avenue, West Ealing.

ALTRINCHAM.—September 17th.—For widening, kerbing and channelling, for the urban district council.—Mr. H. E. Brown, surveyor.

ACTON.—September 17th.—For making up two roads and resurfacing several carriageways with tar-macadam, for the urban district council.—Mr. W. Hodson, clerk.

WATFORD.—September 18th.—For the supply of 4,480 tons of broken granite, and chippings and dust, for the urban district council.—Mr. W. Hudson, clerk.

REIGATE.—September 18th.—For the execution of private street works, for the rural district council.—Mr. A. J. Head, surveyor, 48 High-street.

HORSHAM.—September 20th.—For the supply of tar for surface treatment, for the rural district council.—Mr. W. Dengate, surveyor.

BURNLEY.—September 21st.—For road improvement work, for the rural district council.—Mr. H. Pritchard, surveyor.

NANTYGLO AND BLAINA.—September 23rd.—For the supply of limestone granite, limestone chippings and granite chippings, for the urban district council.—Mr. H. J. V. Shepard, clerk.

RUNCORN.—September 23rd.—For making-up work with tar-macadam and ordinary macadam, for the rural district council.—Mr. H. Swetenham, surveyor, 49 Northgate-street, Chester.

ST. NEOTS.—September 24th.—For the supply of broken granite, Roemac and Ferromac, for the urban district council.—Mr. J. Edey, surveyor.

TANGIER.—October 3rd.—For the construction of a road 1½ miles long, for the Committee of Public Works.—Specifications may be obtained at the Intelligence Branch of the Board of Trade, 75 Basinghall-street, E.C.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. SEPTEMBER 13, 1912. No. 1,078.

Minutes of Proceedings.

Notes from Recent Annual Reports.

Some of the most important of the figures presented with Mr. John Willmot's annual report were recorded in our issue of August 16th, p. 236. The maintenance cost per mile of main roads is just over £111, a moderate figure considering that the average cost for the whole of England and Wales is £75. For the information of our younger readers the conditions that lead to an expenditure considerably above the average may be briefly described. The mileage of Warwickshire "main" roads, or roads maintained directly by the county, is only 457½, or about one-fifty-second of the total for England and Wales, while the area of Warwickshire is about one-sixtieth of the total area of the Kingdom and Principality. If we took into consideration, however, the large areas in the West of England and in Wales in which there are no main roads, and other large areas in which there is a very small mileage of such roads, we should find that the Warwickshire main roads serve a much larger proportion than one-sixtieth of the area *really served* by main roads. Secondly, the density of population in Warwickshire is such that the main roads of the county, having only one-fifty-second of the total mileage of main roads, serve a population which is one-thirty-seventh of the total population—a very significant comparison. Thirdly, the character and distribution of a considerable proportion of the population of Warwickshire and adjoining areas is such as throws a heavy burden upon rural roads, the Black Country where Worcestershire, Staffordshire and Warwickshire meet being notably of this class. Fourthly, the county, in the heart of the Midlands, has a considerable through traffic, a large proportion of which traverses this relatively small mileage of main roads. Lastly, it may be noted that the service required of the roads is to some extent indicated by the rateable value of the area, which is nearly £8 10s. per acre, compared with about £6 5s. per acre for England and Wales, although the latter figure takes into consideration the great industrial areas of London, Lancashire and Yorkshire. The principal geological systems are the lias and the new red sandstone, both of which include strata which sometimes add indirectly to the cost of main-road maintenance. All these factors would result in a still higher cost of maintenance if the county were not favourably situated as regards materials suitable for main-road crusts, the cost of hard road metal having been during the year 8s. 1d per ton, and slag and rubble, chiefly used for foundations, costing 4s. 9½d. and 3s. 5d. per ton respectively.

As regards the traffic now carried upon rural roads it is worthy of note that the annual census taken on Surrey roads shows, as pointed out by Mr. H. Dryland, county surveyor, an increase of about 11½ per cent in motor vehicles, and a decrease of some 4 per cent in horse-drawn vehicles; and in this connection it may be pointed out that in addition to the through traffic from London to the south and south-east coasts, there has recently been some extension in the local use of motor vehicles for trade purposes in this part of the country. As regards roads in East Suffolk, the cost of maintenance of the 306 miles of main roads in that administrative county was just over £119 per mile; but the present is not a favourable opportunity for making comparisons involving this figure, since the roads of the county have passed through a severe crisis, involving exceptional expenditure, as will be seen by a reference to p. 282 (August 23rd), where the gist of this portion of Mr. W. Jervis's annual report is given. In a report by Mr. James Bee, Superintendent of the Blackpool Cleansing Department (p. 213, August 9th), the advantages of street watering are urged on the ground of efficiency and reliability as well as economy. Mr. Bee has found sea water very efficacious in laying dust, and the fact that the sea never dries up, even in the worst droughts, is beyond cavil. The cost of street watering in Blackpool during the year was only £7 per mile. In Bristol (p. 220, August 9th) surface tarring has proved successful, the cost of maintenance of broken stone roads having increased very little during the past five years, while the decrease in the amount of sweepings and slop removed since surface-tarring was adopted is some 20,000 loads per annum.

* * *

Tarred Roads and the Weather.

While the way in which a surface-tarred road is affected by the weather depends very largely upon the situation of the road and the nature of the roadside conditions, there are possibly some generalisations which may be of value as regards the effects of different kinds of weather upon tarred roads generally. The extent to which tarring is followed in certain areas is no doubt partly due to favourable conditions of soil and climate, but is also very largely dependent upon other circumstances, such as the proportion of motor traffic to the whole, and the extent to which the available crust materials are suitable for such traffic without surface tarring. While, therefore, the effects of climate and weather upon tarring policy may be properly studied by comparing one area with another, it is necessary also to take into consideration the information which may be gained by a study of the effects of different kinds of weather in the same area, or over the country as a whole.

The long hot spell of last year seems to have been, on the whole, favourable for tarred roads, the wastage of tar having been, in some cases, smaller than might have been expected, and the sliminess of certain roads in the autumn wet weather partly the result of the presence of an unusually large amount of tar at and near the surface. Partly, no doubt, it was to be ascribed to a lack of heavy showers and the resulting formation of tarry emulsion. A longish spell of mild and damp but not wet weather in the winter seems also to have a very favourable influence, and, if we except drizzling weather or prolonged and gentle rains, the kinds of weather that persist in spells of con-

siderable length seem to be, on the whole, favourable to the life and efficiency of surface-tarred roads. The hot summer of last year was due to the dominance of an open type of weather, with brilliant sunshine, and the breezes that are due to the effect of hot sunshine in warming up the land; and the condition of daily land and sea breezes was, in fact, in action for a considerable part of the summer, at any rate in the South of England. The hot sunshine being tempered by persistent breezes, the most serious damage done to tarred surfaces was mainly confined to roads unfavourably situated as regards cross currents and the play of wind upon the crust of the road. A comparison of last summer with the summer before—1910—and especially with regard to some hot June days, suggests that the worst kind of weather for tarred roads in summer is sultry weather. A few hours of hot, calm conditions, even with gradually weakening sunshine, on the morning of a summer day may cause more wounding of the surface than a whole day of hot sunshine and refreshing breezes.

Turning next to a consideration of the spell of wet, cool weather which has just been experienced, it seems to have been very favourable for tarred roads; the low temperature prevented softening of the surface, and the sharp showers which occurred at frequent intervals washed away the gritty mud formed during gentle rains, a material which is very damaging to tarred surfaces under a considerable volume of traffic, unless it be removed artificially or naturally at frequent intervals. Other factors, small perhaps in themselves, but of some importance if taken together, may also be noted, all tending to a reduction of traffic. In some districts the effects of the coal strike may still have been felt, but a more general cause of a reduction in traffic was the failure of harvests—the hay harvest over large areas in the Midlands, the second crops of hay in the South (after light first crops), and the general failure of the corn harvest. Besides the direct effects in a reduced amount of carting, the effect upon local trade and the farmers' purchasing power must have been considerable. Lastly, the wet spell included the holiday month of August, and the amount of pleasure traffic has doubtless been unusually small. Taking a year as a whole there is usually a good deal of give and take as regards conditions favourable and unfavourable to the maintenance of road crusts, but if we are to study the behaviour of tarred roads in the autumn in the light of our experiences in the summer, we must go into the matter somewhat closely, and consider all factors affecting the results.

* * *

The Local Government Board and Isolation Hospitals.

Some time ago, in consequence of a number of complaints which had been received regarding the large and increasing cost of construction of isolation hospitals, the Local Government Board instituted an inquiry in order that local authorities submitting schemes apparently too costly in character might be referred to more economical examples of what was needed. This inquiry has now been concluded, and a report containing a large body of information which will be very valuable to sanitary authorities and their officers in preparing plans for isolation hospitals has just been issued. It is now generally conceded that every populous district should be provided with hospital accommodation for the reception of cases of infectious disease, at least for such as are without proper lodging and accommodation, or which occur under circumstances involving special danger to the public health. The proportion of cases which it may be desirable to isolate in hospital will vary to some extent with local circumstances. When not in use for the acute infectious diseases isolation hospitals may be used for the treatment of cases of pulmonary phthisis. With the more general provision of isolation hospitals in recent years, however, there has been an undoubted increase in the cost. Although the common practice of estimating the cost of hospitals as so much per bed is not wholly satisfactory, it provides a rough basis for comparison. At the present day the cost per bed varies from £300 to £500, but even the latter figure is not infrequently exceeded. In the case of small districts, the report points out that considerable economy can be effected by combination. In this way duplication in site, fencing, water supply and drainage, administrative accommodation and offices may be avoided, since the provision for these matters which would be necessary for a hospital, however small, may suffice with but little increase for a considerably larger one. Moreover, combination facilitates the classification of patients in respect of the diseases from which they may be suffering, and it enables a competent staff to be more easily maintained.

With the exhaustive information contained in this report at their disposal, it will in future rest chiefly with the local authority to keep the cost of providing a hospital within reasonable and moderate limits. The chief suggestions which are made to meet this end are (in addition to the combination for hospital purposes of small districts into suitable areas of sufficient size) careful selection and judicious purchase of a site; the employment of a competent architect; the avoidance of superfluities and unnecessary ornament, and careful supervision over the progress of the erection; and the reduction of the space in some instances to 1,872 cub. ft. for each patient. The second part of the report contains a description of a number of the hospitals which were visited in the course of the inquiry, with comparison of their cost, mention being made of any circumstances which may have tended to raise or lower it. The report is very exhaustive, and should be in the hands of every official who is called upon to advise in the matter of the provision of a hospital for his district.

* * *

The Drainage of Isolation Hospitals.

The use of the earth-closet in rural districts and places where a proper system of drainage does not exist is very general, and is in some cases resorted to where water-closets might be adopted. It has been assumed that the earth-closet is a satisfactory method of dealing with the excrement, and that its adoption facilitates the disposal of the liquid wastes, but its use is now condemned by Dr. H. Franklin Parsons in his report to the Local Government Board upon the cost of construction of isolation hospitals. In this document it is stated that—"Earth-closets are not suitable for hospital use. There is no objection to admitting hospital sewage into sewers, and no need for any preliminary sterilisation." This statement is amplified in another paragraph which we print, together with other extracts from the report, on another page. In addition to the reasons given by Dr. Parsons, there are others which confirm his opinion that earth-closets are not suitable for isolation hospitals. Recent investigations with regard to the dissemination of disease germs by flies lead to the conclusion that earth-closets may even become dangerous when used in isolation hospitals. Unless they are always kept closed (except when in use), so that the interior is dark, and unless extreme care is used in disposing of the contents, it does not need great imagination to understand the possibilities of infection being conveyed from them to the inhabitants of the immediate neighbourhood by flies.

That these possibilities of infection are enormously reduced when the water-carriage system of drainage is adopted is clearly shown by the evidence in connection with the bacteriology of sewers and drains which appears in the recently published report of the Departmental Committee of the Local Government Board upon the intercepting trap. In any case, the earth-closet deals only with the excreta, and, as Dr. Parsons points out, the urine, washing water, and other liquids are also infec-

Construction of Isolation Hospitals.

REPORT TO THE LOCAL GOVERNMENT BOARD.

The following report by Dr. H. Franklin Parsons gives the results of an inquiry, directed by the board int the cost of construction of isolation hospitals. This inquiry has been carried out by Dr. Parsons from time to time as opportunities occurred during his official connection with the board, and has been completed by him since his retirement in 1911. The primary objects of the inquiry were to investigate complaints received by the board concerning the large and increasing cost of construction of isolation hospitals, and to furnish instances of satisfactory hospitals which had been erected at a reasonable cost, in order that local authorities bringing proposals before the board, apparently too costly in character, might be referred to more economical examples of what was needed.

In an introduction Dr. Arthur Newsholme, the board's medical officer, remarks that Dr. Parsons' report contains information which will be very valuable to sanitary authorities and their officers in preparing plans for isolation hospitals.

Recent improvements in means of communication and transport, it is pointed out, enable a hospital to serve a considerably larger area than was formerly thought practicable. The provision of a single joint hospital for a number of small districts enables important advantages, as regards both economy and efficiency, to be secured which are seldom practicable for small separate hospitals. This is especially the case for small-pox hospitals which may conveniently serve a larger area than those for other acute infectious diseases.

In a chapter on the cost of isolation hospitals, Dr. Parsons shows that the common practice of estimating the cost of hospitals at so much per bed gives rise to fallacious comparisons unless the size and suitability of the hospital are taken into account, a small hospital costing more per bed than a large hospital, as the cost of the site and the administrative buildings cannot be proportionally less in the former case.

It is contended that temporary buildings, such as iron hospitals, though apparently much cheaper than permanent buildings of brick or stone, are in reality less so than they appear. Dr. Parsons suggests that a practical comparison between temporary and permanent buildings can only be made when the cost of site, foundations, water supply and drainage, furniture and other requisites is included; and these, he observes, may sometimes be more expensive than the building itself. The ready inflammability and the imperfect protection against extremes of weather afforded by temporary buildings have also to be borne in mind.

The chief suggestions which have been made by Dr. Parsons with a view to keeping the cost of providing a hospital within reasonable and moderate limits are—the combination for hospital purposes of small districts into suitable areas of sufficient size; careful selection and judicious purchase of a site; the employment of a competent architect; the avoidance of superfluities and unnecessary ornament, and careful supervision over the progress of the erection; and the reduction of the space in some instances to 1,872 cub. ft. for each patient. In this connection a memorandum by the board's architect appended to the report should be carefully studied.

The second part of the report contains a description of a number of the hospitals which were visited by Dr. Parsons in the course of the inquiry, with comparison of their cost, mention being made of any circumstances which may have tended to raise or lower it.

In a chapter on compartment and cubicle blocks Dr. Parsons describes some of the more modern methods of hospital pavilion which have been designed with a view to the prevention of cross-infection.

An appendix to Dr. Parsons' report contains (*a*) The board's memorandum of 1902 "On the provision of isolation hospital accommodation by local authorities," with appendix issued in 1908. This memorandum sets forth the board's requirements in the case of isolation hospitals erected under their sanction, (*b*) an account by Dr. Theodore Thomson of the cubicle wards at the Pasteur Hospital and at the Hospital for Sick Children, Paris, (*c*) a comparison, by Dr. Parsons, of the cost of isolation hospitals and lunatic asylums, (*d*) a memorandum by the board's architect, Mr. Kitchin, on the cost of isolation hospitals.

HOSPITAL AREAS AND ADVANTAGES OF COMBINATION.

Discussing in his report the advantages of the combination of districts for the purpose of hospital provision, as compared with the establishment of a separate hospital for each district, Dr. Parsons mentions the following:—

By the establishment of a single hospital in place of two or more hospitals, one site only has to be obtained, and the number of possible or feared foci of infection is limited; the duplication of various buildings and appliances is avoided, and the cost of fencing and other requirements, proportionately to the number of beds, is reduced.

Thus an isolation hospital, however small, would require provision for—(1) A ward block for patients, (2) quarters for the staff, (3) laundry and other out offices, and these, it is recommended, should be in separate buildings. "Hence, having regard to the need for placing these buildings at a proper distance from the boundary and from each other, and, it may be, for ground on which to dispose of sewage and refuse, the site for a hospital, however small, can rarely be less than 1 acre. But the administrative and laundry accommodation which would be required for a hospital of only one small ward block would suffice, with comparatively small increase, for a larger ward block, or for two or even more ward blocks; and a site of 2 acres would thus afford space for buildings capable of holding many more than twice the number of patients who could be placed on a site of only 1 acre. A site of 1 acre, if rectangular and measuring 40 by 121 yds., would require 322 yds. of fencing to enclose it, but a site of the same length, if 80 yds. wide, would contain 2 acres instead of 1, and yet would require only 80 yds. additional fencing. Similarly with water supply, sewage disposal and other matters, works which would be necessary for a hospital, however small, would serve with comparatively small additions for one considerably larger. . . ."

Dr. Parsons continues: "Notwithstanding these obvious advantages, it is often difficult to induce local authorities to combine for hospital provision. Sometimes the objection arises from a desire to manage their own affairs independently, or from the jealousy and mistrust of one another, which are, unfortunately, too commonly met with among neighbouring local authorities. Sometimes local authorities fear that if a joint hospital district were formed the hospital for the combined district might be placed in or near their district, so that patients from other places might be brought into their own district or conveyed by road through it, involving, as they think, greater risk of infection than if the hospital were for the use of their own district alone. The experience of the board's medical department does not, however, support either of these objections. Except in the special case of hospitals for small-pox, there is no evidence that infectious disease ever spreads to the surrounding population from an isolation hospital at which the buildings are placed at a suitable distance from the boundary and are enclosed by a proper fence in accordance with the board's requirements, and which is properly administered.

"Local authorities sometimes contend that they can provide their district with sufficient means of isolation at less expense by separate action than by entering into a combination. This, however, generally means that they consider that a cheap temporary or existing building will suffice, or that some makeshift arrangement can be extemporised when infectious disease has broken out. Such expedients, however, are rarely satisfactory. The cost of procuring and adapting a site, providing water supply and drainage, and procuring furniture and other necessary equipment greatly reduces the apparent advantage on the score of economy of a wooden or iron building over a permanent one; existing buildings erected for other purposes cannot readily be adapted to make satisfactory hospitals, and extemporised arrangements, such as tents and huts, which have to be erected when an outbreak occurs, are frequently not ready until too late to be of much use."

DESIGN OF ISOLATION HOSPITALS.

The principle by which the Local Government

Board have been guided in cases where their approval of the construction of an isolation hospital is necessary are set forth in a memorandum issued last in 1902, with an appendix in 1908. Compliance with the board's requirements as here set forth is, however, Dr. Parsons remarks, obligatory only when the hospital is to be erected by means of a loan sanctioned by the board, or when for some other reason the board's approval is needed. In other cases local authorities have under sec. 131 of the Public Health Act, 1875, the power to "provide for the use of the inhabitants of their district hospitals or temporary places for the reception of the sick" without the approval of the Local Government Board or of any other Government department being needed, the responsibility for the suitable design position and construction of such places resting solely upon the local authority themselves. The plans in the hospital memorandum are intended as suggestions only, and it is open to local authorities to vary them in view of the requirements of their districts. But, except as regards the number of beds in the ward blocks, any deviation from the board's plans which is not inconsistent with the principles set out in the memorandum usually involves additional expense per bed, and it is claimed in the report that some of the cheapest hospitals have been those which have most nearly followed the board's plans.

COMPARTMENT AND CUBICLE BLOCKS.

Dealing with the subject of compartment and cubicle blocks, Dr. Parsons recalls that the construction of a ward block in such manner that each patient should be enclosed in a separate glass cell or compartment was suggested so long ago as 1871 by Mr. Henry Greenway, medical officer of health for Plymouth. It consisted of a double row of cells with glass sides and ceilings, placed back to back down the centre of a ward block, so as to leave a corridor on either side and at each end between the cells and the outer walls, and also a space above the cells under the roof. In 1890-1 the Plymouth Town Council sought sanction to a loan for the erection of a fever hospital on a modification of this plan. The glass compartments were for two or four beds each, and were in a single row having windows into the open air on one side and opening into a corridor on the other side. This corridor was divided by doors, one between every two compartments, with the intention that different infectious diseases could be treated in the block at the same time, and more or fewer beds be allotted to each disease as occasion required. The plan was, however, not approved by the Local Government Board.

The first hospital block on the compartment plan erected in this country with the sanction of the Local Government Board was that at the Walthamstow Hospital. In this, a one-storey block, the central corridor is omitted, access being obtained from an open verandah only, and the compartments are placed back to back in a double row, cross ventilation being provided for by a special arrangement of underground air ducts. Similar blocks have since been erected at other isolation hospitals, as at Norwich, Enfield, and Croydon.

In the Croydon block cross ventilation of the compartments is provided for by a series of decussating air shafts at the top of the compartments instead of underground ducts. One half of the top of each compartment forms a shaft which crosses obliquely over the adjoining compartment in the other row to open on the opposite side of the ridge of the roof.

In the board's plan, in which the compartments are in a single row, the difficulty as to cross ventilation, says Dr. Parsons, does not occur, as windows are provided on both sides of each compartment, and the same advantage is afforded by a block designed by Mr. Chart which has been erected by the Croydon Rural District Council at their hospital at Beddington Corner. This block is of a cruciform shape, the duty room forming the centre, and each wing containing three rooms separated by glass partitions, and opening on to a verandah.

At the East Ham Isolation Hospital a block has been erected in which the compartments are approached from a central corridor, but the block is a single storey one, and the roof of the corridor is raised and furnished with louvres on either side and with openings at each end for the purpose of cross ventilation.

The advantages and disadvantages of the glass compartment system are discussed in the report: "The advantages claimed for the system are that, with proper nursing precautions, it enables patients with different diseases to be treated in one block without risk of cross infection; that the cost of erection is less per bed than that of a block with small separate wards of the usual kind; that every one of the beds can be used at any time irrespective of how any other beds may be occupied; and that the glass partitions facilitate supervision and promote the contentment of the patients, who feel less lonely when they can see others than in separate wards. The disadvantages of the system as compared with a pavilion of the ordinary kind are that the capital cost per bed is greater; that more nurses are required for the same number of patients; and that the nurses must be of a high standard of discipline and assiduity. Hence a block on this system is not to be recommended as the sole provision in a small hospital, in which the nursing staff is often reduced to a minimum at times when the hospital is empty and fresh nurses are engaged from time to time, as current needs require."

DETAILS OF CONSTRUCTION.

Commenting on the suggestion that for the sake of cheapness the walls of hospital buildings might be constructed, in lieu of brick or stone, of the more recently introduced materials, such as concrete, concrete blocks, Frazzi, &c., Dr. Parsons says: "The Local Government Board have in one instance (at Acton) sanctioned a loan for the construction of a ward block built of blocks of clinker concrete, keyed together in cement mortar and rendered outside with a coat ¾ in. thick of cement and sand, the structure being supported by steel stanchions 12 ft. apart, which carry the roof. The cost of the walls was 5s. 10d. per super. yard complete, and the total cost of the block for thirty-six beds, including roads and drains, but not furnishing, was £4,000, or £111 per bed. The cost per cubic foot was 4·66d., that of the original pavilions, which have hollow walls of brick, having been 6·9d. per cubic foot. But the comparison is not quite fair, as the new block is much longer, the main wards containing eighteen and sixteen beds respectively, whereas those in the older blocks contain only six and eight, and, the centre and ends of the block being nearly similar in each case, increased length of the wards does not add to the cost of the block proportionately to the increased number of beds."

COST OF CONSTRUCTION.

The cost of isolation hospitals is frequently reckoned as so much per bed, the total cost, with or without site, being divided by the number of beds provided. But this method, while useful for purposes of comparison where the circumstances are similar, is, in Dr. Parsons' view, very fallacious, if certain important considerations are neglected. Of these the chief are: (1) That a large part of the cost of providing an isolation hospital is made up of items which are necessary for a hospital, however small, such, for instance, as site, fencing and road making, water supply and sewage disposal, quarters for staff, and offices; and the cost of these items does not increase in proportion to the number of beds. Hence a small hospital must be expected to cost more per bed than a larger one. (2) That, in view of the need for classification of patients, according to sex and disease, the usefulness of an isolation hospital depends not merely upon the total number of beds which it contains, but also upon their being available for use at any time under the varying contingencies of infectious disease that may occur in the district which it serves. (3) That it is the total cost of the hospital which is of concern to the ratepayers of a district rather than the cost per bed.

"It would be easy," the report continues, "to diminish the cost per bed of a small hospital by making the wards larger, but this would add to the total cost of the hospital, and, if the smaller building were sufficient for the needs of the district, without making it more useful. In a small district, for which a hospital of four beds, with facilities for classification, would suffice for the needs likely to arise, it will be cheaper to erect such a hospital at a cost of £2,000, or £500 a bed, than to erect a larger one of twelve beds at a cost of £3,000, although in the latter case the cost per bed would be only £250.

"But, in view of the disproportionate cost per bed of small hospitals, it is advisable to avoid their erection wherever possible, and, as already pointed out, the best way of doing so is usually by the combining of small districts into larger areas for the purpose of hospital provision.

"Assuming that the hospital authority possess a suitable site, with facilities for obtaining a water service and for drainage, the cost of erecting a permanent hospital of medium size, say twenty to thirty beds, in accordance with the principles set out in the board's memorandum, may be estimated at somewhere

about £400 per bed, varying from £350 to £500, according to circumstances, such as the size of the hospital, the facilities afforded by the site, the style of the buildings, and the local prices of labour and materials. Where circumstances are favourable and strict economy is exercised, it may be sometimes as low as £300 per bed, or even lower; and, on the other hand, £500 per bed has often been much exceeded."

Dr. Parsons points out that the most frequent cause of excessive cost of isolation hospitals, and the hardest to avoid, is the difficulty of obtaining a suitable and convenient site. A local authority desiring to erect a hospital, in order to get a site at all, often has to buy a larger and more costly one than is necessary for the purpose, to give a higher price per acre than the land would be worth for any other purpose, and to incur heavy legal expenses in meeting opposition;* and not only so, but any site obtainable is often so situated as to involve much further expense in adapting it for hospital use.

The report continues: "It has to be pointed out that the influence of the site upon the cost of an isolation hospital is by no means eliminated by reckoning the cost per bed as exclusive of site. If the site is remote from sewers and water mains, the cost of drainage and water supply may run into several hundreds of pounds, whether these wants are supplied by making connections of considerable length with the nearest public services or by constructing independent works on the site. Similarly, remoteness from gas or electric mains may involve expense in works for lighting. If the site is not on a good road expensive works of road making may be needed in order to secure a proper access. Sometimes the only site obtainable has been an old quarry or other excavated ground where much expense was involved in clearing and levelling the surface and in securing stable foundations; or, in other cases, the soft and treacherous nature of the ground or the risk of subsidence from undermining has added to the cost of foundations. If the site is far from a railway station, with bad or hilly roads, the cartage of building materials will add much to the cost of building, and may render it difficult to procure labour. All these extra expenses are liable to be debited to the cost of the buildings and are not included in that of the site."

COMPETITIONS.

Dr. Parsons adds: "Our experience would also lead us to agree with the Board of Education report that competitions for plans are, as a rule, a waste of time and money. If the criterion adopted by the adjudicators be that of economy, there is a risk that the cost of the scheme may have been underestimated by the successful competitor; if the criterion be theoretical completeness, it may tend to adoption of schemes having features not useful in proportion to their cost. In some cases schemes which have been adopted after competition have been found by the board to require modifications which have brought them into resemblance with other schemes which had been passed over, and this has caused dissatisfaction."

TEMPORARY v. PERMANENT HOSPITALS.

Comparisons, it is remarked in the report, are sometimes made between the cost of a permanent hospital, which may be £400 per bed, with that of the temporary hospital blocks sold by makers of iron buildings, who offer a ward block, professedly for twelve beds, for about £400, or the price of one bed in a permanent hospital. But it is insisted that in making this comparison several points have to be taken into consideration:—

(1) The maker's list price includes only the bare building above the foundations. Site, fencing, water supply, drainage, foundations, concrete under floor, furniture and fittings are all extras, and the building, of which the nominal price is £400, may come to cost £1,000, or more, before it is completed and ready for occupation.

(2) The hospital blocks offered by makers of iron buildings do not usually afford the board's standard amounts of linear distance between beds, floor area, and cubic capacity per bed. Thus a ward 30 ft. long, 20 ft. wide and 12 ft. mean height may be intended for six beds, giving only 10 ft. of wall space, 100 sq. ft. of floor space and 1,200 cub. ft of capacity per bed, as against the board's standards of 12 ft., 144 sq. ft., and 2,000 cub. ft. per bed. If the amounts of space were rendered equal by placing more beds in the permanent building, or fewer in the temporary one, the difference in their apparent cost would be proportionately reduced.

(3) The accommodation in a temporary block is usually available for one disease only, and affords no facility for classification of patients suffering from different diseases.

(4) The administrative accommodation in the temporary hospitals on the market is at a minimum. There is only one room for the nurse, or, at most, a duty-room and a bed-room, and that in the same block as the wards, and the provision for washing, &c., if any, is of the scantiest.

It is admitted that temporary hospitals are sometimes useful in an emergency, as during an epidemic, in view of the short time needed for their erection, provided that a suitable site is available. They may be used on occasion to supplement an existing permanent hospital, which will afford the necessary administrative accommodation, and the board have in some cases sanctioned short loans for their provision for this purpose. The objections to them are the deficiencies in space and accommodation already mentioned, their less durability as compared with brick buildings, and their need of frequent repairs, the imperfect protection which they afford against vicissitudes of weather—iron hospitals are hot in summer, cold in winter, and noisy in heavy rain or hail storms—and especially their liability to destruction by fire and storm.

The substitution for match-boarding of hard plaster—preferably on a base of wire netting or expanded metal instead of wooden laths—or of an incombustible material in sheets, as at the Capel hospital near Tonbridge, with means of protection against excessive changes of temperature, would, it is stated, go far to obviate the objections to wooden framed buildings, and the Local Government Board have in fact offered to sanction loans for buildings so constructed, provided that, as regards standards of space and other matters, they complied with usual requirements. The report makes it clear, however, the period allowed for repayment of loan in such cases would be shorter than for buildings of brick or stone; and such buildings would probably cost somewhat more than the ordinary match-boarded ones, so that the immediate advantage as regards annual cost of repayment of loan might not be great.

The report adds: "Apart from special circumstances, there may be advantages in the adoption of a somewhat lighter form of hospital construction with a shorter period of loan, as changes in the incidence of a disease, or in the methods of dealing with it, may affect the future usefulness of a hospital, so that it may be obsolete for the purpose for which it was erected before the time when, as a building, it is worn out. The useful life may be shorter than the structural life. Durability for all time need not therefore be aimed at in the construction of an isolation hospital. For the same reason a period of loan longer than thirty years for a brick building appears undesirable. As regards the durability of frame buildings covered with wood or corrugated iron, much will depend upon the original strength and careful construction of the buildings, and much also upon the care taken of them and the due execution of repairs as the need arises."

Timber buildings, it is remarked, deteriorate more rapidly than brick or stone ones when unoccupied. "For a frame building covered externally with weather-boarding or corrugated iron, and lined internally with plaster or incombustible material (not match-boarding) a period of loan of ten or twelve years, or perhaps even fifteen years, might appropriately be allowed. (The period allowed by the Board for a building of brick or stone is thirty years.) But in the later years of its life a frame building would require frequent expenditure on repairs to keep it in a habitable condition, and it would be undesirable that instalments of repayment of loan should have to be made at the same time."

SPECIAL MATERIALS.

The Board would no doubt be willing, says the writer of the report, to sanction the use in hospital construction of the more recently introduced materials and methods in any case in which they could be shown to be cheaper than the ordinary materials in use in the locality. The report of the Departmental Committee of the Board of Education recommended that local education authorities should be encouraged to submit proposals for the use of novel materials or methods of construction for public elementary schools, and that a loan period of thirty years should be regarded as

* In the Sevenoaks district the Cuddingstone Hospital Committee, by taking advantage of a suitable piece of land being in the market, were able to obtain a site of 6 acres for £300, whereas in order to obtain a hospital site for the remainder of the district the rural district council had to seek compulsory powers of purchase and to pay £2,250 for a site of five acres.

normally appropriate to such cases, instead of the period of fifty years allowed in cases where ordinary methods are used, but that it should be made a condition of approval that provision should be made for the periodical inspection of the structure.

"It must be remembered," he says, "that as many of these special materials are not impervious to moisture, buildings constructed of them require to be coated with cement on the outside, and that, owing to the thinness of the walls, more ample provision for warming is necessary than in brick or stone buildings. Until experience has been obtained of their durability, the loan period for such buildings should probably be shorter than for those of brick."

AIR SPACE.

In a further paragraph in his report, Dr. Parsons says: "I do not feel justified in recommending a less distance than 12 ft. between bed and bed in wards for acute cases, unless the beds are separated from one another by a fixed screen, but perhaps some concession might be made in other dimensions. It will be observed that the board's present standards are not commensurable one with another, and that while a ward 24 ft. wide might conveniently afford 12 ft. of wall space and 144 sq. ft. of floor space per bed, it would have to be made nearly 14 ft. high (13 ft. 10·36 in.) in order to give 2,000 cub. ft. per bed. But in practice the additional space required in order to obtain the required 2,000 cub. ft. per bed is more useful if given as width of ward than as additional height above 13 ft., and the dimensions commonly adopted are therefore 26 ft. in width and 13 ft. in height, which give 156 sq. ft. and 2,028 cub. ft. per bed. But an increase of width from 24 ft. to 26 ft. involves a corresponding increase in floor, end wall and roof, as well as a longer bearing and consequently increased strength of roof timbers.

"Seeing, therefore, that the board's standard would be complied with by a floor space of 144 sq. ft. per bed, with a height of 14 ft., and that the additional height from 13 ft. to 14 ft. is of comparatively little value for purposes of isolation and ventilation, I suggest that the board might allow a standard of 1,872 cub. ft. instead of 2,000 cub. ft., with a floor space of 144 sq. ft. and a wall space of 12 ft. as at present. In single-bed wards, or compartments in which one patient is entirely separated from another with efficient cross-ventilation, a less amount of space might be allowed. Thus in the appendix to the board's Hospital Memorandum the dimensions of the single-bed cubicles are 12 ft. by 12 ft. and 10 ft. high = 1,440 cub. ft."

WARMING AND VENTILATION.

In the opinion of the writer of the report, open fireplaces suffice for the warming of small wards, but in large wards these may conveniently be supplemented by radiators warmed by hot water, especially when a considerable elevation of temperature has to be effected. Hot-water radiators are not recommended as the sole method of warming, and central stoves may be dispensed with where radiators are provided. Natural ventilation by windows is considered to suffice for occupied wards, but the heat of stoves may be usefully employed as a supplementary means of introducing warm air and extracting foul air.

HOSPITAL SEWAGE.

Earth-closets are not regarded as suitable for hospital use. The report states that there is no objection to admitting hospital sewage into sewers, and no need for any preliminary sterilisation. Dr. Parsons says in this connection: "The water-carriage system of excrement disposal should, if possible, be always used in connection with isolation hospitals; earth-closets are not found satisfactory owing to the large amount of liquid which finds its way into them, the labour which their use entails upon the nurses, and the difficulty of providing a supply of suitable earth and of disposing of the contents. Sometimes sawdust impregnated with a disinfectant has been used in place of dry earth, and after use burnt in a furnace with the view of obviating the supposed danger of spread of infection of small-pox or enteric fever if infected excreta entered the sewers. There is, however, no evidence that these diseases can be thus spread if the contents of the sewers are properly disposed of, and even if the danger existed it would not attach solely to the faeces, but also to the passage into the sewers of infected liquids as urine and washing water. Sterilising tanks for sterilising the hospital sewage in bulk by steam or chemical disinfectants have in some instances been constructed, but I believe in the cases of which I have knowledge have, in course of time, been in practice abandoned."

MUNICIPAL WORK IN CANADA.

(From a SURVEYOR *Canadian Correspondent.)*

Although the British firms doing business in Canada have largely increased in numbers, there is room for many more, for Canada is still an importing country. She is a large buyer from the United States of many articles (especially those used by municipalities) which might be supplied by the Motherland. This applies to such commodities as concrete mixers, filtration plant, sewage pipes, and a hundred and one things which are used by contractors and municipal authorities. Conditions, it is true, are somewhat different to those in Great Britain, but those who desire to cultivate business may be strongly advised to visit Canada, to go from coast to coast and to study the position on the spot. Agents are all very well in their way, but no firm can really realise what is required unless a representative finds out for himself the conditions as they affect his particular business. The chairman of one of the largest English companies importing into Canada put it this way: "I now understand, as the result of my visit, the requirements of your market in a way which no number of letters from our agents could have stated it. I know exactly what is wanted; how the goods are to be packed; how they must be made for Canada; and although the trip has been expensive, it will in the end mean a larger trade and better service." Recently several firms who have business relations with this side have sent out special representatives, among them being Mr. Adams, a director of Adams-Hydraulics, Limited, of London and York.

* * * *

The good roads movement in Canada is making great headway. The roads in most of the rural districts are atrocious, but with the extended use of motor cars and the settling of many new districts, more attention is being given to the construction of decent highways. The Quebec Government propose to spend £2,000,000 in making new roads and improving the existing ones, the various municipalities being called on to pay only one half of the interest on the money borrowed for the purpose. An international highway from Montreal to the boundary line is also being made. The Ontario Government, too, is devoting large sums to better roads, while in the West there is a distinct improvement. It is, however, slow work, owing to the vast territory and the smallness of the population. In Westmount, a suburb of Montreal, Mr. A. Currie, the city engineer, a Scotsman, who has had a wide experience in South Africa and other parts of the world, is putting down a large number of tar-macadam roads, which are practically unknown in Eastern Canada. Mr. Currie, drawing on his British experience of these roads, decided to try one road last year and he was so satisfied that he is now making up many other roads with the same material. The difficulty hitherto has been to get dry stones, but this has been overcome by the employment of an improved hot mixer. The roads wear well, have a nice appearance and are practically dustless. It remains to be seen whether they will stand the intense frost, which in Montreal and other Canadian cities is probably the greatest difficulty with which road engineers have to contend.

Housing Arbitrations. — The Local Government Board, under the provisions of the first schedule of the Housing and Town Planning Act, have, with the concurrence of the Lord Chancellor, issued an Order making rules for the purpose of fixing the scale of costs to be applicable on an arbitration under the schedule.

Derwent Valley Waterworks.—The opening of the first section of the Derwent Valley waterworks was performed last week by Alderman Sir E. H. Fraser, chairman of the Derwent Valley Water Board. The scheme, full particulars of which have appeared in our columns, embodies the construction of five storage reservoirs in the Peak district, of which the first—Howden—is now completed and opened, while the Derwent reservoir is nearing completion. The others will be the Hagg Lee, Ashopton, and Bamford. There is also a service reservoir at Ambergate. The total capacity of the five reservoirs will be, roughly, 10,000 million gallons, and they will be supplied by a drainage area of 31,946 acres. The total available yield of water is estimated at 50,000,000 gallons a day, of which 33,333,333 gallons will be available for supply to the authorities benefiting under the scheme.

British Practice in Sewage Disposal.*

By ARTHUR J. MARTIN, M.INST.C.E., F.R.SAN.I., F.G.S., President of the Institute of Sanitary Engineers.

British practice in sewage disposal as it exists to-day is the outcome of many influences, social as well as physical, chief among these being the density of population over large areas of the country, the absence of great rivers, the generally retentive character of the subsoil, the humidity of the climate, and a widespread desire for uniformity and regard for precedent. The sewers are mostly on the combined or partly separate system, and it is exceptional for the whole of the storm water to be excluded from them. Purification works are therefore designed to deal fully with a certain amount of storm water in addition to the sewage proper, three times the dry-weather flow in all being the ordinary allowance. Excess flows over and above three volumes are usually passed through subsidence tanks and discharged without further treatment.

HISTORY.

The history of the sewage problem in England may be summed up in a few sentences. The earlier sewers were merely covered watercourses, or conduits laid for the conveyance of surface water, but on the introduction of water-closets in 1810 they began to be used as outlets for foul drainage also. Nothing in the shape of purification was attempted. The Towns Improvement Clauses Act of 1847 expressly legalised the discharge of sewage into a river or the sea. Eventually, however, the rivers became so foul from the increasing quantities of sewage poured into them that an outcry arose against their pollution. A series of Royal Commissions was appointed to inquire into the subject, with the result that the Public Health Act of 1875 and the Rivers Pollution Prevention Act of 1876 prohibited the discharge of crude sewage into a stream. For the better enforcement of the law, Rivers Boards were established in the basin of the river Thames and the populous valleys of Lancashire and Yorkshire. Nowadays, wellnigh every town possesses its purification works, and in many parts of the country villages, public institutions, and even mansions, are compelled to purify their sewage.

LAND TREATMENT.

The irrigation of land with sewage has been practised for more than a century, at first merely with a view to profit, but later as a means of purification. Where the area available was insufficient for irrigation, intermittent downward filtration was resorted to, one or other of these two methods being recognised as the standard mode of purification. The tendency to rely on land for this purpose was fostered by the conditions under which public sewage works were laid down. The cost of such works is almost invariably defrayed out of a loan, which can only be contracted with the sanction of the Local Government Board for the country concerned, and the English Local Government Board were in the habit of stipulating that treatment on land should form a part of every scheme of sewage disposal submitted to them. In many parts of the country, where the land was unsuitable in character or restricted in area, this requirement presented a serious difficulty, and in some cases urgently needed works were delayed in consequence.

ROYAL COMMISSION, 1898.

To deal with the situation thus arising, another Royal Commission on Sewage Disposal was appointed in 1898. This commission, which is still sitting, has issued seven reports, and the present British practice is largely founded upon the recommendations which these contain. Those recommendations have now been embodied in a series of informal but well recognised rules, to which new sewage works are expected to conform. The result has been to discourage the study of the special requirements of each individual case, and to produce works of a more or less stereotyped character.

For this reason, and because of the absence of great rivers, the purification of sewage by admixture with a large volume of fully oxygenated water has received comparatively little attention, and the fine mechanically operated screens which are used in Germany and the United States as a preliminary to purification by dilution are practically unknown in Great Britain.

* A paper read in the Engineering and Architectural Section of the Berlin Congress of the Royal Institute of Public Health, July 26th last.

Coarser screens, built up of parallel bars with intermediate spaces ½ in. or more in width, are frequently employed, more particularly where the sewage has to be pumped, and in large works they are generally considered an advantage. In such cases the screens are frequently cleared by means of continuously moving rakes. In small installations the amount of solid matter removed by screens is hardly sufficient to justify their employment, and their tendency to choke and to pond the sewage back in the sewers is a serious drawback to their use in any case in which a man is not constantly in attendance.

DETRITUS TANKS.

Whatever method is adopted for the purification of the liquid, it is usual as a preliminary to remove as much of the solid matter as possible by deposition. This is generally effected in at least two stages. The sewage is first passed through small chambers, known as "grit chambers" or "detritus tanks," designed for the interception of road grit and other heavy material. It is generally considered advisable to discourage the retention in these chambers of the ordinary sewage solids. The chambers are accordingly kept small, an ordinary allowance for their capacity being a quarter or half an hour's average dry-weather flow. In many large works provision is made for the continuous removal of the grit by mechanically operated dredgers.

Such diversity as exists in British practice in sewage disposal is chiefly manifested with regard to the means adopted for the deposition of the suspended solids and their disposal. For the interception of suspended solids other than grit, recourse is had to sedimentation tanks, precipitation tanks, septic tanks, hydrolytic tanks, or slate beds.

SEDIMENTATION TANKS.

Where simple sedimentation is adopted, the sewage is generally allowed to flow through the tanks continuously. The Royal Commission recommend that it should take from ten to fifteen hours to pass through the tanks, and that the latter should be cleaned out at least once a week. On the quiescent flow plan the tanks are filled and emptied alternately, the sewage being allowed to remain in them from two to three hours. To get the best results the sludge should be removed not less frequently than after every second filling.

CHEMICAL PRECIPITATION.

The precipitation of the suspended matters by means of chemicals has been comparatively neglected of late years in favour of methods which do not require chemicals or involve the production of so large a quantity of sludge, but the Fifth Report of the Royal Commission on Sewage Disposal has brought it once more to the front. The chemicals most in use are lime, alumino-ferric, ferrous sulphate (in conjunction with lime) and ferric sulphate. For purely domestic sewage alumino-ferric is most in favour. Experiments carried on by the commissioners with this precipitant point to the conclusion that it gives better results mixed with lime than when used alone. Where large quantities of trade refuse are present special precipitants will often be required.

If the sewage runs through the tanks continuously, it should remain in them about eight hours, but where quiescent settlement is adopted a stay of two hours will generally suffice.

Sedimentation and chemical precipitation aim merely at the separation of the suspended solids from the sewage, their disposal being effected by a subsequent operation. The biological methods go further, for they not only arrest the solids, but dispose of their more putrescible constituents by the agency of micro-organisms cultivated for the purpose.

SEPTIC TANKS.

The septic tank is the oldest of the biological tanks now in use, and it is still the most widely employed. Its essential features are a capacity approximating to one day's dry-weather flow (though good results have been obtained where the stay in the tanks has not exceeded twelve hours), and an arrangement of inlets and outlets which does not involve any undue disturbance of the tank contents.

It is often supposed that septic tanks should be hermetically sealed, but Mr. Cameron pointed out in

the early days of septic treatment that the tanks might be either closed or open, and this observation is confirmed by the Royal Commission.

SHAPE OF TANK.

The large majority of sewage tanks, whether used for sedimentation, chemical precipitation or septic treatment, are rectangular. Six feet is a very usual depth, and 5 to 1 an ordinary proportion of length to width. The rectangular form probably owes its general adoption rather to considerations of convenience in construction than to its efficiency for the purpose in view. Where the sewage is allowed to come to complete rest in the tank, the precise form of the latter is doubtless a matter of minor importance, but with continuous flows the shape of the tank has a marked influence on the results.

DORTMUND TANKS.

Considerable attention has been given to deep tanks in which the direction of flow is upward, as in the well-known Dortmund tank. The original Dortmund tank is cylindrical, with a conical bottom, the total depth being about 45 ft. Tanks of this type are used by Mr. Watson at Birmingham, not in this case, however, as primary tanks, but for the interception of the suspended matter in the effluents from septic tanks and trickling filters respectively.

WEDGE-SHAPED TANK.

In view of the need which there is for securing a minimum velocity of outflow, and the importance which many authorities attach to the avoidance of septic conditions, it is remarkable that more attention has not been given to wedge-shaped tanks. In such a tank, triangular on plan, and with the inlet at the apex of the triangle, it is far easier to secure a uniform distribution of the flow through the whole body of the sewage than in an oblong tank, and a much longer outlet weir (and consequently a lower velocity of outflow) can be provided in the former than in the latter.

The writer is not aware of any wedge-shaped tanks already at work, but a number of schemes involving their use are now before the English Local Government Board.

HYDROLYTIC TANKS.

The tanks hitherto referred to consist in each case of a single chamber, but of late years compound tanks, in which each unit consists of two or more compartments, have come into use. Among the earliest of these is Dr. Travis's "hydrolytic tank," of which not the least remarkable feature is the association of a theory (the well-known "Hampton doctrine"), according to which "the physical operations constitute the Alpha and Omega of all sewage purification processes," with a device expressly designed to promote hydrolysis.

The hydrolytic tank consists essentially of a "sedimentation chamber," into which the sewage is first led, a liquefying chamber, into which the heavier solids are swept through openings in the bottom of the first chamber, and a "hydrolysing chamber," containing concrete slabs, wooden splines, or other bodies, to the surfaces of which the colloidal matter in the effluent from the first two chambers may attach itself. A large installation of hydrolytic tanks has recently been completed at Norwich, and others are being laid down elsewhere.

EMSCHER TANK.

A new tank has recently been devised by Dr. Imhoff for use in the Emscher sewerage district. In form it presents a strong resemblance to Dr. Travis's tank, but its depth (30 or 40 ft.) is greater than that of the generality of hydrolytic tanks, the liquefying chamber is much larger, and the sedimentation chambers much smaller, and there are no "colloiders." The essential difference, however, between the two tanks is that, whereas Dr. Travis maintains a steady flow from his sedimentation chamber through the liquefying chamber, there is no flow through the liquefying chamber of the Emscher tank. Great importance is attached to the absence of any outflow from this chamber, whereby it is claimed that the sewage passing away from the tank is maintained in a fresh condition, and uncontaminated by products of decomposition. The Emscher tank has attracted very favourable notice in Great Britain, as well as in America.

CULTIVATION TANKS AND COARSE BEDS.

The various biological tanks above described, while differing in detail, have one feature in common—namely, the retention of the deposited solids in one continuous mass. It is held by many investigators that better results can be obtained by spreading these solids in comparatively thin layers over a large surface, upon which liquefying organisms are cultivated. This idea has found expression in Mr. Scott-Moncrieff's "cultivation tank" and Mr. Dibdin's "coarse beds," both consisting of chambers filled with coarse material, such as flints, broken bricks, or clinker, the interstices of which are filled with sewage. There is an essential difference, however, in the way in which these two appliances are worked. The cultivation tank is kept full of sewage, which flows through the interspaces of the filling material continuously, and is consequently treated under anaërobic conditions. The coarse bed, on the other hand, is alternately filled and emptied, the periodical recharging of the interstices with air being claimed to secure a constant aërobic condition.

SLATE BEDS.

The accumulation of sewage solids in the interstices of a mass of coarse material is attended by serious practical difficulties, which are more or less overcome by Mr. Dibdin's slate bed. The latter, while in principle identical with the coarse bed, differs from it in substituting for a labyrinth of irregular spaces, bounded by rough surfaces, a regular series of cells of uniform shape, and with smooth walls and floors, from which the deposited material readily comes away. The mode of working a slate bed is similar to that of a coarse bed. The bed is filled and kept full for a period of about two hours, during which the suspended solids are deposited by sedimentation on the slates, and the liquid is then drawn off.

The Royal Commission in their Fifth Report express "the tentative conclusion that primary beds containing large slabs of slate must be regarded more as preliminary settling or septic tanks than as contact beds." Mr. Dibdin has entered a strong protest against this view of the slate bed, the aërobic condition maintained in the latter, and the character of the organisms cultivated therein, effectively differentiating it in his judgment from the tanks to which it is likened by the commissioners. They, however, in an appendix to their Seventh Report, issued in 1911, and giving the results of their further observations of slate beds, adhere to the conclusion at which they had previously arrived. They do so on the following grounds: "The effluent from a slate bed is, for practical purposes, indistinguishable from a tank effluent. It contains about the same amount of suspended matter, and requires subsequent treatment similar to that which would be necessary for a tank effluent from the same sewage."

Slate beds have been favourably reported on by a number of well-known observers.

CHOICE OF TANK TREATMENT.

The commissioners consider that the choice of a preliminary treatment should depend mainly upon local facilities for the disposal of sludge, and upon the type of filter to be used, and the fineness or otherwise of the filtering material. They regard chemical precipitation as more suitable for strong domestic sewages, or sewages liable to give rise to nuisance, and septic tank treatment or sedimentation for weak sewages. In cases where the reduction of smell is of primary importance, the claims of the slate-bed process deserve consideration. The presence or absence of trade wastes should also be taken into account.

Other considerations which affect the choice are discussed. The opinion expressed by various eminent chemists and others that septic sewage is more amenable to filtration than fresh sewage is regarded as unfounded, but for sewages liable to great variations in strength and composition the value of the smoothing action of the septic tank is recognised.

Considerable controversy has taken place as to the proportion of the sewage solids which is digested in a septic tank. Having regard to the differences in the composition of the various sewages, and the difficulty of measuring accurately the amount of suspended matter in a sewage or tank effluent, the results recorded by the commissioners are fairly accordant, and agree very closely with Mr. Cameron's original estimate of the amount of digestion which takes place in the Exeter tank. There is a wide divergence of opinion with regard to the percentage of the sewage solids which is digested in a slate bed. The stress which has been laid on the question of sludge digestion is, however, out of proportion to its real importance, for the thing that matters is not the precise quantity of sludge which remains to be disposed of, but its character, and it has been clearly established

that any of the biological processes is capable of yielding a residuum which is free from the unpleasant characteristics of ordinary sewage sludge. On the other hand, it has been shown that septic tanks and slate beds alike can be so managed as to produce a very offensive sludge.

A more serious point is the amount of suspended matter in the effluent. This varies greatly in different works, even of the same class, and some far-reaching conclusions have been based on the amount of suspended solids coming away from particular tanks. The fact is often lost sight of that there is no need to send on to the filters all the suspended matter which comes away from the tanks, and the filters have suffered in consequence. A practical consideration of some importance is the amount of fall which is required by various preliminary processes. This is practically nothing in the case of continuous flow tanks, and several feet in that of quiescent flow tanks and slate beds.

SLUDGE DISPOSAL.

In the case of works situated on or near tidal water, like those of London, Glasgow and Manchester, the sludge is generally barged out to sea. In inland works burial in the ground is the usual mode of disposal, but in some of the larger installations the sludge is pressed into cake, which is either given away to farmers or sold at a nominal price. The Royal Commission carried out three series of experiments with seven sludges, all of which were artificially dried. Dr. Voelcker found that none were worth 10s. per ton for wheat-growing purposes. At Bradford, however, where the sewage contains a large proportion of wool-scouring liquor, and is consequently of a very greasy nature, the grease is extracted and sold. The receipts from grease in 1911 were between £20,000 and £30,000. The dry cake from which the grease has been extracted is exported for use as a manure. The present price at the works being 14s. per ton.

TRICKLING FILTERS.

Preliminary treatment.	Strong sewage.		Sewage of average strength.		Weak sewage.	
	Coarse or medium material.	Fine material.	Coarse or medium material.	Fine material.	Coarse or medium material.	Fine material.
Detritus tanks	15		25	—	40	
Septic tanks	45*		70	—	100	100
Settlement tanks (continuous flow)	45*	—	70	—	100	100
Settlement tanks (quiescent)	50*	25	100	70	130	130
Precipitation tanks (continuous flow)	65	50	100	80	150	175
Precipitation tanks (quiescent)	100	65	130	130	170	200

Notes as to filtering material.—A filter may be regarded as "coarse" if the material will not pass through a 1-in. sieve; as "medium," if it will pass through a 1-in., but not through a ½-in. sieve; and as "fine" if it will pass through a ½-in. sieve.

* If "medium" sized material were used in these cases the figures should be reduced by about 10.

CONTACT BEDS.

Preliminary treatment.	Strong sewage			Sewage of average strength.			Weak sewage.		
	Single Contact	Double Contact	Triple Contact	Single Contact	Double Contact	Triple Contact	Single Contact	Double Contact	Triple Contact
Detritus tanks		—	25	—	25	—	—	38	
Septic tanks ...	—		33		38		75	66	—
Settlement tanks (continuous flow)	—		33		38		75	66	—
Settlement tanks (quiescent)		—	33		50		100	—	—
Precipitation tanks (continuous flow)	—	33	—	—	50	—	133		
Precipitation tanks (quiescent)	—	33	—	—	66	—	133		

Notes.—The beds should not be less than 2½ ft. nor more than 6 ft. in depth. The different series of beds, in double and triple contact, should have an equal cubic content, failing any evidence to the contrary. Where a blank is left in the tables the particular treatment indicated would only be desirable in exceptional circumstances, as the method would not generally be economical.

FILTERS.

During the past few years trickling filters have been steadily growing in favour, as compared with contact beds, and this tendency has been emphasised by the findings of the Royal Commission. Taking into account the gradual loss of capacity of contact beds, they consider that a cubic yard of material in a trickling filter will generally treat about twice as much tank liquor as the same amount of material in a contact bed. The effluents from the former are usually much better aërated and of a more uniform character. On the other hand, the risk of nuisance from smell is greater with trickling filters that with contact beds, and there is also a danger of nuisance from flies.

CAPACITY OF FILTERS.

In arriving at the quantity of filtering material required to deal with a particular sewage, regard is had to the strength of the sewage, the nature of the preliminary treatment which it has undergone, and the size of the material. The foregoing tables give the number of gallons of dry-weather sewage which a cubic yard of filter may be expected to treat in the cases specified.

DETAILS OF FILTERS.

Considerable attention has been paid to the details of filters, particularly to those of trickling filters. Liberal provision is generally made for drainage and aëration, and a good deal of money is sometimes spent in covering the floor of a filter with drainage tiles of a somewhat costly type. It is worth noting in this connection that ordinary bricks are considered good enough for the draining floor of a waterworks filter. It was usual at one time to make the wall of a filter of perforated brickwork, or even to omit it altogether, in the supposed interest of free aëration, but the commissioners have shown that there is very little advantage in doing so.

Many excellent distributors for trickling filters are on the market. The rotary type are most in favour, but travelling distributors can also be obtained for rectangular beds. In the best practice the filter is fed continuously; but to meet the needs of distributors not capable of working with the small flows which this involves, dosing chambers are often used. Fixed jets which spray the effluent on to the filter are also employed, the head required ranging from 3 ft. to 7 ft. Where the fall is not sufficient to work a rotary sprinkler, fixed perforated pipes are used, in combination with an automatic ponding valve. In other cases an upper layer of fine material is relied on to distribute the effluent.

Where contact beds are employed, the filling and emptying are often controlled by automatic apparatus of various types, but in many large works it is thought desirable to be able to vary the periods of filling, contact and discharging, and the inlet and outlet valves are operated by hand.

A good deal of controversy has taken place with regard to the best size of the material for trickling filters, some authorities recommending diameters of 4in. and over, and others ¾ in. or less. Coarse material is generally considered desirable where the effluent to be filtered contains much suspended matter. In such cases a great deal of the suspended matter finds its way through the filters, and humus tanks or sand filters must be provided to intercept it.

STANDARDS FOR EFFLUENTS.

A desire has been expressed in many quarters that standards, chemical and bacteriological, should be laid down, to which sewage effluents should conform. This desire the commissioners have not seen their way to gratify. The futility of attempting to discriminate between a good and a bad effluent by means of chemical standards has been shown by Prof. Dr. Dunbar, who has obtained stable effluents containing as much as 3·55 grains of organic nitrogen per gallon. A weak point, moreover, of all such standards is that they take no account of the volume or circumstances of the body of water into which the effluent is discharged. A remarkable instance, showing the importance of regard to local conditions rather than to any arbitrary standard, occurs at Belfast, where the nuisance complained of arises, not from the foul constituents of the sewage, but from the decomposition of the seaweed (ulva latissima) which thrives upon it, and where consequently what is required is not a highly purified effluent, rich in nitrates, but one in which the amount of nutrient materials is reduced to a minimum.

STERILISATION.

The sterilisation of sewage effluents is not considered necessary or desirable. It is recognised that

sterilisation, to be of any practical value, must be applied, not only to the sewage effluent, but also to the whole of the storm water from the sewers, wherever discharged, and to all other contaminated liquids which may reach the streams, and that unless this is done the sterilisation of the sewage effluent can only produce a false sense of security.

PROPOSED CENTRAL AUTHORITY.

Questions connected with the alleged pollution of watercourses by sewage or sewage effluent not infrequently come into the law courts, where they are tried at great length, and with a formidable amount of highly conflicting expert evidence. The Royal Commission recommend the formation of a central authority, one of whose duties it would be to determine questions of this kind.

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie."

INTERCEPTING TRAPS.

To the Editor of The Surveyor.

Sir,—The recently published report of the Departmental Committee of the Local Government Board is one of such great importance that it should not be passed over or accepted without some discussion among those who are responsible for the public health.

The report is the result of four years' work by an expert committee, and should be carefully studied in every detail by those who are interested in this important subject. The results of the investigations that were made are very surprising, and will come as somewhat of a shock to those of us who for many years past have advocated the complete isolation of the dwelling-house from the public sewer.

But what can we say when Mr. Robson's careful experiments show that the trap is a veritable "trap" which catches and retains the solid matters which should otherwise reach the sewer. He proves by his experiments that from 40 to 79 per cent of the solid matters are thus caught and retained, even with the best designed and most carefully fixed traps.

Further than this, the accusations that initiated the work of the committee—*viz.*, that the trap frequently caused the complete chokage of the house drain—appear to have been established by the investigations of the medical officer of health of Willesden for, as the report says: "Many will be of opinion that the facts, indicating as they do that in modern intercepting traps over 23 per cent, or nearly one in every four, are likely to have been blocked at one time or another unknown to their users, show at least the necessity of finding an efficient remedy if the trap is essential, or of considering its abandonment if it is not essential."

Such an expression of opinion as the result of these examinations and experiments is extremely alarming, and on the face of it should be sufficient to shake our faith in the use of the intercepting trap. If the trap is to be retained, it would appear from the report that iron drains and traps should only be employed, and that this would only increase the cost over stoneware to an extent of from 9 to 12 per cent, spread over the whole cost of drainage and sanitary fittings—a mere trifle when the great advantages over iron for such purposes is considered.

The investigations and conclusions with regard to sewer air and drain air are also of extreme interest, and it would appear that we have hitherto much exaggerated the danger arising from sewer air.

Personally, I have been an advocate of the house drain trap for many years. I have always looked upon the sewer as a danger that should be kept at arm's length and that should my neighbours be suffering from a zymotic disease, it was safer to isolate my house by careful trapping and air disconnection from the public sewer; but in view of the report I feel that my opinions must be considerably modified. It would appear that the danger arising from the breathing of sewer air is not so great as I had feared, and that the trap even of the most approved form and design is more a hindrance than a help. In the report it is stated that the Local Government Board will not insist in the future on the insertion of the provision in the by-laws regulating the erection of buildings of the trap and fresh air inlet. It will be interesting to see if this will be so or not.

It occurs to me, however, that there may still be cases where the isolation of a house from the sewer may be necessary where the sewer is badly constructed and is a "sewer of deposit"; in this case surely there might be some risk if the sewer was ventilated through the soil pipe? The report seems to me to be one of the greatest importance, for, if we have been living in a "fool's paradise," trusting in the trap and so-called isolation from the sewer to give us security, and now find that the trap is an evil and is worse than useless, the sooner we wake from our dream and do away with this evil appliance the better.

It would be exceedingly useful if this very important subject could be further discussed in your columns.—Yours, &c.,

M.Inst.C.E.

[We agree with our correspondent that the subject is of first importance and well worthy of exhaustive discussion.—Ed. Surveyor.]

To the Editor of The Surveyor.

Sir,—The report of the Departmental Committee of the Local Government Board on the question of the intercepting trap presents, I think, very fairly all the useful evidence on the subject that is likely to be obtainable, and, by its pretty even balance of pros and cons, leaves the municipal engineer in the happy position of being able to adopt or refuse that much discussed piece of apparatus just as his predilections so dispose him. The report also contains some valuable information on that other unending controversy, sewer ventilation, the subject in which I was more particularly interested.

The conclusions summarised in the report were those I arrived at after numerous observations, and a long consideration of the matter some quarter of a century ago, and it was to give effect to those conclusions that I devised the sewer ventilator, a description of which I embodied in a paper read at a meeting of the then Incorporated Association of Municipal and County Engineers in January, 1903, which appears in vol. xxix. of the "Proceedings."—Yours, &c,

T. Caink

City Engineer's Office,
Guildhall, Worcester.
September 10, 1912.

AGE LIMITS FOR APPOINTMENTS.

To the Editor of The Surveyor.

Sir,—I cannot agree with your leader with regard to age limits for municipal appointments, and especially with regard to the appointment of head surveyor.

It must be remembered that a municipal surveyor is a servant of the public (and that of a prescribed area), and is paid by the public, but he is not a civil servant, responsible to a Government department. The work is a branch of engineering quite distinct from other branches, and a man having this training would not have much chance of taking up estate surveying or becoming an engineer, for instance, to a railway company.

Presuming all the papers and magazines of the country were controlled by councils, such as we have to deal with, and presuming you were of the age of forty-three, and that you rather thought of improving your position—or perhaps your leading article did not meet with the approval of your council, and you found yourself seeking another post—you would soon see it was more difficult to get a public position than one of a private character. The age limit would tell with treble force then.

I cannot quite appreciate your argument, for if a surveyor is treated at forty for a place of some responsibility, why are men of sixty years of age appointed as judges, Government officials in high places, and officers in the public services, posts of greater responsibility?

The age limit for chief appointments defines the age limit of assistants also. No assistant would not [illegible] that he knew that the time was coming when he would be at the running for a chief's position. He would more thoroughly learn the various branches of his profession, and would feel more confidence when appointed to a headship. At present, however, a man, after having served his articles and put in a year or so as an assistant, feels that he must be on the look-out for a chief's post. Councils naturally say, "Oh! it is one of the younger men can

do the work, well, next time we advertise we will have a young man and pay him a less wage."

I think, Mr. Editor, there are two reasons which weigh with councils:—

(1) They are not willing or prepared to pay for older and more experienced men.

(2) Where a council is governed by a majority of owners, they think a younger man is more tractable than one of riper years.

In reading your paper from week to week, I think my first contention is proved by comparing the salaries paid to surveyors with that of the general navvy ganger on public works. I think the latter would have the best of it by a good many pounds in a year.

A comparison of salaries paid by councils to their officials (more especially in urban and rural districts) with other classes of work might make interesting reading in your columns.—Yours, &c.,

UNKNOWN.

September 7, 1912.

[We are indebted to our correspondent for his letter. He employs the *argumentum ad hominem*, but this does not really touch the point at issue. The whole of our "Minute" last week was based on the supposition that the age limit and salary should bear some relation to the responsibilities of the position advertised.—ED. THE SURVEYOR.]

FACILITIES FOR PROFESSIONAL EDUCATION.

To the Editor of THE SURVEYOR.

SIR,—The season for evening lectures and classes will shortly be upon us, and many of your readers, especially the younger members of the profession, will be arranging their programme of work for the winter.

The lack of an authority co-ordinating all the educational efforts of the Metropolis, or of a central bureau of information, renders it difficult for students in and around London to ascertain all the numerous lectures and classes available, apart from those of their own immediate locality.

May I therefore call attention to the fact that in addition to the excellent L.C.C. Technical Institutes at Westminster (Vincent-square), Paddington (Saltram-crescent), Hackney (Dalston-lane), &c., the L.C.C. School of Building at Brixton and the Regent-street Polytechnic, the following bodies provide evening lectures in civil engineering, building subjects, or surveying?—

(1) Holloway Polytechnic, Holloway-road, N. (building and surveying).

(2) University College, Gower-street, W.C. (architecture and construction only).

(3) East London College, Mile End-road, E. (engineering).

(4) City of London College, Moorfields, E.C. (building and surveying).

(5) Battersea Polytechnic, Battersea Park-road, S.W. (engineering, building and surveying).

(6) Goldsmiths' College, New Cross, S.E. (engineering, building and surveying).

(7) King's College, Strand, W.C. (engineering and building).

(8) City and Guilds' Technical College, Leonard-street, City-road, E.C. (engineering).

(9) L.C.C. Central School of Arts and Crafts (Southampton-row, W.C. (building).

(10) Birkbeck College, Chancery-lane, E.C. (engineering physics).

Complete A.M.I.C.E. courses are provided by the Westminster and Hackney Institutes, and by Nos. (3), (5), (6), (7) and (8). Complete courses for the examinations of the Surveyors' Institution are provided by the Hackney Institute and by Nos. (1) and (4). The full A.R.I.B.A. course is provided by No. (1).

Lectures on reinforced concrete are given at the School of Building and the Westminster Institute.

The fees are very reasonable, and a full prospectus can in every case be obtained on application to the principal or secretary.—Yours, &c.

T. GUY NEWCOMEN.

Council Offices,
Finchley, N.
September 10, 1912.

[We are obliged to Mr. Newcomen for his letter, the useful information contained in which will, we are sure, be greatly appreciated by students in and around the Metropolis.—ED. THE SURVEYOR.]

THETFORD PROPOSED WORKMEN'S DWELLINGS.

To the Editor of THE SURVEYOR.

SIR,—With regard to the particulars published in your issue of yesterday as to the fifty cottages which it is proposed to erect at Thetford, I should be extremely obliged if Mr. Wearing would favour me, through the medium of your journal, with the following information:

(1) The amount paid for the 3 acres of land, including legal charges.

(2) What will be the rateable value of the cottages and the amount of rates in the £?

(3) What allowance is made for—(*a*) empties, (*b*) insurance, and (*c*) repairs?

(4) Will the sink wastes be drained to a cesspool or sewer? If the former, who will be responsible for the cleansing?

I have recently been preparing a scheme for providing workmen's cottages at a rental of 4s. 6d. per week, the accommodation being similar to that shown on Mr. Wearing's plans, but so far I have not been able to satisfy myself that the scheme would be self-supporting.—Yours, &c.,

ERNEST E. RYDER.

Council Offices,
Bushey, Herts.
August 31, 1912.

[Mr. Wearing, to whom we submitted our correspondent's queries, has courteously replied as follows to the points raised: (1) £750; (2) average assessment £7 2s. 6d., rates (general district) 2s. 6d. in the £; (3) (*a*) 3 per cent, (*b*) 1s. 6d. per cent, (*c*) 30s. per house per annum; (4) sink wastes drain to sewer.—ED. THE SURVEYOR.]

THE UNITED STATES GALLON.

To the Editor of THE SURVEYOR.

SIR,—In many papers appearing in your journal in connection with bituminous road construction in the United States, I note the frequent occurrence of the term "gallon." It may be that some of your readers are not aware, or perhaps fail to bear in mind, that the measure here indicated—namely, the United States gallon—is different from ours.

Roughly, the United States gallon contains 8·33 lb. of water, while the British gallon contains 10 lb.—Yours, &c.,

JOHN HUTCHINSON.

11 Tothillstreet,
Westminster,
London, S.W.
September 9, 1912.

[We thank Mr. Hutchinson for his timely reminder that we have not recently noted this difference in our references to United States gallons. The relation may also be expressed: Six United States gallons are equal to five British gallons. The United States gallon is not, however, a foreign measure; it is our own Winchester gallon.—ED. THE SURVEYOR.]

GARDEN CITIES AND TOWN PLANNING.

To the Editor of THE SURVEYOR.

SIR,—May I ask you to draw the attention of your readers to the fact that this association is prepared to send lecturers to any part of the country to deal with the great and increasingly important question of garden cities and town planning?

The housing of the workers demands more and more attention as time goes on, and the inquiries which we receive from all parts of the world show how genuine is the desire that something shall be accomplished.

In order to focus these aspirations, lecturers competent to deal with all aspects of the case have been secured, and dates may be booked up.

Lectures may be either singly or in series, and I shall be glad to hear from anybody interested with a view to making arrangements.—Yours, &c.,

LEWART G. CULPIN,
Secretary.

3 Gray's Inn-place,
London, W.C.
September 4, 1912.

Sanitary Association of Scotland.—The annual meeting of the Incorporated Sanitary Association of Scotland takes place at Montrose next week, commencing on the 18th inst. The membership of the association is now 457.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

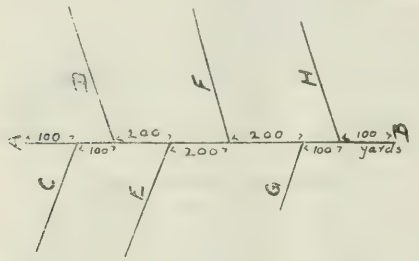
Mr. H. F. Wilkinson, of Tottenham, to whom the premium for August was awarded, has selected "Water Supply of Towns," by Burton (Crosby Lockwood), and a copy of this work has been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

271. Bending Moments.—If a straight prismatic baulk of timber floats in a horizontal position with a weight of 4 cwt. hung to each end, what will be the bending moment at the centre of its length?

272. Surface-Water Drainage.—State, showing the method of working out, the sizes of pipes necessary to take the surface water from streets as per sketch.



Streets are 36 ft. wide, and tar paved; all the houses are drained on the combined system, so that no surface water from the forecourts, &c., need be reckoned. Rainfall ½ in. per hour.

Street.	Length.	Fall
A–B	1,000 yds.	1 in 40
C	200 ,,	1 in 20
D	300 ,,	1 in 10
E	200 ,,	1 in 20
F	500 ,,	1 in 30
G	100 ,,	1 in 15
H	150 ,,	1 in 50

(F. H. S., *Sheringham*.)

273. Cast-Iron Stanchion.—Calculate the size of a cast-iron stanchion 12 ft. in height alongside an external or party wall to carry a load of 54 tons. (T. R.)

274. Administration.—What is the best arrangement of the columns in a surveyor's cash-book (also wages-book), to show, in addition to the usual items, separate columns for the workmen's and the council's contributions under the National Insurance Act? ("R. D. C.")

275. Cantilever.—A cantilever of uniform cross-section and length L carries a concentrated load W at the free end. A prop is placed at a point $\frac{L}{4}$ from the free end, bringing this point to the same level as the fixed end. Find an expression for the reaction at the prop, and the deflection of the free end of the cantilever. Neglect the weight of the cantilever. (B.Sc.Eng. Final.) (H. F. W., *Tottenham*.)

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham*.)

REPLIES TO QUESTIONS.

267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

The following are the chief heads of a specification for the conversion of a macadamised into a wood-paved road.

(1) Interpretations.

(2) General Stipulations and Conditions.—Contractor to sign plan and specification; Extent of contract; Period, commencement and completion of work; Penalty for non-completion of work in time specified; Setting out work, contractor's responsibility; Contractor to keep work in repair for — months; Contractor to provide all labour and materials; Contractor to provide all lights, fences, watchmen, and take precautions against accidents; Improper materials; Alterations and additions; Sub-letting; Disputes; Foreman and workmen; Control over works; Measurement of works; Bankruptcy of contractor; Contractor to give security; Tender and schedule of prices; Terms of payment; Night work; As to Employers' Liability Act; Insurance by contractor.

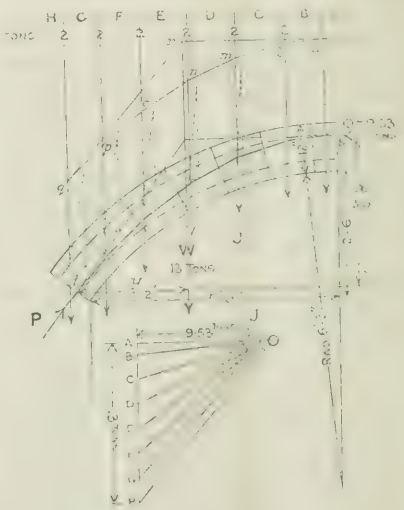
(3) Specification of Works.—Excavation of existing macadam; Macadam to be screened and suitable material left, used for concrete; Surplus rubbish; Cement and cement mortar; Portland cement concrete; Foundations, 6 in. Portland cement concrete, floated off with Portland cement mortar, ½ in. thick, to exact contour of roadway; Wood blocks, and how bedded; How the joints are to be laid and grouted; Width of expansion joint parallel with kerb filled with sand or puddled clay; pavement completed, surface to be strewn with sharp sand or fine gravel. (W. D., *Dudley*.)

[W. D. has answered the question proposed, but it would be interesting if some correspondent would send a complete "Specification of Works."—Ed. The Surveyor.]

269. Masonry Arch.—Draw the line of least resistance in a stone segmental arch of 10 ft. span with a rise of 2 ft. 6 in., the voussoirs having an equal thickness of 12 in. and each being equally loaded. (A.M.I.C.E.)

The graphic method of trial and error is the simplest way to determine the line of least resistance. This method is only approximate, but is accurate enough for practical purposes.

As the arch in question is to be symmetrically loaded, it is only necessary to deal with one-half. The load on each voussoir is to be equal. Let this load be taken as 2 tons, made up as follows: Weight



of voussoir, 2 cwt.; superincumbent load, 38 cwt.; the actual position of the vertical force being obtained as indicated on the diagram. The total or resultant load on the half arch will thus be 13 tons.

To find the position of the resultant load, draw the force polygon A---H. Then select a polar point O somewhere in a horizontal line from A, and join AO, BO, &c. Now construct the linear arch diagram *klm---r* by drawing *kl* parallel to BO, *lm* parallel to CO, &c. Now *kr* and *qr* will intersect at *r*, which point is in the pathway of the resultant load W.

The Surveyor
And Municipal and County Engineer.

Three Point Problem in Surveying	343, 344

The half arch is kept in equilibrium by:

(1) W, which is the total or resultant load on the half arch.

(2) Q, which is the horizontal pressure at the crown, and which balances W.

(3) P, which is the pressure or reaction at the abutment, and which is equal and opposite to the resultant of the forces W and Q.

The line of least resistance required will be that line of resistance which is just included within the middle half of the arch ring consistent with the least value of Q.

Now, as Q will be least when y is least, and x is greatest, as a trial select a point of application, S for force Q, slightly within the middle half, and a similar point of application for force P at t.

Then, as Q balances W:

$$Q \times x = W \times y$$

and

$$Q = \frac{W \times y}{x}$$

$$= \frac{13 \times 2{\cdot}2}{3{\cdot}0}$$

$$= 9{\cdot}53 \text{ tons.}$$

Now construct the stress polygon A, B, ---J, by drawing AJ = 9·53, and joining BJ, CJ, &c. Then, by drawing the reciprocal lines of the polar polygon on the arch diagram, commencing at vertical force k, a line of resistance will be indicated. As this is just inside the middle half of the arch ring, and is consistent with the least possible value of Q, it is the line of least resistance required. (I. W. S., *Clapham Junction.*)

Terrors of the Madras Streets. A citizen of Madras thus describes, in a letter to a local paper, one of the perils of the pedestrian in that city: "Sir,—It is my longfelt *desideratum*, nay, rather avidity, to contribute a few lines to your worthy and widely circulated daily regarding the censorious inconveniences to which the pedestrians are constrained inveterately to circumscribe into owing to the cows being allowed to prowl in swarms, especially during nights, in the main and heavy-traffic centres, to the deterioration of many sarcastic accidents of personal danger, and no wonder the other day, while I was passing along the Mint-street I had to come across with a terror as an old man was about to be gored by a gigantic cow, and but for not the sudden alarm that was raised by others his condition would have been otherwise."

DISS NEW WATER SUPPLY.

DETAILS OF PLANT.

The new waterworks at Diss, which are almost completed, are based on the supply of 20 gallons per head per day to 4,000 people. There are two bored tube wells, 400 ft. deep, lined with steel tubes 10 in. in diameter to a depth of 160 ft. below the surface. These boreholes enter below the lining tubes a further 240 ft. into chalk, the upper surface of which was found about 97 ft. below the surface of the ground. In each borehole is a pump 8 in. in diameter, and with a 3-ft. stroke. A gas engine supplies the motive power for each pump. When the two pumps are running at the slow speed they will throw 80,000 gallons in ten hours. In case of overhaul to one pump the other can be run at a higher speed so as to deliver 80,000 gallons in under fourteen hours. From the pumps the water passes to the softening plant, and thence back to soft-water pumps, which raise the softened water to the tower. The water tank measures 34 ft. 6 in. by 27 ft. 6 in., by 5 ft. 3 in. deep, and is designed to contain 30,000 gallons. It is carried by steel girders disposed as a grillage upon a tower of brick 33 ft. by 26 ft. over all, and 46 ft. high from the ground to the tank bottom.

The tower, which is built of Fletton bricks, is of plain design, with four corner piers, fourteen intermediate piers, and eight solid panels. The remaining panels, ten in number, are lightened with windows or doors, and each of the eighteen terminates in a circular arch, which is flush with the outer face of the piers, and serves to carry the straight emblature upon which the wall plates of the tank girders are bedded. Inside the tower is a floor 12 ft. above the ground. One-half of the ground floor is occupied by an office, workroom, &c., and the other half by the engine-room, in which are two gas engines to drive the two pumps respectively. On the north side of the tower a lean-to roof covers the gas producers.

The softening plant stands about 20 ft. north of the tower. The town mains start with a diameter of 6 in., and they are ultimately reduced to 3 in., at which they reach the twelve terminal points. Valves are provided by which the town can be cut off in sections. The elevation of the site of the waterworks is 138 ft. above sea level, and the maximum additional head of water is 51 ft., the tank roof being nearly 200 ft. above sea level. The head of water will exceed 100 ft over a great part of the town.

The engineer is Mr. William H. Booth, F.G.S., London, and the following contractors have been employed: Wells, Duke & Ockenden, Littlehampton, and Perkins, McIntosh & Co., St. Albans; tower, F. & H. Higgs, Loughborough, S.E.; pumps, Perkins, McIntosh & Co.; gas engines, Rushton, Proctor & Co., Lincoln; softening plant, J. W. W. Boby, London; mains, G. C. Tilley & Co., London; tank, Gimson & Co., Leicester; sundry work, J. Aldrich & Co., Diss.

WATER SUPPLY ON THE GOLD COAST.

PUECH-CHABAL SYSTEM FOR ACCRA.

The Crown Agents for the Colonies have placed a contract for the erection of a complete multiple filtration plant on the Puech-Chabal system for the water supply of Accra, the capital of the Colony. The consulting engineers are Messrs. Middleton, Hunter & Duff, of Westminster, and the works will be carried out by Mr. Walter Clemence, of Westminster, for Monsieur Puech.

The system of multiple filtration introduced and patented by M. Armand Puech has been devised mainly with the object of improving the method of purifying water by slow sand filtration. With a complete Puech-Chabal installation, it is found that the final sand filters run on an average for more than twelve months without scraping, when dealing with turbid waters, as the suspended matters are entirely removed by the Puech degrossisseurs and pre-filters. These are provided with apparatus for rapidly cleansing the gravel or sand, so that one man can easily control a plant with a capacity of from 15,000,000 to 20,000,000 gallons per twenty-four hours. The saving in labour and in cost of sand washing is, of course, very great, while the yield of the sand filters is, in most cases, doubled, and the risk of having a large portion of the plant out of action for cleaning is avoided. The system has now been adapted for sewage treatment, the sludge being easily and rapidly removed by means of the patent apparatus for cleaning by air.

HORBURY SEWAGE WORKS.

FERRO-CONCRETE CONSTRUCTION.

An extensive series of structures in ferro-concrete comprised in the sewage disposal works designed by Mr. J. H. Drew, M.Inst.C.E., for the Horbury Urban District Council, when acting as the engineer and surveyor to that body, is described in the September issue of *Ferro-Concrete*.

The works are designed to treat a dry-weather sewage flow of 295,000 gallons daily, including 50 per cent of manufacturers' trade effluent from dye works, wood scouring mills, and oil works. The complete scheme, which has been approved and loans sanctioned by the Local Government Board, involves an outlay of £10,000, and comprises alterations and additions to the existing pumping and other plant, and the construction of equalising chambers, detritus and screening chambers, percolating filters, effluent channels, Venturi meter, humus tanks, storm water and sludge drains, and appurtenant works.

Fig. 1 is a general plan of the equalising tanks and detritus chambers. Commencing at the top of the drawing, we have first a channel 2 ft. wide by 9 in. deep with connection to the existing sewer. Next

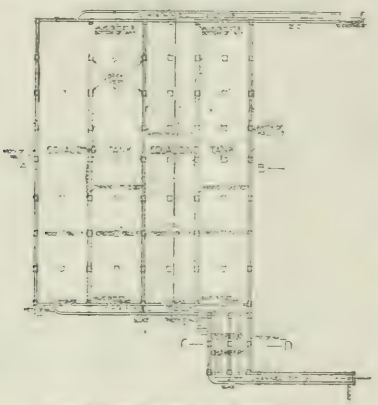

Fig. 1.—Plan of Equalising Tanks.

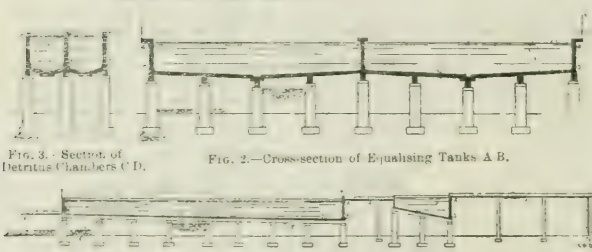

Fig. 3.—Section of Detritus Chambers C D.

Fig. 2.—Cross-section of Equalising Tanks A B.

Fig. 4.—Section E F.

Horbury Sewage Works.

come the equalising tanks constructed in duplicate, so that either of them can be filled and emptied independently, thus providing a safeguard against any interruption of work as the result of breakdown, and affording facilities for the effectual cleansing of the tanks.

The two tanks measure 81 ft. 6 in. long by 63 ft. wide over all, and are divided by a centre wall 5 in. thick at the bottom and 4 in. thick at the top, the outer walls being of the same thickness. Each tank has the capacity of 70,000 gallons. The floors are of ferro-concrete, 5 in. thick, supported on beams 7 in. wide by 8 in. deep, carried on brick piers, 11 ft. 6 in. square in cross section, founded on plain concrete footings, 2 ft. 6 in. square by 12 in. thick, and finished at the top by a ferro-concrete template 4 in. thick. At the [illegible] was found to be capable of supporting a load of 2 tons per square foot, so that [illegible] ample provision [illegible]. The floor of each tank slopes to a centre channel, 12 in. wide by 3 in. deep, as shown in Fig. 2, and the whole floor has a longitudinal fall, as represented in Fig. 4.

At the outlet end of the equalising tanks there is another channel, 2 ft. wide by 9 in. deep, communicating with the detritus chambers. The latter, which are in duplicate, measure 16 ft. long, and each chamber is 6 ft. wide by 6 ft. 3 in. deep over all, the bottom sloping to a centre channel, as shown in Fig. 3, and having a longitudinal fall, as represented in Fig. 4. The chambers are built upon brick piers 1 ft. 6 in. square, founded on plain concrete blocks 2ft. 6 in. square by 12 in. thick, the top of each pier being finished by a ferro-concrete template, as in the case of the equalising tanks. The detritus chambers provide an additional precaution for the removal of mineral or other substances, and, being in duplicate, either of them can be used independently.

Fig. 4 is a section on the line E F passing through the entire series of tanks and channels and making the whole arrangement clear.

Fig. 5 gives a plan and section of the filter-bed, the floor of which has a diameter of 91 ft. 6 in. and is 5 in. thick, being supported by main beams, 7 in. wide by 13 in. deep, running from pier to pier, with secondary beams, 5 in. wide by 11 in. deep, at right angles to the main beams. The beams and flooring are reinforced according to Hennebique standard practice, the whole forming a monolithic unit. Around the periphery of the floor is a continuous ring beam supported at intervals by brick piers, and from this projects a cantilever channel, measuring 24 in. wide by 6 in. deep.

As the soil was capable of carrying the load of 1½ tons per square foot, the supporting piers were built up in brick from plain concrete foundation blocks, the interior piers being 2 ft. square, and those for the ring beam 1 ft. 6 in. square, the foundation blocks 6 ft. square by 15 in. thick. The piers are 4 ft. 6 in. high, and completed by ferro-concrete templates carrying the main beams and the ring beam of the floor. The filter is completed by a circular brick wall, 9 in. thick by 7 ft. high, strengthened by two encircling ferro-concrete bands, 9 in. square in cross section. The floor was designed for a superload of 6¼ cwt. per square foot, and is covered by a layer of Limmer rock asphalt ½ in. thick.

The contractors are the Yorkshire Hennebique Contracting Company, Limited, of Leeds, and the consulting engineers for the ferro-concrete work are Messrs. L. G. Mouchel & Partners, of Westminster.

Street-watering Appliances.—The borough engineer of Grimsby, Mr. H. Gilbert Whyatt, has been instructed to report on motor-driven street-watering appliances, and will be glad to receive particulars from makers.

Electricity from Refuse.—The city refuse of Minneapolis, Minn., is being utilised to generate electric current for 150 arc street lamps of 6·6 amperes each, which have recently been put in service, and the city council have now authorised the installation of fifty additional ones.

Joint Sewerage System.—At a conference of representatives of local authorities recently proposals for a joint sewerage scheme for the districts of Finchley, Hendon, Friern Barnet, and East Barnet Valley were discussed, and a resolution was passed adopting the principle of discharging the sewage of the above-mentioned districts into the London County Council's system, [illegible] upon the cost and conditions being satisfactory to the local authorities.

Antrim Roads. The county surveyor of Antrim, Mr. John H. Brett, in his report to the county council last week, stated [illegible] roads projected amounted to £24,131. Of those sufficiently advanced to be dealt with at present, the amount is £15,749 which [illegible] £10 for [illegible] £562 for ordinary road repairs and £1,000 to qualify the county for a grant of £3,000 from the Road Board. The [illegible] [illegible] during the past quarter have [illegible] [illegible] The [illegible] work in connection with last year's Road Board grant has been proceeding very slowly owing to unfavourable weather conditions, but it was hoped that it will be completed before the end of next month.

SEWER VENTILATION.

THE REEVES SYSTEM.

In the recently issued report upon the intercepting trap, the Departmental Committee of the Local Government Board pointed out that exceptional conditions may exist under which foul air from sewers may cause a nuisance, even when it is discharged at a considerable height above the ground, as, for example, at the top of ventilating shafts. Under such circumstances, it was considered that intercepting traps would still be required in order to prevent a public nuisance. Three years ago we described in these columns (THE SURVEYOR, June 11, 1909) the new system of ventilators supplied by Mr. R. Harris-Reeves, of Walton-on-the-Naze, Essex, by the use of which the emission of foul gas from sewers may be prevented. Several instances were then quoted where these ventilators had been fixed and had proved entirely successful, even in the case of the unbearable stench due to the discharge into the sewers of the boiling liquid from a bone-boiling works. Since that time further testimony as to the efficiency of the Reeves system has been received. In October, 1910, the Royal Borough of Kensington, after having had three in use for some time, decided to order an additional ventilator, at an estimated cost of £19, with an anticipated annual outlay of £3 10s. for maintenance. One member of the council, replying to an inquiry, stated that the first ventilator, which was fitted up at a very awkward place in South Kensington, "had been found to be a very great success."

A number of residents near a third ventilating column on the London County Council sewer in Dawes Road, Fulham, have, on several occasions, testified to the success of the Reeves ventilator installed there. Prior to its installation there had been an almost constant stench arising from the gratings, but this has been entirely absent since the apparatus was fixed.

Recent orders for these ventilators have been received from the London County Council engineers department, the borough engineer of Lambeth, the engineer of the Water of Leith Purification and Sewerage Commissioners, Edinburgh (a repeat order for four ventilators), and the borough engineer of Hampstead (a repeat order for three sets).

The above quoted evidence as to the practical efficiency of the Reeves system of sewer ventilation will doubtless be interesting and useful to the large number of municipal engineers and others whose attention has been drawn anew to the vexed problem of sewer ventilation by the publication of the report upon the intercepting trap.

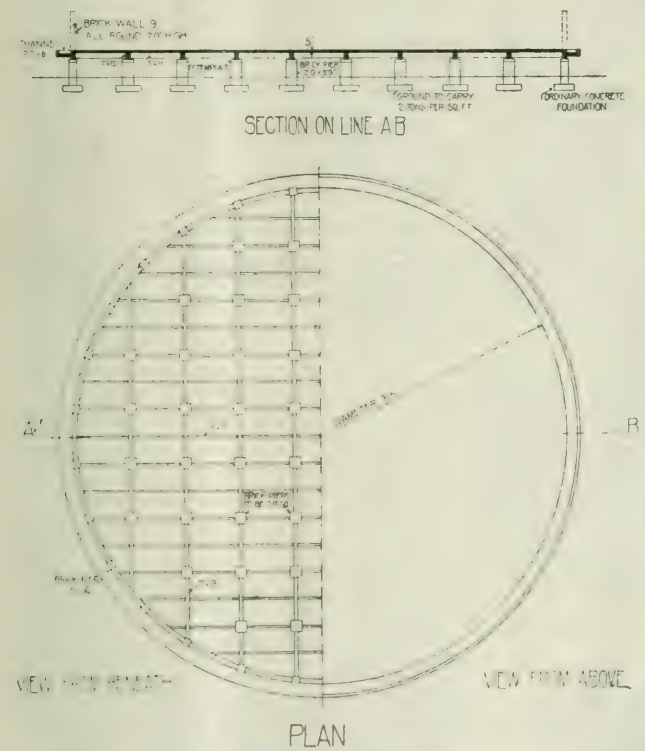

FIG. 5.—Plan and Section of Filter Bed.

HORBURY SEWAGE WORKS.

WOOD SEASONING.

THE POWELL PROCESS.

Having regard to the enormous quantities of wood that are made use of while in an unsatisfactory state for the purposes for which it is employed, some particulars of the Powell process of seasoning and preserving appearing in a pamphlet which has reached us will be read with interest.

In all newly-felled timber, as is well known, there are present the elements of decay and an excess of moisture which render it unfit for use until it has been seasoned. In so-called "natural" seasoning—that is to say, by simple exposure to air—there is no certainty that the process is complete, and the long period required before wood is fit to use necessitates the locking up of a large amount of capital in stocks, as well as the payment of heavy rentals for storage. There is also a serious loss due to wood warping and splitting, owing, in a great measure, to the fact that nothing is put in to take the place of the moisture removed. The Powell process—which, it is claimed, converts sappy "green" timber into dry, firm, seasoned wood within a few days, and at the same time enhances every valuable quality, improving the wood in strength, durability and appearance at small cost—consists essentially in treating the wood in a saccharine solution, otherwise "liquid timber," for which wood has a decided affinity. The solutions vary in composition, and to them are added certain other substances to suit the special purpose for which the wood is required. When the wood has been specially dried the process is complete, and the wood is ready for immediate use. The timber is not subjected to any external pressure or vacuum at any stage of the process; none the less, complete impregnation with the saccharine matter is effected, however hard and close grained the wood under treatment may be.

It will be apparent that the process is one that is specially adapted for the treatment of wood-paving blocks, and municipal engineers desiring further particulars with regard to it may be recommended to communicate with the Powell Wood-Process Syndicate, Limited, 718-719 Salisbury House, London-wall, E.C.

Tar no Improvement. The sewage from certain tarred roads in Newport (Mon.) find their way into the river, and Mr. H. S. Lane, clerk to the Usk Board of Conservators, in a letter of complaint to the Newport Corporation Works Committee, said that the pollution from the town sewage would be had to beat, but he does not consider the tar washings improve the sewage.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

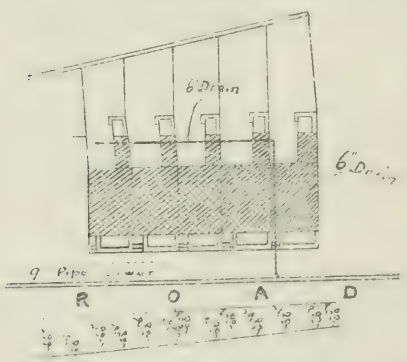
The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

Drainage Works: Obstruction of Access to Shop: Claim for Compensation: Public Health Act, 1875, sec. 308.—The decision of the King's Bench Divisional Court in *Lingke* v. *Christchurch Corporation* (noted at p. 769 of vol. xli.) has been reversed by the Court of Appeal (July 11th). This was an action for compensation for the obstruction of the plaintiff's house and shop by a heap of rubbish and gravel thrown up in the course of the execution of certain drainage works by the corporation. The claim was based on the award of an arbitrator under sec. 308 of the Public Health Act, 1875. The Divisional Court held that the corporation were not liable to pay any compensation, on the ground that the access to the premises had not been interfered with to an unreasonable extent or for an unreasonable time, and that the work had been reasonably and properly carried out. The Court of Appeal, however, were of opinion that, inasmuch as the obstruction was of such a nature that if it had been caused by a private individual the plaintiff would have had a good cause of action against him, the plaintiff could recover against the corporation under the section, which provides that "where any person sustains any damage by reason of the exercise of any of the powers of this Act, in relation to any matter as to which he is not himself in default, full compensation shall be made to such person by the local authority exercising such powers."

QUERIES AND REPLIES.

In order to avoid confusion queriists are requested to use distinctive words as nom de plume. The letter X, combinations such as X Y Z., and words such as "engineer" and "surveyor," should never be used.

Combined Drainage.—"Sewer" writes: The five houses shown on the accompanying tracing belong to one owner, and the 6-in. pipe drain running at the back of the houses is very defective and insufficient for effectual drainage. The owner has been served with notice requiring him to reconstruct the defective drain, but he declines to do it, arguing that the



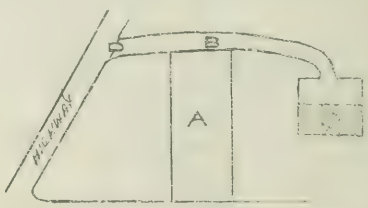
drain from its connection with the 9-in. sewer in the road up to the point where it is receiving the drainage of two houses is a sewer. Seeing the council have a 9-in. sewer in the road, is it necessary for them to recognise this drain at all? The drain is insufficient, and cannot the owner be required to drain each house separately to the sewer? I shall be glad of your opinion on the point.

In my opinion the 6-in. pipe is a sewer from the point at which it receives the drainage of more than one house. Being a sewer the council can no doubt close it under sec. 18 of the Public Health Act, 1875, but any new drains or any work connected with drains thereby rendered necessary would have to be done at the council's expense. See *Marriage (Estate) v. Local Board* [L.M.C. 121; *Vestry of St. Martin in the Fields* v. *Ward* (1881, 7 Q.B.D. 81).

By-Laws. New Street. "Cul-de-sac." "Ultra" writes: Some time ago my council approved a plan similar to the accompanying pencil sketch (not for publication). There is one entrance only to a back street, which is 18 ft. wide throughout, and, as shown, ends in a *cul-de-sac*. The length of the street is 360 ft. The owner of one house was the builder for the whole of the houses, and sold them to the people who now occupy them, and they object to the wall between his premises and the houses, contending that it ought to have been left open so as to have an entrance to the back street at both ends. The above houses are built on the side of the main road, and, owing to the nature of the surface of the ground at the rear, it will be impossible to build any more houses, consequently the 18-ft. street may be regarded as a secondary means of access for the purpose of scavenging, &c. Does this arrangement comply with our by-laws (copy forwarded)?

Assuming that the back street is not intended to form the principal approach or means of access to any building, but is intended for use solely as a separate means of access for the purpose specified in by-law 5, there does not appear to be any contravention of the by-laws. The street is of the width required by by-law 5, and it has an entrance *at one end* equal to the width of the street, as required by by-law 7.

Right of Way.—"Old Subscriber" writes: My client has bought a field A, with a right of way along accommodation road B. The house C was originally a farmhouse, and, with additions, has been converted into a villa residence. This also is approached by accommodation road B. The owner of the villa residence has planted shrubs and trees along the road,



placed a pair of entrance gates (D) at the end, and is now using it as a carriage drive. He does not deny my client's right of way, but contends that it is for agricultural purposes only, although he himself habitually uses it for all kinds of traffic. As my client is desirous of building, will you kindly say if he is entitled to use road B for that purpose?

This depends upon whether the owner of A has a general right of way or a right of way limited to a particular mode of user. If he acquired the right of way under an express grant, the deed of grant would show the nature of the right—*i.e.*, whether it is general or limited. If he acquired it by implied grant or by prescription (*i.e.*, user for a long period) it is impossible to say whether it is general or limited without knowing all the facts, such as the circumstances under which it arose, the mode in which it has been heretofore used, &c.

Telegraph Poles on Highways. "S. R." writes: Will you kindly tell me what power the district council have over the Post Office Telegraph Department fixing poles by the side of public highways? Can they object to the position of a telegraph pole either (1) when it is fixed on a causeway, causing an obstruction to pedestrians, or (2) in the centre of a ditch or dyke which has been formed to take the surplus water?

(1) Under sec. 12 of the Telegraph Act, 1863, posts must not be erected by the Postmaster General on highways without the consent of the highway authority. If consent is not given within twenty-one days after it is requested the matter is to be referred for settlement to a stipendiary magistrate or county court judge, under secs. 3 and 4 of the Telegraph Act, 1878. (2) If the ditch is part of the highway the foregoing sections will apply.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bradford T.C. (August 27th. Major J. Stewart).—£11,000 for the building of an annexe to the municipal baths in Morley-street, £640 for a filtration plant for the West Bowling baths, and £1,459 for the provision of bowling greens at Girlington, Greengates, Idle Recreation Ground, Harold Park, and Edge House Field, Thornton.—With respect to the proposed filtration scheme the inspector was informed by the deputy town clerk that the system was already in operation, and had proved a success, at the Manningham baths. It cleared the water of a peaty appearance and enabled the same water to be used over and over again after it had been purified. The inspector said he did not think that more than ten years could be given for repayment of the loan. With regard to bowling greens Alderman Horsfall said that the Parks Committee had proceeded very cautiously in the matter. They had started with bowling greens in the parks nearer to the centre of the city, and now they were extending to the suburbs. They were so well appreciated that the committee were simply meeting a popular demand.

Cannock U.D.C. (August 30th. Mr. Courtenay Clifton).—£4 240 for the purposes of the making, channelling, and paving of certain new streets.—Mr. R. Blanchard, surveyor, said that there were over 56 miles of road in the urban area. Of those 27 miles were paved and channelled. The new scheme embraced 11¼ miles. It was hoped to carry out the work within the next two years. Probably it would extend to three years. He would be thankful if the board could allow an extra 10 per cent for contingencies. The price of bricks and tiles had risen by 15 per cent, and further rises might occur.

Mallow U.D.C. (August 29th. Mr. A. D. Price).—£800 for the purpose of providing working capital in connection with the gasworks which they have acquired recently.—It was stated that the amount of the entire loan for the purchase of the gasworks was £12,000, of which £10,000 was repayable in thirty-five years and £2,000 in five years. The council borrowed the money at 4 per cent, and paid a negotiation fee of 2 per cent. The present price of gas was 5s. 3d.; the maximum price was 5s. 9d. There was nothing to prevent the council from raising the price of gas to 5s. 9d. for the first few years to meet the deficit. It would have to be brought up to that for the first five years. After ten years it would be possible to bring the price of gas under 5s. 3d., so that one would balance the other.

Salford T.C. (August 26th. Mr. H. Shelford Bidwell).—£1,084 for sewerage work in Eccles New-road, Pendleton, and £830 for the purpose of acquiring a piece of land adjoining Bolton-road and Eccles Old-road, Pendleton, with a view to making a new road.—Mr. J. Corbett, borough engineer, explained that the proposed new sewer would discharge into the sewage works. He proceeded to say that if that piece of land was made it would provide a splendid route to the docks. The heavy motor traffic had now to go a roundabout way and damaged the roads.

Shrewsbury T.C. (August 28th. Mr. H. Shelford Bidwell).—£12 000 for the widening of the English Bridge. It was explained that at present the bridge was exceeding... [illegible] was altogether unsuitable for present-day requirements, and the greatest possible care was necessary to direct traffic over the bridge.

Stone (Staffs) U.D.C. (August 23rd. Mr. Edgar Dudley).—£592 for the purchase of six cottages in North-street, for the purpose of street widening.—Mr. S. Watson (clerk) presented the case for the council, together with Mr. A. R. Ridout (surveyor). North-street, it was explained, is the principal street from the station to the town and is used by heavy traffic from both breweries and from a timber yard, while there is also considerable motor traffic to and from the station. The present width of the street varied from 16 ft. to 30 ft., while the new roadway, when the improvement was effected, would have an average width of 40 ft.

West Ham T.C. (August 24th. Mr. W. O. E. Meade-King).—£12 430 for the provision of public baths at Oriental-road, Silvertown; and a further sum of £1,030 for the extension of the council offices at The Grove, Stratford.—The loan for the extension of the municipal offices, which was first dealt with, was in respect of supplemental requirements. It was stated that the largest item in the account (£680) was due to the increased cost of building material. As to the proposed loan for public baths, the deputy town clerk, Mr. G. E. Hilleary, said the council desired a sixty years' loan of the price of the land, amounting to £430, and thirty years for the building. The land was situated in Silvertown, near St. Mark's Church, and the area was about 1,200 sq. yds. The frontage was 113 ft. 10 in., and the depth from 89 ft. 3 in. to 97 ft. 6 in. The borough surveyor, Mr. J. G. Morley, said the council had previously agreed to purchase a similar site for £680, but the negotiations fell through. Subsequently the present site was offered, and the result was that it was purchased for £380, or less than £4 per foot frontage. The £430 included the purchase price, surveyor's fees, investigation of the title and other charges.

APPLICATIONS FOR LOANS.

Cuckfield U.D.C.—£625 for the purchase of a site for industrial dwellings.

Dover T.C.—£580 for works of road widening.

Halifax T.C.—£11,812 for paving works with granite setts.

Haworth U.D.C.—£1,350 for alterations to Sowden's Farm.

Keighley and Bingley Joint Hospital Board.—£3,000 for a cubicle isolation pavilion.

Leeds T.C.—£7,837 for sewage disposal works.

Scarborough T.C.—£3,020 for public conveniences and shelters.

Stockport T.C.—£15,000 for new police buildings.

Stourport U.D.C.—£1,400 for the construction of water mains.

Wigan T.C.—£9,000 for new gas meters.

LOANS SANCTIONED.

Antrim R.D.C.—£3,570 for a housing scheme.

Bacup T.C.—£8,200 for water supply purposes.

Barnsley T.C.—£2,000 for wood paving works.

Bridlington R.D.C.—£260 for extending water mains.

Chester-le-Street R.D.C.—£2,400 for a pavilion at the infectious diseases hospital.

Congleton R.D.C.—£1,241 for sewage disposal works, £1,000 for cookers and meters (for ten years), and £700 for retorts (for fifteen years).

Guildford T.C.—£800 for road improvement works for sixty years.

Hunstanton U.D.C.—£803 (for twenty years) for shelters and a bandstand.

Kenilworth U.D.C.—£3,700 for laying out a burial ground.

Spennymoor U.D.C.—£23,000 for a sewage disposal scheme.

Warminster U.D.C.—£780 for improving main road footpaths.

Wolverhampton T.C.—£11,690 for a new school.

Worthing T.C.—£3,770 for electricity extensions.

Yeovil R.D.C.—£550 (for thirty years) for sewerage and sewage disposal works.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Abercarn, Barnsley, Cardiff £50,000, Essex £42,000, Newport (Mon.), Torquay, £15,000; housing and town planning—Altrincham, Blackburn, Shrewsbury; refuse collection and disposal—Colwyn Bay, roads and materials—Shoreditch, Waterlooswith-Seaforth; sewerage and sewage disposal—Leeds, Marple, Spennymoor £23,000; water, gas and electricity—Bangor, Dunbar.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

ADMINISTRATION.

Preesall U.D.C.—A resolution, passed in 1909, that the surveyor be in an adjoining room during the meetings of the council until called upon to explain any matters that might arise, has been rescinded by the casting vote of the chairman.

BUILDINGS.

Abercarn U.D.C.—The Sanitary Committee has been requested to consider the question of providing a public abattoir.

Ashton-under-Lyne T.C.—A new school has been completed, at a cost of £18,000, from designs by Mr. E. Woodhouse.

Barnsley T.C.—The provision of municipal offices and a town hall has been referred to a committee of the council.

Belfast T.C.—The provision of a site for a new electricity station is under the consideration of a committee.

Bourne R.D.C.—A consumptive shelter is to be provided at a cost of £350.

Builth Wells U.D.C.—The tender of Mr. S. Speake, at £213, has been accepted for building a fire station.

Cardiff T.C.—It is proposed to build a technical school in Cathays Park at an estimated cost of £50,000

Durham T.C.—A scheme for the provision of workmen's dwellings has received the approval of the council.

Erpingham R.D.C.—It has been ascertained that the bridge restoration work rendered necessary by the floods is estimated to cost £1,000. The council have asked the Local Government Board to sanction a loan to cover this and to expedite matters as much as possible.

Essex C.C.—Plans have been approved of new county buildings to be erected at Chelmsford at an estimated cost of £42,000.

Herne Bay U.D.C.—The East Cliff pavilion is to be enlarged by the addition of a concert hall and an amphitheatre.

Louth T.C.—A proposal is under consideration for building a public bath on the site of the skating rink on Ramsgate-road, at a cost, exclusive of the site, of £650.

Newport (Mon.) T.C.—The borough architect is preparing plans for a new town hall.

Northwich U.D.C.—The tender of Mr. Thomas Astles, of Northwich, at £7,850, has been accepted for the erection of public baths.

Poole T.C.—The tender of Mr. H. W. King, at £670, has been accepted for a new disinfector, a mortuary, and alterations to the laundry at the Alderney isolation hospital.

Rhyl U.D.C.—The council on Monday last confirmed the Finance Committee's resolution on the question of the future of the pier. The result was that the resolution passed last April, adopting the modified scheme at a cost of £52,780, is rescinded, and the council renew their application for sanction to borrow £7,500 to buy the pier as it stands.

Teignmouth U.D.C.—Plans have been prepared for the extension of the sea-wall and the erection of a groyne, at an estimated cost of £2,100.

Torquay T.C.—Medical baths and a swimming bath are to be provided at an estimated cost of £15,000.

HOUSING AND TOWN PLANNING.

Altrincham U.D.C.—The surveyor, Mr. H. E. Brown, has prepared the plans of a scheme for the provision of fifty-six houses, which the council have adopted.

Blackburn T.C.—The council have approved a town planning scheme embracing an extensive residential area covering several miles.

Falmouth T.C.—The borough surveyor, Mr. J. S. Walton, has received instructions to prepare detailed plans and specifications for the twenty-two artisans' dwellings which it is proposed to build on the Trevethan site, with a view to tenders being obtained.

Leek U.D.C.—The surveyor, Mr. W. E. Beacham, has received instructions to prepare an estimate for a housing scheme.

Morpeth T.C.—The tender of Mr. G. Douglas, of Newcastle-on-Tyne, at £5,855, has been accepted for the erection of thirty-three workmen's dwellings.

Pollokshaws T.C.—A committee has been appointed to interview a committee of the Glasgow Corporation (Pollokshaws having been annexed to Glasgow recently) with respect to the scheme for building three tenements on ground belonging to the burgh in Factory-street and M'Arthur-street, at a cost of between £8,000 and £10,000.

Shrewsbury T.C.—The preliminary details have been prepared of an extensive town-planning scheme to cover 138 acres, entirely in the country, though quite near the town, and it has been agreed to serve the necessary notice on the owners of the properties of the proposed application to the Local Government Board for authority to promote the scheme.

Sidmouth U.D.C.—The Local Government Board called some time ago the attention of the council to the fact that more suitable accommodation was wanted for the working classes, and asked what had been done in the matter. Mr. Michelmore said that a reply had been sent that the council had been unable to secure suitable land at a reasonable price. The board replied that if so the council should consider taking compulsory measures to procure accommodation. The matter has been referred to the General Purposes Committee.

Swaffham R.D.C.—A special meeting is to be held in a month to consider a letter from the Local Government Board in which they state they are advised by their inspector, Mr. W. H. Collin, that additional accommodation was immediately required in the parishes of Great Cressingham, Holme Hale, and North Pickenham. The information before them went to show that there was no prospect of the required accommodation being provided by private enterprise, and they considered that the council should at once proceed with the preparation of schemes, under Part III. of the Housing Act, 1890, for the erection of six houses in each of these parishes. They were also advised that such houses should consist each of a large living-room, three good bedrooms, a scullery (with copper), a food larder and coal-store, and a pail closet placed at a suitable distance from the house). These houses might be erected in blocks of six.

Walthamstow U.D.C.—It is stated that the Local Government Board have given authority for the preparation of a town-planning scheme by the council. The proposals apply to various areas situated within the urban district.

PARKS AND OPEN SPACES.

Felixstowe U.D.C.—Schemes and designs are being invited for dealing with Hamilton Cliffs and the "enclosed beach" from Swiss Cottage to Cliff House fence. A prize of 50 guineas is offered for the accepted scheme and a prize of 20 guineas for the next best scheme.

Llandudno U.D.C.—The deputy surveyor has been requested to prepare a plan and estimate for levelling, excavating, filling, turfing, and seeding the promenade from Penmorfa to Dale-street; also an estimate for the proposed extension of the yacht pond.

Rutherglen T.C.—The public bowling greens have been so successful during the past season that it has been decided to form two new greens.

REFUSE COLLECTION AND DISPOSAL.

Colwyn Bay U.D.C.—A refuse destructor is to be built on the land between the railway and the cemetery. Mr. William Jones, engineer to the council, in a report

on the matter, advised that the system to be adopted should be the continuous grate type of construction, with back feed. Mr. Jones estimates the cost of burning at ¾d. per ton, inclusive of renewals, repairs, and maintenance, as compared with 5·24d. per ton, the present cost of disposal on the tips.

Shoreditch B.C.—The refuse destructor account shows a nett charge on rate account of £5,869, including loan charges, the cost of cartage of clinker having been increased by 6d. per ton. From 28,408 tons of refuse destroyed, 729,745 units of electricity were generated, for which the department paid £1 167.

ROADS AND MATERIALS.

Brandon and Byshottles U.D.C.—Back Bowdney-lane is to be made up, at a cost of £514.

Brentford U.D.C.—The council have received a letter from the Road Board stating that the board had considered the suggestion of the council that an alternative to the new road to the north of Brentford would be the widening of the existing Brentford High-street. The board had obtained approximate estimates of the difference in the additional cost as compared with the construction of the new road, and found it would be £350,000. That would appear to place the matter beyond doubt. The board, however, would be prepared to meet representatives of the council and discuss the matter. Mr. Dorey said the board were absolutely at sea when they talked about £350,000 extra. It was decided to submit dates on which the council's committee would wait on the Road Board.

Clydebank T.C.—It has been agreed to widen Dumbarton-road, at an estimated cost of £1,487.

Hursley (Hants) R.D.C.—The surveyor, Mr. H. C. Phillips, has presented a statement showing that an expenditure of £1,100 would be necessary in order to overtake a fair proportion of the arrears of work on the roads. The council in the circumstances have agreed to an excess expenditure of £355 upon road improvement works, including steam rolling.

Larne U.D.C.—Steps are to be taken to purchase property necessary for the widening of Cooper's-lane.

Leek U.D.C.—A sum of £275 is to be spent on improvements in Ashbourne-road.

Lynton U.D.C. It has been decided to proceed with the construction of a new road over Lyn Down, and a road from the Rookery to a spot below Park Derry, thereby giving a direct road to the station, provided contributions are received from the Road Board and the county council.

Malvern U.D.C.—It was reported at the meeting last week that representatives of the council had conferred with members of the Highways and Bridges Committee of the county council with reference to the damage caused to the roads in the district from traction traffic and the unsuitable material. It was suggested that the Local Government Board should be asked to confirm a by-law authorising the laying of any road which under repair, and for such further period as might be necessary for the material to get thoroughly set before putting it again to traction traffic. During the conference a point was raised as to making a special road for traction traffic at the, leading from Little Malvern Quarry to the Midland Railway Station, by opening up an old road which existed years ago. This road, it was stated, had been known as Cook Hore-shire, but there was no trace of it on the present ordnance sheets. The Malvern Council undertook to look into the question and to inform the county authority as to the result of their researches. The chairman of the county council desired information as to the number of times the traction traffic passed a given point each day. It was understood that when this information was obtained the county council would consider the whole matter.

Nottingham T.C.—A scheme has been adopted for widening Hucknall-road for a distance of 2,400 ft., at the cost for the purchase of lands of £860.

Oxford T.C.—A scheme of street improvement, to cost £504, has been approved.

Saltash T.C.—A scheme is being promoted for the extension of the town quay.

Shoreditch B.C.—It is proposed to proceed with the remainder of the scheme for the widening of Hoxton-street to a width of 40 ft. for a length of 220 ft., and the London County Council has been asked to contribute a proportion of the cost, estimated at £14,368.

Sunbury U.D.C.—For steam rolling and road scarifying the tender of Messrs. E. Parry & Co., of Putney, has been accepted at 2s. 11d. per day for rolling, and ¾d. per yard for scarifying.

Teignmouth U.D.C.—Levelling operations are to be carried out at the Den, at an estimated cost of £420.

Waterloo-with-Seaforth U.D.C.—Property of the value of £10,750 is to be purchased for the purpose of road improvements.

SEWERAGE AND SEWAGE DISPOSAL.

Barnet U.D.C.—Drainage works, costing £118, are to be carried out.

Bucklow R.D.C.—A sewerage scheme is to be carried out at Plover Superior, at an estimated cost of £300.

Docking R.D.C. Surface drainage works are to be carried out at Brancaster.

East Cowes R.D.C.—A sewer is to be laid in Maresfield-road, at a cost of £135.

Leeds T.C.—The council have adopted a resolution of the Sewerage Committee authorising them to acquire from Colonel Spencer-Stanhope an area of 10 acres of land adjoining the existing Rodley sewage works, and approved of the plans submitted by the sewerage engineer, Mr. G. A. Hart, for additional sewage tank accommodation, the diversion and enlargement of the existing Rodley main outfall sewer, also additional tanks for the treatment of storm-water, and to under-drain 30 acres of the sewage farm lands. Tenders are also to be invited for the construction of the portion of the proposed high-level intercepting sewer, commencing on the new sewage works estate near Thorpe Stapleton, and terminating in Meanwood-road, together with the necessary branch sewers, the total length being 4½ miles, in accordance with the plans submitted by the sewerage engineer. The sewerage engineer has also been instructed to prepare and submit an estimate of the cost of carrying out the work by administration. The corporation secured Parliamentary powers to construct this sewer by special Act in 1908, as a necessary part of the scheme for the extension of the sewage disposal works at Knostrop, sanction to borrow £1,277,000 being obtained.

Marple U.D.C.—Consideration is being given to a sewage disposal scheme for Low Marple, which is estimated to cost £3,000.

Oldham T.C.—Dr. Wilkinson, medical officer of health, in his annual report, states that during 1911 there were 1,089 pan-closets converted to water-closets, and at the close of the year there were in the town 5,295 sanitary pans, 21,521 waste-water closets, and, including latrines, 7,480 slop-water closets. The resolution passed by the council two or three years since that wherever possible each house should have separate closet accommodation is being gradually carried out. For many years no new houses have been allowed to be built without having each a separate closet.

Oulton Broad U.D.C.—A letter has been received from the Local Government Board pointing out that the council would be incurring serious liability by declaring to provide a drainage scheme and, as to the financial aspect, the council could consider what portion of such scheme might be declared. As a result of this letter the Drainage Committee have been authorised to obtain a preliminary report as to the best means of draining the district.

Spennymoor U.D.C.—The sewage disposal scheme, estimated to cost £23,000, which has received the sanction of the Local Government Board, is to be carried out under the direction of Mr. C. Franklin Murphy, of Morpeth.

WATER, GAS, AND ELECTRICITY.

Bangor U.D.C. The question of the introduction of electric lighting is to be brought before the council.

Birkenhead T.C.—Terms have been agreed upon by the special sub-committee appointed by the Water Committee in connection with the carrying out of the provisions of the water scheme for the acquisition by the corporation of land required near Thingwall for the proposed Cross Hill tanks, and easements for the aqueduct to Birkenhead.

Dudley T.C.—It was decided on Tuesday night to sell the electrical undertaking to the district tramway organisation. The works, costing £98,000 were opened in 1899, and the council are now faced with an annual loss of £1,000, partly through the result of an arbitration regarding charges for current to the tramways, and partly through the plant becoming obsolete. The

purchasers, who take over the concern as from last March, undertake to maintain the present rates for current for three years.

Dunbar T.C.—Land costing £21,000 is to be purchased for the construction of a service reservoir.

Exeter T.C.—The water undertaking during the past year yielded a nett surplus of £1,292, and the electricity undertaking showed a profit of £1,431.

Gourock T.C.—Satisfactory borings have been made in connection with the proposed new reservoir at Daff Burn.

Ludlow T.C.—The Watch Committee are considering the advisability of installing a system of automatic lighting and extinguishing.

Settle R.D.C.—The water main is to be extended at a cost of £600.

Shoreditch B.C.—Owing to the reduction in the price of current to consumers and the higher cost of coal due to strikes, the nett surplus on the year's working of the electricity undertaking was reduced from £6,810 in 1910-11 to £5,328.

Stourport U.D.C.—Steps are to be taken to obtain a water supply from Bewdley by laying the necessary pipes at a cost of about £1,400. At present water is obtained from the Kidderminster Corporation at a charge of 6d. per 1,000 gallons. The charge for the water from Bewdley is to be 5d. per 1,000 gallons.

MISCELLANEOUS.

Ayr T.C. The surplus balance upon the past year's working of the tramways was £3,214.

Darlington R.D.C.—The tender of Messrs. Ord & Maddison, at £250, has been accepted for the supply of a mechanical dryer for the slag works.

Harrogate T.C.—Despite the adverse weather at Harrogate last month, the municipal enterprises have yielded most satisfactory results, the receipts showing large increases in every department.

Little Lever (Lancs) U.D.C.—The surveyor of highways, Mr. G. Seddon, has made an inspection of all the disused pit shafts and open ponds in the district, and the council have decided to serve notices that dangerous places must be safely fenced off.

PERSONAL.

Mr. J. W. Liversedge, surveyor to the Leigh (Essex) Urban District Council, has had his salary raised £25 per annum.

Mr. F. B. Lewis, who has been associated with the Corporation of Nottingham for a very long period as city architect, has sent in his resignation

Mr. A. J. Martin, M.INST.C.E., has been appointed by the Orsett Rural District Council assessor to judge the competitive schemes for the sewerage of the parish of South Ockendon.

Mr. Francis F. Longley, A.M.AM. AND CAM.SOCS.C.E., has been admitted to partnership in the firm of Hazen & Whipple, consulting civil engineers, 103 Park-avenue, New York.

Mr. John Thomas Eayrs, M.INST.C.E., of West Bromwich, president of the Institution of Municipal and County Engineers from 1893-4, and formerly borough surveyor of West Bromwich, left estate valued at £17,061, with nett personalty £9,428.

Mr. J. Diggle, borough surveyor of Hyde, has been voted an increased salary of £102 per annum. When the borough surveyor was appointed the corporation engaged a consulting engineer at a salary of £150 a year. This engagement recently expired.

BOROUGH OF SOUTHEND-ON-SEA.

PUMPING STATION AND DESTRUCTOR BUILDINGS, INCLINED ROADWAY, TWO COTTAGES AND OTHER WORKS.

TO BUILDERS AND CONTRACTORS

The Corporation of Southend-on-Sea is prepared to receive Tenders for the Erection of Pumping Station and Destructor Buildings, Inclined Roadway, Two Cottages and other works at the Sewage Disposal Works, Prittlewell, Southend-on-Sea.

Plans and Sections may be seen, Specification, Bill of Quantities and Form of Tender obtained, upon application to the Engineer, Mr. Ernest J. Elford, M.INST.C.E., Municipal Buildings, Clarence-road, Southend-on-Sea, on and after Monday, 16th September, on payment of a deposit of Five Guineas, which will be returned on receipt of a *bonâ fide* Tender upon the form supplied, and the return of all documents. In the event of a Tender being accepted the Five Guineas deposited will be retained until after the signing of the Contract, and will be forfeited should the Contractor withdraw his Tender, or refuse or fail to execute the Contract

Sealed Tenders, endorsed "Pumping Station and Destructor Buildings," to be delivered at my office on or before 12 o'clock noon on Wednesday, October 2, 1912.

No Tender will be considered unless made on the prescribed form.

The Corporation do not bind themselves to accept the lowest or any Tender.

(By order)
H. J. WORWOOD.
Town Clerk.

Town Clerk's Office,
Southend-on-Sea.
September 10, 1912.

BOROUGH OF KINGSTON-UPON-THAMES.
SULPHURIC ACID.

The Corporation invite Tenders for the Supply during the ensuing twelve months of about 300 tons of 80 per cent Sulphuric Acid for their Sewage Works.

Further particulars and Forms of Tender may be obtained of the Borough Surveyor, Mr. R. Hampton Clucas, at the Municipal Offices.

Sealed Tenders, endorsed "Sulphuric Acid," to be delivered at this office not later than Saturday, the 28th September, 1912.

The lowest or any Tender will not necessarily be accepted.

HAROLD A. WINSER,
Town Clerk.

Municipal Offices,
Kingston-upon-Thames.
September 12, 1912.

CORPORATION OF CALCUTTA.
CITY ARCHITECT AND SURVEYOR.

Applications are invited for the post of City Architect and Surveyor to the Corporation of Calcutta on a salary of Rs. 1,350, equivalent to about £90, per month inclusive of travelling and other allowances. The duties of the post will be to (*a*) design and superintend the construction of all Municipal buildings; (*b*) generally supervise the Building Department and give advice regarding plans to which objection has been taken; (*c*) personally sanction and check the construction in cases of large and important buildings; (*d*) control and advise on the general scheme of architecture throughout the town, with a view to securing harmony of design, dealing incidentally with questions of town planning, street improvement, &c., and (*e*) to perform the duties incident to his post as Municipal Surveyor.

The appointment is subject to the Provident Fund, leave and other service rules of the Corporation and may be terminated at any time by six months' notice being given on either side. The selected candidate will be required to devote his whole time to the duties of his office and will not be allowed to take up any outside work. He will be required to submit to a medical examination before joining his appointment. The Corporation will pay his passage (1st class) from London. He will be required to take up his appointment by about the 1st January, 1913.

Applications will be received in England by the Honourable Mr. S. L. Maddox, C.S.I., I.C.S., Chairman of the Corporation of Calcutta, East India United Service Club, 16 St. James' Square, London, S.W., up to the 28th inst.

Applications will also be received in India by the undersigned up to the 1st November, 1912.

C. C. CHATTERJEE,
Secretary,
Corporation of Calcutta.

August 19, 1912.

Mid-Lothian Roads.

COUNTY SURVEYOR'S REPORT.

In his annual report to the County Road Board on the state of the roads in Mid-Lothian, and on the expenditure for the year to May 15th last, Mr. John Robb, county surveyor, states that the total quantity of metal quarried and paid for was 96,072 tons or cubic yards, as against 92,777 last year. The excess of 14,408 tons of materials quarried and paid for beyond the original estimates was in order to provide an adequate supply of gravel and small materials required for tar work during the ensuing year, authority having been obtained to continue quarrying and breaking beyond the estimated quantity. This, to some extent, accounts for the large excess of materials produced, but it is also attributable to the great quantities of bottoming used in widening and reconstruction authorised under the Road Board grants. The gravel required cannot yet be produced with the existing plant, and large quantities have to be obtained from sale quarries at enhanced prices.

QUARRYING.

The Town Council of Edinburgh and the county council submitted a special case to the Court of Session regarding Blackford Quarry, and the decision was to the effect that the county council are entitled to quarry stone from the ground belonging to Colonel Trotter, of Mortonhall, within the city boundaries, and to carry stone from that ground over the ground belonging to the corporation, but that they had no statutory authority to lay down over the city property a tramway for the transport of stone taken from Colonel Trotter's ground. The joint sub-committee in charge of Blackford Quarry thereafter entered into negotiations with Colonel Trotter's agents for the acquisition of 2 acres of additional ground on his property for quarrying purposes, and on this being agreed to instructions were given to proceed as soon as possible with the erection of the stone-breaking machinery on the ground leased from Colonel Gordon Gilmour. A twenty-one years' lease was accordingly entered into for two additional acres of ground, at a rent of £90 per annum, so long as materials are taken from the ground, and £15 per annum in perpetuity for surface damage.

The formation of a tramway and winding gear being disallowed, considerable surplus power was available in the suction-gas plant, and the joint sub-committee considered the question of utilising this for boring by compressed air, instead of by steam as formerly. Estimates were obtained for the best kind of compressors and rock drills for this purpose, and the county surveyor visited the new Naval Base at Rosyth and Hailes Quarry, where a large number of hand hammer drills were in use. The economy in boring by this method is, says Mr. Robb, quite apparent, and the joint sub-committee decided to purchase an air compressor and one hand hammer drill, with the necessary piping required, at a cost of £265. This machinery has only been in operation for a short period, and the cost of working cannot yet be determined.

The erection of the new breaking machinery was continued after the settlement of the case with the city of Edinburgh, but the deletion of that part of the scheme which included the tramway to the quarry necessitated the lowering of the screening apparatus, so that an easy cart road to the feeding platform could be formed, and a very good working arrangement has now been secured.

The sample of metal produced, owing to the introduction of bar screens for extracting the flaky pieces of stones, is much superior to what was anticipated, and cannot be distinguished from hand-broken metal. Although the percentage of small flaky stones taken out is high, this was to be expected from such a brittle rock as that from Blackford Quarry. It is proposed to put this residue material through a granulating machine to produce small gravel for tar work purposes. The altered arrangement necessitated elevating to the top screens all the materials broken, and in consequence the fine dust produced is troublesome during high winds. A scheme for extracting and collecting the dust is being considered by the joint sub-committee.

The power provided for working the proposed tramway is now utilised in driving the air compressor, and there is still sufficient margin of power remaining to drive the tar-mixing plant and the granulator before referred to, should the district committees adopt these in the future.

As most of the operations in working the existing and suggested plant could be automatically carried out, the cost of production would be very much lower than is paid at present for prepared tar materials from private quarries. The cost of breaking per ton during the limited period the machines have been at work is about the same as at the other quarries, but a proper comparison cannot be made until the completion of a full year's work.

The total expenditure on the works, including alterations up to May 15th, 1912, amounts to £3,642, and is equally divided between the Suburban and Lasswade District Committees.

MAINTENANCE.

The roads in the county have been well maintained throughout the year, and, with the continued aid of the Road Board grants, it is hoped that the expenditure proposed in the estimates submitted by the four District Committees to the County Road Board will prove sufficient for ordinary needs during the ensuing year. It will be noted that the road assessment is not increased in any of the districts except the suburban, where an addition of 1d. per £ is required, but this is accounted for by the loss in valuation of the Leith Docks, the reduction in the Road Board grant, and the increased prices for carting.

The weather throughout the year was generally dry and favourable for maintenance, and was very suitable for the carrying out of tar work.

The reconstruction of the Pathhead and Soutrahill-road, and the Gala-Water-road, was continued successfully, after the new rolling and traction plant was obtained. The extra expenditure allowed, and high-class metal applied to both these roads, is making a marked improvement. Those sections, however, remaining to be dealt with are showing the destructive effect of motor-car traffic on weak surfaces, and it is now quite obvious that this particularly large increase in expenditure was urgently required.

The cost of snow cutting was practically *nil* throughout the whole county, and, as shown, very little extra expenditure was incurred under this head.

Considerable delay occurred in settling the question between the Road Board and highway authorities generally as to the method of allocating the grants under the Development and Road Improvement Funds Act, 1909, and previous to this instructions had been given to proceed with the work on account of the favourable weather at the time. On finally stating the amount of the grant, the Road Board intimated that only 1d. per square yard for tar spraying or painting, instead of 1·75d. as estimated, would be allowed, and the cost of the work in carrying out tar-spraying on 36 miles, at 1·73d. per square yard, was £2,750, and on pitch-grouting, about 11·2 miles, at 7·6d. per square yard, was £4,355 over water-bound macadam.

The claims for grants for 1912-13 amounted to £13,703, and were made up on similar lines to those of the previous year, but the Road Board state that sums available for distribution would be much less than last year, and that £4,500 only had been allowed to Mid-Lothian.

The committee have addressed the Road Board urging the necessity of an increased grant, and have also recommended to them an application from the Suburban District Committee for a special grant towards the construction of a new bridge over the Water of Leith at Colinton, estimated to cost £7,000.

The results obtained from tar-spraying were generally very satisfactory, although several complaints were made regarding the slipperiness of the surface. The sub-committee, on inquiring into this matter, desired to point out that great benefit had resulted from tar-spraying, which had practically abolished the dust nuisance on the main roads so treated, while it also had effected a considerable saving in wear.

The continued drought during the summer, and an insufficient supply of gravel, tended to make the roads more slippery than under normal conditions. Instructions were given to provide for an adequate supply of gravel for the ensuing year's work, and that in the vicinity of all gradients on tar-sprayed

roads small heaps of gravel should be put down, to be applied by the roadmen when necessary, and as far as possible, without incurring extraordinary expenditure, this was given effect to.

The weather was exceptionally favourable during the month of May last, and with three of "Aitken's" spraying machines, and the tar plant in possession of the District Committees, the spraying was carried out rapidly at about the same price per square yard as last year, notwithstanding the rise in the price of tar. It was, however, thought advisable to apply a slightly thinner coating than previously, so that the tar might be exhausted before winter, as after the effects of frost the cost of labour in scraping was materially increased.

On outlying roads subjected to fast-going motor traffic the prevention by tar-spraying of the ravelling of the surface, in Mr. Robb's opinion, more than compensates for the wear which formerly took place.

In the month of June last Sir George Gibb, and several members of the Advisory Committee of the Road Board, inspected roads in this and other counties, for the improvement of which grants were given. In view of the very small cost, varying from 9d. down to 5d. per square yard, at which water-bound macadam could be renewed in many counties in Scotland, they expressed the opinion that the treatment for county roads for dust prevention, except where traffic was heavy, was surface tarring, rather than the more expensive methods of tar-macadam or pitch-grouting.

Following the completion of tar-spraying, pitch-grouting for the year 1911-12 was completed by September 9th.

Of the 12 miles of roads proposed to be pitch-grouted, several sections, extending altogether to about 1 mile in length, were not carried out on account of the increase in the cost of tar and gravel previously referred to. With the exception of a few parts, the whole of this work was satisfactory, and although roads so treated cannot be said to be dustless, the amount of dust produced is comparatively small, and the superiority of the surface, compared to that of ordinary water-bound macadam, is distinct, especially in wet weather and after thaws in winter. On the portions so treated very little expenditure was incurred for surface labour throughout the winter, as there was practically no mud, but from a sanitary point of view tarred surfaces require more cleansing.

The county surveyor is still of opinion that this system is the best yet devised for tarring county roads, and is the most suitable for all kinds of heavy traffic.

Several members of the Advisory Committee to the Road Board suggested that in renewing the surface the interstices should be keyed by smaller-sized metal, such as is now being produced at Blackford by machinery, and that this should be sealed by tar-spraying and a covering of gravel to render it dustless, and prolong the life of the road by making it thoroughly waterproof. They also agreed with the opinion of the sub-committee, that both horses and drivers would gradually become more accustomed to the altered condition of the roads. It is proposed to give effect to the above suggestions on some of the sections now being carried out.

As it was obvious that many improvements could be effected on the method of hand pouring the boiling pitch, Mr. Robb devised a system of grouting pipes, attached to the boilers, by which the hot mixture could be sprayed direct into the metal. The District Committees approved of this, and purchased ten new boilers, of 570 gallons capacity each, in addition to the existing plant. With these machines and boilers, drawn by a tractor or roller, as much grouting can be done in five minutes with one man in attendance as three men could do formerly by hand labour in one hour. These machines can also be used for surface spraying. As grouting can only be successfully accomplished in dry weather the necessity for having sufficient plant, and quick handling, can be readily understood.

Although the delivery of the boilers was long delayed on account of the coal strike, a considerable part of the work for the year was begun in the middle of May, and continued steadily on for some time. Owing to the continuous wet weather since the beginning of June, the work of grouting has been hampered to a very great extent, and it is doubtful if it will prove so satisfactory as that of last year.

The several short stretches of tar-macadam laid down with prepared tarred materials in five villages have stood very well, and as long as the surface is not made too smooth, this method of maintenance may be extended to roads where traffic is not heavy at very little extra cost over that of grouting. It has the advantage over grouting that it can be laid in damp weather. No tar-macadam has yet been laid on any heavy-traffic roads in the city, and Mr. Robb is informed by the city surveyor that on the asphalt and tar-macadam laid on the side streets on the west end of Edinburgh, which are superior examples of road construction, sanding has to be resorted to on every frosty morning.

A section of road through Corstorphine village laid with Rocmac over two years ago is still in very good order, and the material has proved to be a durable binder. A considerable amount of dust rises from it in dry weather with heavy fast-going traffic, and it was found desirable to tar-spray the section referred to in the spring of this year. "On the other hand," says Mr. Robb, "Rocmac produces comparative little mud in winter, and judging from several fine examples of county roads laid with this material which I have inspected during the past year, I am confirmed in my opinion that Rocmac can be successfully used in damp situations."

The tarring of footpaths during the past year has given general satisfaction, and where the surfaces were in good condition tar-painting only was resorted to in the meantime, but tar matrix was applied to those portions which were uneven or required remaking. An extension of this work is now proposed in all the districts, and the county surveyor confidently recommends its adoption, particularly in populous neighbourhoods.

MOTOR TRAFFIC.

The Road Board requires a census of the traffic on each of the roads in the county towards the improvement of which a grant is made, and desires that the figures be taken for a week in summer and for a week in winter, for seven consecutive days, between the hours of 6 a.m. and 10 p.m. This was done in the beginning of August last year, and by instructions of the County Road Board was repeated this year. An extract from the census of the daily traffic in tons for both years shows that, although the total tonnage is practically the same, the total daily average of motor vehicles is increased by 1,800 tons, while the horse and other traffic has decreased.

Motor traffic on fourteen main roads converging towards Edinburgh is now 56 per cent of all vehicular traffic. The heaviest traffic is on the Corstorphine or Glasgow road, with 1,489 tons per day, while several other roads exceed 1,000 tons per day.

EXPENDITURE.

Exclusive of improvements, establishment charges, repayment of capital and interest on capital works, and sums received for materials sold, the nett expenditure on maintenance amounted to £49,316, against £41,286 last year, and the cost per mile for the year is now, in the Suburban District, £211, against £149 on the average of the last five years, in the Calder District £70, against £59, in the Lasswade District £102, against £88, and in the Gala-Water District £37, against £33.

The total road expenditure for all purposes was £57,539, against £47,658 last year. The increased expenditure was principally incurred in carrying out the tar work and reconstruction of roads, towards which the Road Board agreed to pay the sum of £5,447, out of an estimated extra outlay of £8,000.

A large amount of new and relaying existing kerb and channelling was carried out during the year, chiefly being preparatory work for tar-painting and laying footpaths with tarred materials. The only other new works of outstanding importance were the widening of Bow Bridge in the Suburban District, and the completion of the breaking and screening machinery works at Blackford Quarry.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangement well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney G. Turner, of the Middle Temple, Barrister at Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

THIRD INTERNATIONAL ROAD CONGRESS.

LIST OF EUROPEAN CONTRIBUTORS.

Mr. Rees Jeffreys has communicated to us the following list of the writers of papers for the International Road Congress in 1913, which has been furnished to him by Monsieur Mahieu, secretary to the Permanent International Association of Road Congresses.

It will be remembered that the list of American contributors appeared in our issue of August 16th last.

Question 1.

GERMANY.
M. SCHMIDT, Stadtbaurat in Essen.
M. NESSENIUS, Landesbaurat, Geheimer Baurat in Hanover.
M. MAYR, Ministerialrat im Koniglich Bayerischen Staatsministerium des Innern in München.

AUSTRIA.
M. MASIK (Emil), Ingénieur, Professor der bohmischen technischen Hochschule in Brünn.

HUNGARY.
M. DE LIPTHAY (Auguste), Conseiller de Section près du Conseil Supérieur des Travaux Publics métropolitains (Dobrentey ter 4) Budapest.
M. SOLTY (Louis), Conseiller technique de la ville de Budapest. (Központi városhàz) Budapest.

BELGIUM.
M. VERSTRAETE, Ingénieur principal des ponts et chaussées, Rochefort.
M. DE VAERE, Conducteur des ponts et chaussées, Gand.
M. EVRARD, Conducteur principal des ponts et chaussées, Rochefort.

DENMARK.
M. NOHR (W.), Ingenieur en Chef des Routes et des Egouts, Copenhagen.

FRANCE.
M. STOCLET, Ingénieur en Chef des Ponts et Chaussées, Lille.

RUSSIA.
M. DOUBELIR, Professeur à l'Institut Polytechnique, Kiew.

SWITZERLAND.
M. ANDER AUER, Chef du Service des Routes, Bâle.

Question 2.

GERMANY.
M. HENNEKING, Stadtbaurat in Magdeburt.
FUCHS (Dr.), Grossherzoglicher Baurat in Karlsruhe, Eisenlohrstrasse 10 a.

AUSTRIA.
M. HERMANN (Gustav), K.K. Oberbaurat im Ministerium für offentliche Arbeiten, Wein IX., Porzellangasse 33 a.

HUNGARY.
M. NAGY (Alexandre), Ingenieur en chef au Ministère du Commerce (Albrecht ut 1.) Budapest.

BELGIUM.
M. DENIL, Ingénieur Principal des Ponts et Chaussees, Brussels.
M. BYLS, Ingénieur des Ponts et Chaussees, Maeseyck.

FRANCE.
M. VERRIÈRE, Ingénieur des Ponts et Chaussées, Paris.

RUSSIA.
M. KOUNITSKY, Professeur à l'Inst. des Ingénieurs des Voies de Communication, 9 Perspective Zabalkanski, St. Petersburg.

Question 3.

GERMANY.
M. HENTRICH, Stadtbaurat, Königlicher Baurat in Crefeld, Rathaus.
M. LEON, Landesbaurat in Wiesbaden.
M. MAYR, Ministerialrat in München.

AUSTRIA.
M. BRADACZEK (Theodor), K.K. Baurat im Ministerium für offentliche Arbeiten, Wien IX., Porzellangasse 33 A.

HUNGARY
M. BELA MENCZEL, Ingenieur en Chef de la Société Anonyme d'Aspindte Hongroise (Nador utca 4), Budapest.
M. ARPAD RAUCH, Ingenieur, Debreczen.

BELGIUM.
M. MAUQUET, Ingenieur en Chef, Directeur des Ponts et Chaussées, Brussels.
M. BRONDEEL, Ingénieur des Ponts et Chaussées, Brussels.
M. VANDERSCHUEREN, Ingénieur principal des Ponts et Chaussées, Ostend.
M. CLAES, Ingénieur principal des Ponts et Chaussées, Anvers.

FRANCE.
M. WENDER, Ingénieur en Chef des Ponts et Chaussées, Melun.
M. LE GAVRAIN, Ingénieur des Ponts et Chaussées Versailles.
M. MAYER (E.), Ingénieur des Ponts et Chaussées, Paris.
M. FRONTARD, Ingénieur des Ponts et Chaussées, Fontainebleau.

GREECE.
M. CALLAIS (Démétrius), Ingénieur en Chef des Travaux Publics, 5, rue Agésilas, Athens.

MONACO (Principaute de).
GUGLIELMINETTI (Dr.), Secrétaire Général de la Ligue contre la poussière, Villa San Carlo, Monte Carlo, et 82, Boulevard Flandrin, Paris.

RUSSIA.
M. MIKHAÏLOFF, Ingénieur des Voies de Communication, 17, rue Italianska, St. Petersburg.

Question 4.

GERMANY.
M. KRAUSE, Stadtbaurat, Geheimer, Baurat in Berlin, Rathaus.
M. SCHWIENING, Oberbaurat in München.

AUSTRIA.
M. TRNKA (Leopold), Baurat, Wien, Rathaus.
M. KOSETSCHEK (Leopold), Oberingénieur des Stadtbauamtes, Wien, Rathaus.

HUNGARY.
M. LAPPERT (Waoul), Ingénieur en Chef de la Ville de Budapest (Központi városház), Budapest.

FRANCE.
M. MAZEROLLE, Ingénieur en Chef des Ponts et Chaussées, Paris.

RUSSIA.
M. STETZEVITCH, Ingénieur en Chef de la Ville de St. Petersburg (Douma de la Ville).

Question 5.

GERMANY.
M. FLECK, Stadtbaurat in Dresden, A, Neues Rathaus.

AUSTRIA.
M. BOSCHAN (von) (Arthur Ritter), K.K. Oberinspektor der Nordbahn, Wien.

BELGIUM.
M. HANSEZ (Jules), Président du Comite du Tourisme au Royal Automobile Club de Belgique, Brussels.

FRANCE.
M. TUR, Ingénieur en Chef des Ponts et Chaussées, Paris.
M. CHAIX, Président de la Commission de Tourisme et de Circulation générale de l'Automobile Club de France, Paris.

RUSSIA.
M. MERCZYNG, Professeur à l'Inst. des Ingénieurs des Voies de Communication, 9, Perspective Zabalanski, St. Petersburg.

Question 6.

GERMANY.
M. FRANZE, Stadtrat in Frankfurt a Main, Rathaus.
M. WALDECK, Landesbaurat, Geheimer Baurat in Munster.
M. RANGE, Königlicher Oberbaurat in Dresden, Finanzhaus.

AUSTRIA.
M. DUHM (Julius), K.K. Ingénieur der Statthalterei, Innsbruck.

BELGIUM.
M. THONET, Ingénieur des Ponts et Chaussées, Anvers.

FRANCE.
M. LUMET, Ingénieur des Arts et Manufactures, Ingénieur de la Commission Technique de l'Automobile Club de France, Paris.

NETHERLANDS.
M. ELZELINGEN (Van) (J. M. W.), Ingénieur en Chef du Waterstaat de la province de la Hollande Méridionale, La Haye.

RUSSIA.
M. ZVETKOVSKI, Ingénieur des Voies de Communication, Direction des Voies de Communication, Varsovie.

Question 7.

GERMANY.
M. BERDTSCHNEIDER, Stadtbaurat in Charlottenburg, Rathaus.

AUSTRIA.
M. BOSCHAN (von) (Arthur Ritter), K.K. Oberinspektor der Nordbahn, Wien.

HUNGARY.
M. BALLO (Alfred), Directeur du Bureau de Propreté publique de la Ville de Budapest (Központi városház), Budapest.

BELGIUM.
M. HANSEZ (Jules), Président du Comité du Tourisme au Royal Automobile Club de Belgique, Brussels.
FRANCE.
M. CHAIX (Edmond), Président de la Commission de Tourisme et de Circulation Générale au l'Automobile Club de France, Paris.
NETHERLANDS.
M. SANDBERG (Le Jonkheer) (F. E. P.), Ingénieur du Waterstaat des Pays Bas, Gorinchem.
RUSSIA.
M. LOKHTINE, Inspecteur des Chaussées du Gouvernement de St. Petersburg, 17, rue Italianska.

Question 8.

GERMANY.
M. PETERS, Stadtbaurat, Geheimer Baurat in Magdeburg.
M. CASSINONE, Grosserzoglicher Oberbaurat in Karlsruhe, Worholzstrasse 20, III.
HUNGARY.
M. FORSTER (Jules), Conseiller technique au Ministère du Commerce (Albrecht ut 1), Budapest.
M. BELA MENCZER, Ingénieur en Chef de la Société anonyme d'Asphalte Hongroise (Nador utca 4), Budapest.
BELGIUM.
M. DUBOSCH, Conducteur des Ponts et Chaussées, Gand.
FRANCE.
M. MARION, Inspecteur Général des Ponts et Chaussées, Paris.
RUSSIA.
M. HELFER, Chef du Service du Routes, 17 rue Italianska, St. Petersburg.

Question 9.

GERMANY.
M. PETRY, Regierungs-und Baurat in Wiesbaden.
M. TIMME, Regierungs-und Baurat im Ministerium für Elsass-Lothringen, in Strassburg.
HUNGARY.
M. NEMETHY (Joseph), Conseiller technique Royal Esztergom.
M. KEVICZKY (Alexandre), Ingénieur en Chef au Ministère du Commerce (Albrecht ut 1.), Budapest.
FRANCE.
M. BORDAS, Sous-Directeur des Routes et Ponts au Ministère des Travaux Publics, Paris.
MONACO (Principaute de).
GUGLIELMINETTI (Dr.), Secrétaire Général de la Ligue contre la poussière, Paris et Monte Carlo.
RUSSIA.
M. PODGOURSKI, Président de la Société des Chemins Enzeli-Teheran, Ministère des Finances, St. Petersburg.

Communication 1.

GERMANY.
M. RANGE, Königlicher Oberbaurat in Dresden.
AUSTRIA.
M. BRADACZECK (Theodor), K.K. Baurat im Ministerium für offentliche Arbeiten, Wien IX , Porzellangasse 33A.
HUNGARY.
M. BALLO (Alfred), Directeur du Bureau de Propreté publique de la Ville de Budapest (Kozponti városház), Budapest.
M. ARPAD RAUCHE, Ingénieur, Debreczen.
FRANCE.
M. GUILLET, Ingénieur en Chef des Ponts et Chaussées Privas.
RUSSIA.
M. KOUSNETZOF, Ingénieur à la Direction des Routes et de la Navigation intérieure, 17 rue Italianska, St. Petersburg.

Communication 2.

GERMANY
M. MINERALOGISCH-GEOLOGISCHES INSTITUT DER KONIGLICHEN TECHNISCHEN HOCHSCHULE in Berlin, Charlottenburg.
AUSTRIA.
M. HANISCH (August) Professor, Sektionsvorstand und Leiter der Versuchsanstalt für Bau und Maschinenmaterial am Technologischen Gewerbemuseum, Wien IX., Severingasse.
HUNGARY
M. FOCK (Edouard), Conseiller du Magistrat de la Ville de Budapest (Kozponti városház), Budapest.
FRANCE
M. LE GAVRIAN, Ingénieur des Ponts et Chaussées Versailles.
RUSSIA
M. BELELUBSKI, Professeur à l'Inst. des Ingénieurs des Voies de Communication, 9, Perspective Zabalanski, St. Petersburg

Communication 3.

AUSTRIA.
M. BRADACZEK (Theodor), K.K. Baurat im Ministerium für offentliche Arbeiten, Wien IX., Porzellangasse 33A.
HUNGARY.
M. GLASNER (Antoine), Directeur de la Société des Carrières de Kissebes (Wesselenyi utca 2), Budapest.
BELGIUM.
M. CORNET, Ingénieur en Chef, Directeur des Ponts et Chaussées, Liège.
FRANCE.
M. LELIEVRE, Agent voyer d'Arrondissement honoraire, Versailles.
M. PONS, Agent voyer d'Arrondissement, Montpellier.
RUSSIA.
M. TOUKHOLKA, Ingénieur des Voies de Communication, Ialta (Crimée).

Communication 4.

GERMANY.
M. SCHEUERMANN, Stadtbauinspektor in Wiesbaden.
M. RANGE, Königlicher Oberbaurat in Dresden.
AUSTRIA.
M. TRNKA (Leopold), Bourat, Wien, Rathaus.
M. KOSETSCHEK (Leopold), Oberingénieur des Stadtbauamtes, Wien, Rathaus.
FRANCE.
M. SIGAULT, Ingénieur en Chef des Ponts et Chausées, Châlon-sur-Marne.
NETHERLANDS.
WENTHOLT (Dr.) (L.R.), Ingénieur du Waterstaat des Pays-Bas, Hoorn.
RUSSIA.
M. KOUPERSTEIN, Ingénieur de la Direction des Voies de Communication de Vilna, Vilna.

Communication 5.

GERMANY.
M. STADTBAURAT in Stadt, Elberfeld.
HUNGARY.
GLASNER (Antoine), Directeur de la Société des Carrieres de Kissebes (Wesselenyi utca 2) Budapest.
FRANCE.
M. LABORDERE, Ingénieur des Ponts et Chaussées, Paris.
RUSSIA.
M. NOVGORODSKI, Ingénieur adjoint au Directeur du Laboratoire mecanique, 9 Perspective Zabalanski, St. Petersburg.

Communication 6.

GERMANY.
M. GAETJENS, Landesbaurat in Kiel.
M. MAYR, Ministerialrat in Munchen.
AUSTRIA.
M. BRADACZECK (Theodor), K K. Baurat im Ministerium für offentliche Arbeiten, Wien IX., Porzenglasse 33A.
FRANCE.
M. LORIEUX, Ingénieur en Chef des Ponts et Chaussées, Directeur de l'Office National du Tourisme, Paris.
NETHERLANDS.
M. GELINCK (W.G.C.), Ingénieur du Waterstaat des Pays Bas, Assen.
RUSSIA.
M. NIKOLSKI, Ingénieur à la Direction des Voies de Communication de la region de Saint Petersburg. St. Petersburg.

Communication 7.

GERMANY.
M. SCHWIENING, Oberbaurat in München.
M. MAYR, Ministerialrat in München.
AUSTRIA.
M. HOFER (Richard), K.K. Hofrat im Handelsministerium, Wien.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire

EASTERN DISTRICT MEETING AT GRAYS.

District Chairman—Mr. A. Fidler, M.Inst.C.E., Northampton.

An Eastern District meeting of the Institution of Municipal and County Engineers is to be held at the council offices, High-street, Grays, on Saturday, September 21st.

Programme.

11 a.m.—Meet at the council offices, High-street. Members will be received by Mr. H. E. Brooks, J.P., chairman of the urban district council.
11.15 a.m.—Formation of District Executive Committee. Paper, entitled "Municipal Works of Grays," by Mr. A. C. James, Assoc.M.Inst.C.E., surveyor to the urban district council (member).
11.30 a.m.—Discussion.
11.45 a.m.—Drive to the "Beach" Recreation Ground and open-air swimming pool, new infant school and school baths, Bridge-road, and thence to the Wouldham Cement Works.
1 p.m.—Light refreshments by kind invitation of the Wouldham Cement Company.
1.30 p.m.—Inspection of the cement works.
3.30 p.m.—Proceed to the works of Messrs. Siegwart, Limited, to inspect the manufacture and testing of their reinforced concrete pipes.
Tea kindly provided by Messrs. Siegwart, Limited.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than to-morrow (Saturday), when copy of the paper will be sent in due course.

E. J. Elford,
Hon. District Secretary
Southend-on-Sea. Borough Surveyor

EAST MIDLAND DISTRICT MEETING AT ILKESTON.

District Chairman—Mr. E. G. Mawbey, M.Inst.C.E., Leicester.

An East Midland District meeting will be held at the Town Hall, Ilkeston, on Saturday, September 28th.

Programme.

10.45 a.m.—Reception by the mayor, Councillor S. Shaw, J.P., at the town hall.
11 a.m.—Special cars to Hallam Fields for Stanton Ironworks.
11.30 a.m.—Visit Stanton Ironworks.
1 p.m.—Lunch (kindly provided by the company) at the Stanton Ironworks Company's Hotel.
1.45 to 2.30 p.m.—Formation of District Executive Committee. Discussion on papers (which will be taken as read): "Ilkeston Sewage Disposal Works," by Mr. H. P. Raikes, engineer; "Twenty-eight Years' Municipal Work at Ilkeston," by Mr. H. J. Kilford, borough surveyor; "Ilkeston Tramways and Electricity Supply," by Mr. H. P. Stokes, borough electrical engineer.
3 to 4 p.m.—Inspection of the new sewage disposal works. The party will be conducted over the works by the engineer, Mr. H. P. Raikes.
4.10 p.m.—Special cars to the town hall, where tea will be provided
Should time permit, a visit will be paid to the car sheds, police station, free library, cemetery chapels, lodges, gasworks, &c.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Saturday, September 21st, when copy of the papers will be sent in due course.

R. A. MacBrair, M.Inst.C.E.,
Hon. District Secretary.
Lincoln. City Engineer.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF WATER ENGINEERS.

President—Mr. J. S. Pickering, M.Inst.C.E., Borough and Water Engineer of Cheltenham.

VISIT TO SOUTH WALES.

On Saturday, September 21st, by invitation of Mr. C. H. Priestley, M.Inst.C.E., engineer for the works, a visit will be paid by the members of the Institution of Water Engineers to the Llwyn-on reservoir, in course of construction for the Corporation of Cardiff.

Programme.

9.15 a.m.—Train leaves Cardiff (Rhymney Station) for Merthyr.
10.40 a.m.—Brakes leave Merthyr for Cefn-Coed, whence the party will be conveyed by the contractors' light railway to the Llwyn-on reservoir works, passing the Sychpant limestone quarry *en route*.
11.30 a.m.—Arrive at the works, which will be inspected under the personal guidance of Mr. C. H. Priestley and his staff. The drawings will be arranged for inspection at the office. A paper, descriptive of the reservoir, by Mr. Priestley, will be circulated among those taking part in the visit.
1.15 p.m.—Luncheon served in the mission hall.
2.15 p.m.—Brakes leave the works for the Cantreff reservoir (opened 1892) and for the Beacons reservoir (opened 1897), whence the drive will be continued to the top of the gathering ground, returning to Merthyr *viâ* the Cefn-Coed balancing reservoir, which will be inspected *en route*.
4.30 p.m.—Train leaves Merthyr for Cardiff, arriving at Rhymney Station 5.40 p.m.
6.8 p.m.—Train leaves Cardiff (G.W. Ry. Station), arrives Cheltenham 8.16 p.m., Birmingham 9.50 p.m.
6.43 p.m.—Train leaves Cardiff (G.W. Ry. Station), arrives Paddington 9.35 p.m.
7 p.m.—Train leaves Cardiff (G.W. Ry. Station), *viâ* Hereford, arrives Birmingham 10.20 p.m.

Arrangements have been made with the manager of the Park Hotel, Cardiff, to accommodate members and visitors on special terms: Bed, breakfast and attendance, 7s. 6d.; bed, breakfast, dinner and attendance, 10s. 6d. A smoking and conversation room will be reserved on Friday evening for the use of those taking part in the visit.

Members desiring tickets for the visit (price 10s. 6d.) should apply to the secretary, Mr. Percy Griffith, 20 Victoria-street, S.W., at once.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, assoc.m.inst.c.e., Borough Surveyor, Windsor.

ANNUAL MEETING.

The annual meeting will be held in London in October.

B. Wyand,
Secretary.

39 Victoria-street, S.W.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. John D. Watson, m.inst.c.e., f.r.s.i.

YORKSHIRE DISTRICT MEETING.

By kind permission of Councillor W. G. England, J.P., chairman of the Sewage Works Committee the members of the above association will visit and inspect the Barnsley sewage works on Saturday, September 21st.

Objects of Interest: Screening chamber, suction-gas pumping plant, sedimentation tanks, percolating filters, 100-ft. and 120-ft. diameter distributors, and syphon sewer.

Programme.

2.30 p.m.—Reception in the town hall by his Worship the Mayor, Councillor J. H. Cotterill, J.P., and the chairman and members of the Works Committee.

3 p.m.—Proceed to the works, which are situated about 2 miles from the town. Conveyances will be provided.

3.30 p.m.—Descriptive paper will be given by Mr. J. Henry Tayler, assoc.m.inst.c.e., borough engineer and surveyor, who will also conduct the visitors over the works, assisted by the manager, Mr. Chas. M. King.

5 p.m.—Tea, by kind invitation of the chairman, Councillor W. G. England, J.P., at the Imperial Hotel.

The works have been recently reconstructed, and are well worth a visit. Members intending to be present are requested to notify the district secretary not later than Wednesday, September 18th.

Robert Tyson,
Hon. District Secretary.

Queensbury Sewage Works,
Amblerthorn,
Nr. Halifax.

METROPOLITAN DISTRICT MEETING.

An inspection of the St. Albans sewage disposal works will be made by the members of the Association of Managers of Sewage Disposal Works on Saturday, September 28th, at 2 p.m.

The works comprise sedimentation tanks, sludge receiver, sludge distributing main, coarse contact beds, percolating filters, Fiddian travelling distributors, humus tank, final land treatment, &c. The pumping plant comprises a Teasdale suction-gas plant, two 12 h.p. gas engines, and two 6-in. centrifugal pumps.

Programme.

Assemble at entrance to works near Park-street Station (L. and N.W. Rly.).

The party will be conducted over the works by Mr. A. Eade, the manager, who will explain the system of treatment.

A paper will be read by Mr. H. Howard Humphreys, Westminster.

His Worship the Mayor and other members of the corporation have promised to be present.

Those attending to be present will please notify the undersigned on or before Thursday, September 26th.

Jas Craig,
Hon. District Secretary

68 Empress-avenue,
Manor Park, E.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, LEWES.

At a meeting of the Royal Sanitary Institute, to be held at the Town Hall, Lewes, on Friday, October 4th, at 7 p.m., Mr. D. Roberts, the borough surveyor of that town, will open a discussion on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams," among those who are expected to take part in the proceedings being Messrs. John H. Blizard, assoc.m.inst.c.e., Southampton, A. J. Martin, m.inst.c.e., Westminster, and A. E. Prescott, borough engineer and surveyor, Eastbourne.

The chair will be taken by Mr. H. Percy Boulnois, m.inst.c.e., chairman of council of the institute.

On the following morning the members will visit the Phœnix Ironworks and the Lewes Portland Cement and Lime works, and in the afternoon inspect the Lewes Victoria Hospital, the borough isolation hospital, the fire brigade station, and the waterworks.

Airds, Limited, London	£11,071
W. Hirst & Son, Sheffield	10,451
H. Ashley, Macclesfield	10,359
A. Hyslop, Manchester	9,885
W. Cunliffe & Sons, Birmingham	9,400
W. W. Bateman, Chesterfield	9,219
Pethick Dix & Co., London	9,182
W. Morley & Sons, Manchester	9,069
Sanders & Torrance, Stoke-on-Trent	8,983
D. Eadie & Co., Limited, Stockport	8,711
M. A. Boswell, Wolverhampton*	8,259

WINCHCOMB.—For laying and jointing 9-in. and 6-in. stoneware pipe sewers, together with manholes and lampholes; also the construction of sewage tanks, &c., laying out of land for irrigation, and other incidental works at Bishop's Cleeve, for the rural district council.—Messrs. Phillott & George, Cheltenham, engineers:—

J. Riley, Cheltenham	£4,070
R. Bowen, Cheltenham	3,380
M. Williams & Co., Cheltenham	3,227
A. Hill & Co., Kidderminster	3,068
Johnson Brothers, Gloucester*	2,937

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

14.—Institute of Sanitary Engineers: Visit to Kensington Destructor Works.

18-21.—Annual Congress of the Sanitary Association of Scotland, at Montrose.

21.—Institution of Water Engineers: Visit to Llwyn-on Reservoir, South Wales.

21 (or 28).—Institution of Municipal and County Engineers: Eastern District Meeting at Grays.

25-27.—Municipal Tramways Association: Annual Conference at West Ham.

28.—Institution of Municipal and County Engineers: East Midland District Meeting at Ilkeston.

OCTOBER.

1-5.—Royal Sanitary Institute: Meeting at Lewes; Mr. D. Roberts, borough surveyor, on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams."

26. Royal Sanitary Institute: Meeting at Alton; Discussions on "Housing Problems in County Areas" and "Municipal Work in Alton." Town Hall, 11.15 a.m.

APPOINTMENTS OPEN.

THE MUNICIPALITY OF DELHI, INDIA, require the services of an Assistant, experienced in Municipal Engineering.—For further particulars apply to "Municipal Engineer," office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

ALNWICK URBAN DISTRICT COUNCIL.
CLERK OF WORKS.

Applications are invited for the appointment of a Clerk of Works in connection with the augmentation of the Waterworks for the above district, at a salary of £3 3s. per week. The person appointed will be required to devote the whole of his time to the duties of the office and work under the instructions of the Council's Engineers, Messrs. Taylor, Wallin & Douglas, of Newcastle-on-Tyne and to commence immediately.

It is necessary that applicants should have had considerable experience in levelling, setting out of works, and of ferro-concrete constructions.

Applications, in the candidate's own handwriting, stating age, qualifications, present and past experience, together with copies of not more than three recent testimonials, and endorsed "Clerk of Works," must be addressed and delivered to me at the Council Offices on or before Friday morning 20th September instant.

Probable duration of engagement—six months. One month's notice on either side to terminate engagement.

Canvassing members of the Council, or Engineers, either directly or indirectly, will be considered a disqualification.

JOHN BALMBRA
Clerk to Urban District Council.

Council Offices,
Alnwick.
September 6, 1912.

WANTED for India, energetic Young Land Surveyor; thoroughly good and plane table Topographical worker; good draughtsman. Apply, with copies certificates to Planter's Stores and Agency Co., Ltd. 17 St Helen's-place, Bishopsgate, London, E.C.

RURAL DISTRICT COUNCIL OF MUTFORD AND LOTHINGLAND.
DISTRICT SURVEYOR.

The Council invite applications for the post of District Surveyor for this Rural District, comprising about 28,171 acres, with about 110 miles of roads. The population is 11,184.

The officer appointed will be required to take control of all roads, sewers and sewage disposal works under the jurisdiction of the Council, to see that the by-laws as to new streets and buildings are properly carried out, and to do all other work under the Public Health, Highway or other Acts which pertain to the office. He must hold the certificate of the Municipal and County Engineers' Association. The appointment will be determinable by one month's notice on either side.

The salary will be £125 per annum, and the Council will provide an office, stationery and postages. A sum of £15 per annum will be allowed to the Surveyor appointed if he provides and uses a motor cycle. He will be required to live in the district, to devote his whole time to the work, and to give security to the Council through an approved Guarantee Society to the amount of £150.

Applications, in candidate's handwriting, and endorsed "District Surveyor," must reach me not later than Saturday, the 21st instant, and must state age, qualifications and experience, and be accompanied by copies of three recent testimonials.

Canvassing of members of the Council is prohibited.

(By order of the Council)
E. S. NORTON,
Clerk.

148 London-road, Lowestoft.
September 10, 1912.

WATFORD URBAN DISTRICT COUNCIL.
ENGINEER'S ASSISTANT.

The Watford Urban District Council invite applications for the appointment of an Engineering Assistant.

The applicant must be a good draughtsman, have a practical knowledge of drainage works, waterworks and private street works, and be able to take levels and make surveys. The officer appointed will be required to devote his whole time to the service of the Council, at a commencing salary of £100 per annum, and to perform his duties under the direction of the Engineer.

Office hours from 9 a.m. to 5.30 p.m.

Application (written on foolscap, one side only), stating age, qualifications and date on which the applicant could enter on the duties, accompanied by copies of not more than three recent testimonials, to be sent to the offices of the Council, 14 High-street, Watford, on or before 9 a.m. on Wednesday, 25th September, 1912.

Canvassing, directly or indirectly, will be a disqualification.

W. HUDSON,
Clerk and Solicitor.

Council Offices,
Watford.
September 5, 1912.

BOROUGH OF DARWEN.
WATERWORKS DEPARTMENT.
APPOINTMENT OF MAINS FOREMAN.

The Darwen Corporation Waterworks Committee require a Working Foreman in the Distribution Department.

Applicants must have practical knowledge of the laying of Water Mains, Services, Detection of Waste, and the Testing and Inspection of Fittings, &c. Preference will be given to candidates having had similar experience under a Public Waterworks Authority.

Wages 32 per week. List of duties and conditions of employment must be obtained from the Waterworks Engineer by candidates previous to making application.

Applications, accompanied by not more than three testimonials (copies only), must be addressed to the undersigned and delivered on or before Thursday, the 19th inst.

R. W. SMITH-SAVILLE, ASSOC.M.INST.C.E.,
Waterworks Engineer.

Municipal Offices,
Darwen.
September 7, 1912.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. SEPTEMBER 20, 1912. No. 1,079.

Minutes of Proceedings.

The Philosophy of Engineering.

As regards practical policy in the carrying out of engineering works, there are two basic or, rather, leading ideas in Prof. Barr's presidential address to the Engineering Section of the British Association at Dundee. One of these is that the more truly the engineer bases his work on the eternal verities, the less will the results tend to harm or annoy the public, or those persons who for various reasons suffer from the effects of works carried out in a manner less in harmony with the laws of Nature. The second of these ideas is that, if engineers took a wider view of their responsibilities than they usually do, they would definitely aim at carrying out their work in such a manner as to cause as little inconvenience or harm as possible. Prof. Barr fails to point out, however, that the two principles are often in conflict; a work which is in harmony with natural laws may easily jar upon the susceptibilities of persons who are out of harmony with those laws, more especially, say, with that group of them with which the engineer is chiefly concerned. We will not do Prof. Barr the injustice of assuming that in his main arguments the term "engineer" is used to denote only members of the engineering profession. As regards his broader contentions, he obviously intends the expression "the engineer" to include all persons who control engineering works, financially or otherwise; but he seems to have somewhat overlooked the most important class of all—the public, who pay for what they desire, not necessarily for what they need. There is a definite demand for moons with the bright side of the face "remote from the source of light." Another important point which must not be overlooked in this connection is that in attempting to do what it is wise to do for the community as a whole, and with our thoughts on the future, we are constantly hampered by the necessity of watching over the pressing needs of the poorer classes in the immediate present. Engineering is, after all, the most important visible expression of government, and the most honourable title of any potentate or government is "Protector of the Poor." In municipal engineering there is a constant conflict between the attempt to do what is economical as regards both present and future taken together, and, on the other hand, the effort to keep down the rates. These considerations, however, do not weaken the force of the epigram on which this address pivots: "The works of the engineer are to be used by some people; they have to be endured by all."

Prof. Barr is happy in his choice of the racing yacht as an example of the contention that "the attainment of the highest efficiency brings with it the greatest artistic merit." He is less fortunate in his references to the work of highway engineers. To say the least of it, his selection of the case of a surveyor who acts carelessly or negligently in the matter of road repair is hardly on a level with the rest of his address. Things which happen because bankrupt drapers and local ne'er-do-weels sometimes occupy posts honoured by the title of "surveyor" have nothing to do with engineering. Worse than this, we find remarks with regard to the nature of a road crust which display not only unfamiliarity with the subject from the practical point of view, but also a temporary haziness of vision with respect to the operation of natural laws. The "ideal road" may be in either of two classes. It may be the kind of road described in visions of the New Jerusalem, with which, at our present stage of evolution at any rate, we are not concerned; on the other hand, it may mean, and in a presidential address to the Engineering Section of the British Association should mean, a road which can be imagined to exist under the present system of physical laws. If this is the kind of ideal intended we must point out that it certainly would not be "one that would not wear at all." Prof. Barr actually said that "the demand that is being forced upon the engineer to eliminate this nuisance (dust) is leading to an improvement of our roads for all users," which reminds one of the proverb "Any stick to beat a dog with." We desire directly to traverse the statement that "It is no part of the function of a road surface to fritter itself down into dust under traffic of any kind." The less dust the better, of course, but broken-down material of some kind there must be if the road is to serve its purpose. Surfaces in working contact must be in one of three classes: they must be effectively lubricated, as in the case of engine bearings, or they must become highly polished, or they must wear. With lubricated surfaces we must have outside control of the direction of motion and an outside point of application of the moving force; with polished surfaces we must have similar control—that afforded, for instance, on both counts, by the groove which the skate cuts in the ice on a pond. On roads and railways the necessary means of applying force, and in the latter case of directing motion, is supplied by friction which cannot be maintained unless the surfaces wear. Since the road surface has to prevent movement sideways as well as to supply friction for the application of power, and for braking, it is probable that the amount of wear, which is the necessary accompaniment, with the materials at our disposal, of the maintenance of a suitable roughness, must be considerably greater than in the case of a railway. This is the more likely from the fact that the road is subject to a far greater range of conditions, both as regards gradients and with respect to vehicles and their wheels. To revert for a moment to the case of the railway, it

may be pointed out that, in spite of the moderate gradients, it is found necessary to use sand in slippery weather in order to make the surface of the rails sufficiently non-slippery.

These remarks are not intended to damp the enthusiasm of those who are making intelligent attempts to use new materials, but these materials will not assist anybody to evade the natural laws which govern the relations between force and matter. Prof. Barr's ideal road suggests an ideal vehicle, having wheels like those of a pedrail tractor, but each foot a sucker-foot like that of the house fly, and equally efficient. Generally, we contend that there is an essential difference between "*an* ideal road," which may presumably be imagined to be fitted with various devices and subjected to a general levelling of gradients involving the making of tunnels and aqueducts, and the purchase of large areas of land—there is an essential difference between this and "*the* ideal road," which must necessarily possess the essential features at least of *the* ordinary highway.

* * *

Sterilisation of Water by Chlorine Gas.

A paper read by Dr. D. D. Jackson, of New York, dealing with the chlorine sterilisation of water is noticed elsewhere in the present issue. Dr. Jackson brings forward facts to which we have frequently called attention during the last few years. The first is that overdosing with the sterilising agent, leading to unpleasant tastes and odours in the water, is liable to occur unless an efficient automatic dosing apparatus is used. The flow of hypochlorite must be in exact proportion to the flow of the water if overdosing is to be avoided. Again, results at Cleveland and elsewhere clearly show that if the water is sufficiently free from organic matter the dose of hypochlorite may be reduced to a minimum. This is also a fact which we have dealt with many times, and apparently its truth is at last finding acceptance. Instead of adding hypochlorite to the water before or during filtration in comparatively large quantities, we find that a dose of from 0·7 to 0·5 parts per 1,000,000 of available chlorine is giving good results at Cleveland, 0·35 parts per 1,000,000 are used at Jersey City and at Cincinnati, and 0·5 parts per 1,000,000 at New York.

As is well known, electrolytic hypochlorite is being used at many places, and there can be little doubt that it will ultimately supersede bleaching powder, for it is obvious that the great difficulty of adding this chemical to the water in exact doses in the minute proportion of, say, 0·5 parts of available chlorine per 1,000,000, is altogether against its use, without taking into account the many other advantages of electrolytic hypochlorite over the chemical. Dr. Jackson, however, brings forward and strongly advocates the use of compound chlorine liquefied under pressure. This is sold in cylinders, and is mixed with the water. There is no doubt as to the ease with which it can be applied, but the process of mixing chlorine gas with water in this manner is open to objection. Chemists will not readily agree that the admixture of chlorine gas with water will produce the same result as the admixture of hypochlorite solution. The subject is too long and complicated for full discussion at the moment. But briefly the sterilisation of water by means of chlorine gas is due to the fact that the chlorine combines with the hydrogen in the water, and forms hydrochloric acid, while the oxygen is liberated, and it is this nascent oxygen which performs the work of sterilisation. With hypochlorite, however, there is a certain amount of oxygen present, and this, with the oxygen produced by means of the chlorine present in the hypochlorite, sterilises the water. Thus with chlorine gas twice the amount of chlorine is required, and presumably twice the amount of hydrochloric acid remains in the water. Again, with hypochlorite, the gas is given off in minute bubbles, and is thus more readily dissolved in the water, but if chlorine gas is blown through in bulk it is inevitable that bubbles of gas will escape.

It appears that complete reliance is placed upon the hypochlorite sterilisation at Cleveland. The addition of from 0·5 to 0·7 parts per 1,000,000 of available chlorine to the water is considered, and has apparently been proved to be sufficient to render the water safe for use, even when the sewage-laden ice from the river and harbour has caused specific infection at the water supply intake. It is also found that with these small doses there is no unpleasant smell or taste in the water. It is to be regretted that there is as yet so little definite evidence to hand as to the results of sterilisation. It is to be anticipated that when statistics are forthcoming a considerable drop in the typhoid death-rate will be shown, and that where deaths from typhoid fever have been avoided there will also be a considerable decrease in the death-rate from other causes. Much evidence has been brought to light, showing that an improvement in the quality of drinking water has had this effect at a number of towns, but more evidence is needed before the great advantages of sterilisation will be fully grasped.

* * *

Dungarvan Council and its Surveyor.

Mr. J. A. Ryan, surveyor to the Dungarvan Urban District Council, has been constrained to resign his post on the ground, not apparently refuted by the urban council, that "it would be impossible for him to comply with the new conditions imposed by the council . . . chiefly because the expenses alone would amount to about three times the salary of 19s. 2½d. per week paid by the council to their surveyor." This, it will be generally allowed, would be an all-sufficient reason for Mr. Ryan, or any other surveyor similarly treated, to "send in his papers." It will not surprise most people, Dungarvan Urban District Council being such as it obviously is, to know that the surveyor had also to "defend himself against the very unjust charges made against him by a certain section" of the members. What ever the precise matter in dispute between Mr. Ryan and the council may have been, it was quite candidly admitted by the chairman, Mr. Thomas Power, that an attempt had been made to cast new duties upon the surveyor, for in the course of a statement he remarked that the advertisement for the vacancy "caught to be based on the conditions laid down recently for Mr. Ryan, which will show that we are not going to impose lighter duties upon a new man. This, as well as the peculiar tone of the discussion, a tone apparently based upon a feeling of regret that the council are debarred by the Local Government Board from appointing as surveyor individuals variously described as "handymen," and persons "not qualified"—would suggest that Dungarvan councillors have yet to realise their duty to the public as well as to the profession of municipal engineers. Perhaps some allowance is justly to be made for people who are still young in their career of local self-government, but, even so, all the circumstances of this case, which does not stand alone, go to prove that but for the beneficent restraints of a central government authority the standard of municipal work in Ireland, and therefore of public health, would be seriously depreciated.

* * *

The Institution of Municipal and County Engineers.

From the report which appears in another column, it will be seen that many matters of interest came up for discussion at the last meeting of the council of the Institution of Municipal and County Engineers. Not the least important of these was the Mutual Defence Fund. This is now one of the established branches of the Institution's work, and members will anxiously await the devising of a satisfactory

scheme for its operation by the Constitution Committee, to whom the matter has been referred. A report was received from the Standardisation Committee in regard to a specification for street lighting. The comparison of competing methods of illumination and the drawing of a specification which will secure an adequate and definite illuminating power have hitherto been matters of considerable difficulty, and the new specification will no doubt be appreciated as much as its predecessors dealing with other subjects. The work of the Standardisation Committee has always been received with favour by the members, the latest evidence of this being the exhaustion of the first edition of the Concrete Flag Specification. On the recommendation of the Roads Committee, the council resolved to make a contribution of 100 guineas to the International Road Congress which is to be held in London next year. The Institution will have to play a considerable part in this congress, and it will be generally felt that the donation which is to be given to the funds is not incommensurate with the dignity of the British municipal engineering profession. The last matter to which we desire to refer is the motion of which Mr. Cockrill gave notice, that a Town Planning Conference should be held in connection with the next annual meeting, and that steps should be taken with a view to obtaining the sanction of the Local Government Board to the payment of the expenses of the delegates by the authorities whom they represent. This is a matter upon which we have often expressed an opinion, and it is sufficient here to say that attendance at such a conference by the advisers of local authorities is primarily of value in securing that the most modern views on a new subject shall be at their disposal, and that consequently the expense involved in securing such information should in justice be borne by the authorities and not be made a personal charge on their officials.

The Importance of Culverts and Small Highway Bridges.

The design of small, single-span highway bridges and of road culverts is a matter which has been neglected in many countries, although it is one which merits special attention on the ground that careful culverting and the provision of solid and lasting small-span bridges is work which is always worth doing, whether the roads are, otherwise, good or bad. Good culverts not only add to the value of a good road bed and crust, but they reduce the cost of its maintenance and repair, and where the roads themselves are but ill provided with solid crusts a well-devised system of culverting adds to the present value of the road by reducing the effort of hauling at some of the worst places, and increases its potential value as a sound earthwork capable of being gradually brought into the condition of a hard highway. A wide main road in Spain, provided with fine stone bridges in the hilly parts of the route, but crossing the "rambla" in the plain by gravelly or stone-paved fords, may be less praiseworthy as an engineering work than some humble district road in India adequately provided with bridges and culverts throughout its length.

The United States is one of the countries which has suffered, and is still suffering, from a lack of attention to work of this kind, but the United States Office of Public Roads has taken up the matter in a way which promises a rapid and general improvement. In another part of the present issue we have reproduced, from Bulletin No. 43, issued by that office, a number of the most notable passages relating to methods of procedure and types of design, and such as are of general interest beyond the borders of the United States. We have altered the sequence of the passages quoted, but this is purely a matter of grouping for the convenience of our readers and in order to eliminate the portions with which we have no immediate concern.

A Loan without Sanction.

The report of the district auditor contains some plain comments on the financial device adopted by the Holborn Borough Council in connection with the contract for paving Shaftesbury-avenue with wood. It appears that instead of first getting sanction for a loan in the usual way, and then paying the contractors as the work proceeded, an arrangement was made by which the work was to be paid for by a series of fifteen equal annual instalments, such payments to include first cost, interest, repairs and renewals when necessary. The intention was to pay each instalment when it fell due out of current rate. This is certainly a very novel method of payment, and we entirely agree with the district auditor when he points out that such an arrangement is open to legal objection as being equivalent to spreading over a period of years the cost of the new work done in the first year—that is, the major part of the whole work—without first obtaining proper authority for raising a loan. This is entirely opposed to one of the main principles of municipal finance under which loans are raised—namely, that every proposed loan should be submitted to the judgment of a central authority whose sanction must be obtained before the money is borrowed. According to the auditor's report, too, the circumstances under which the expenditure was incurred in the Holborn case were such as to make the scheme of payment even more objectionable than it would otherwise have been. The estimates for the year did not include the work in question, and it appears that the council availed itself of the contractors' offer to accept deferred payments after pressure had been brought to bear upon it by persons desirous of having wood substituted for the stone setts with which the road had previously been paved. The objections to raising loans without sanction are so manifest that we are glad that the district auditor has spoken so plainly in regard to the novel system of payment proposed in this case.

Bath Council and the City Surveyor.

Recent proceedings at the Bath City Council in regard to the Orange-grove improvement provide an excellent illustration of the mischief which arises when members of local authorities imagine themselves possessed of expert knowledge in regard to matters which are in reality outside their legitimate sphere. Certain retaining walls had to be constructed, and plans were prepared by Mr. Fortune, the city surveyor. These plans did not meet with the approval of one of the councillors, who was of opinion that the design was unnecessarily expensive; and after some discussion the council resolved to take the rather extraordinary course of submitting the plans to an outside engineer "for revision." Such a proceeding certainly has the appearance of a veiled vote of want of confidence, and the flimsy nature of the whole agitation in consequence of which this very serious step was taken may be gauged from the fact that Mr. Fortune's design met with the unqualified approval of the selected judge, who reported that "any alterations for reducing the proposed thickness of the various sections would be extremely unwise and unjustifiable."

We congratulate Mr. Fortune on this not unexpected outcome of a very unpleasant business. It would save a great deal of unnecessary trouble if members of local authorities would remember that their engineers have been retained as professional advisers, and that if the works which they are called upon to carry out should fail owing to interference from other quarters in matters of design, the blame would fall upon their shoulders for having acquiesced in a course which they, as experts, ought to have known was unsafe. Why employ an expert adviser, if his advice is not to be followed?

D[illegible]

Experiments on the Weathering of Portland Stone.

By Dr. J. S. OWENS, F.G.S., ASSOC.M.INST.C.E.

This investigation was undertaken at the suggestion of Dr. Des Voeux, and has been carried out on behalf of the Coal Smoke Abatement Society. The importance of a careful consideration of the process known as "weathering" can hardly be exaggerated. Many of our national buildings are suffering serious, if not irremediable, defacement by the gradual fretting away, not only of ornamental traceries on their surfaces, but also of the faces of main walls and buttresses.

The Abbey of Westminster is a notable example of the decay of stone. The authorities of the Abbey regard this matter as very serious, and in 1901 they called for a report upon it from Sir A. H. Church and Mr. Herbert Jackson. Details of their report will be referred to later, but it is mentioned at this point to show the practical importance of the subject.

It is well known that certain impurities common in the atmosphere of manufacturing towns greatly accelerate the deterioration or weathering of building stone. This action is particularly apparent in stones in which the carbonates of calcium or magnesium are found in large proportion. As magnesium forms a soluble sulphate, stones rich in this suffer more from city air than where the calcium carbonate predominates. Such stones may be roughly divided into two groups—*viz.*:—

(*a*) Those in which silicious or other mineral particles are cemented together by one or other of the carbonates named.

(*b*) Those in which the granular parts are themselves carbonates, while the matrix or "ground" is also carbonate or of a more durable substance.

In either case the atmospheric impurities attack and disintegrate the carbonate, whether cementitious or granular. Somewhat similar processes of degeneration take place in other stones when weathering, but it is more rapid and more easily observed in the sandstones and limestones in which calcium or magnesium carbonate is present. The destruction of limestones in cities is usually due to sulphur acids which convert the carbonate into a sulphate with consequent loss of cohesion. These effects are supplemented by the purely physical agencies of wind, rain and frost, each of which plays its part in preparing the surfaces for and accelerating the more serious chemical decay which is especially evident in our large cities.

Physical disintegration is common to all climates and seasons, but is in no way due to chemical pollution of the atmosphere, which is the prime cause of disintegration in cities. In 1909, with the permission of the Dean and Chapter, the author carefully inspected the stonework of Westminster Abbey, and prepared a report upon it for the Smoke Abatement Society. At some points the original stone had decayed to a depth of about 9 in. from its surface. There are other parts where the stone has been destroyed to a depth of about 2 in. in twenty years. Renewals are so frequent that almost the entire outer skin of the building, as originally erected, has been replaced in comparatively recent years.

The report of Sir A. H. Church and Mr. Jackson in 1901 contains chemical analyses of the abbey stone. It was found that some stones, originally free from calcium sulphate, contained on analysis from 14 to 30 per cent. The amount of sulphate decreased as the depth from the exposed surface increased. For example, from the south-east buttress of the clerestory (1702) the sample contained 24·2 per cent on the surface, and at a depth of 2 in. there was only 1·54 per cent.

When reporting to the Smoke Abatement Society in 1909 I wrote: "I do not think that all is yet known as to the causes of decay; for example, with apparently similar stones forming the surface of a wall one expects to find a uniform decay of the whole surface."

The condition of the abbey clearly indicates a selective action by which certain individual stones suffer far more than others in their immediate vicinity. "This peculiar selective action was noticeable in very nearly every part of the abbey, and did not appear to be due to incorrect bedding of the stone." The experiments I have been making, if continued to a satisfactory conclusion, may throw some light upon this apparent selective action; but up to the present no such happy issue has been attained.

The immediate purpose of the experiments was to measure the rate of loss of strength of stones from weathering under varied conditions. For this purpose Portland stone was selected as most suitable and most commonly used in London. All the specimens of which tests are recorded were of this material, quarried at Wakeham, Portland. It was proposed to make strength alone the test of durability, rather than loss of substance, porosity of surfaces, or chemical changes in the composition of the stone. In order to apply this test it was necessary first to select a fair standard of comparison, and, secondly, to devise some method by which the process of weathering might, if possible, be accelerated.

With respect to a standard of strength, it was at first thought that the strength of stones which had received no exposure would form an adequate standard, and in Series 1 and 2 referred to later the weathered stones are compared with stones broken after cutting and without exposure. For subsequent tests this basis of comparison was abandoned. It was found that stones normally show a considerable increase of strength for some time after quarrying; drying out of the so-called "quarry sap" has been suggested as a reason for this.

The only other standard suitable for comparison is the strength of the stones broken on the same dates as those subjected to exposure, but themselves kept indoors and under cover after cutting, such as, for example, Group 9, Table 1.

The specimens were treated as follows: The stone was selected at the quarry and forwarded to London, where it was cut to shape. The specimens for tensile tests were shaped similarly to the ordinary cement briquette for tensile testing, and had a minimum section of about 1 sq. in. Specimens intended for compression tests were cut to cubes of 1-in. side. The dates of quarrying and cutting were recorded. The specimens were distributed for exposure in three places. A number were retained on the premises of the Gas Light and Coke Company, Westminster, where the tensile tests were conducted under the direction of Mr. J. G. Clarke. Others were exposed by Dr. Des Voeux in London at Buckingham-gate, and the remainder at Cheam, Surrey, by myself. At each of these places certain stones were exposed out of doors to normal conditions of weather. Others were exposed indoors, and a third group were embedded in soot and exposed out of doors.

The effect of soot is considerable, and it cannot be doubted that, although soot, as such, might be regarded as a harmless colouring material, yet, in reality, it serves as a vehicle for conveying the harmful acids emitted from burning coal to the stone on which it is deposited. It is known that soot particles act as absorbents for the acids produced from the sulphur in burning coal. Samples of London soot have been shown to contain from 4 to 5 per cent of SO_3 (sulphuric anhydride). The amount of soot deposited in our cities is enormous. In Glasgow, on the suggestion of Sir J. Ure Primrose, the rate was measured by exposing boxes on the roofs, and it was calculated that over 22 cwt. of soot per acre fell during one year.

According to Sir W. Thistleton Dyer's experiments at Kew, nearly 2 tons of soot per acre are deposited in London. More recent measurements, made under the control of the *Lancet* for the Coal Smoke Abatement Society, show that during the year ended June 13, 1911, a deposit of about 650 tons per square mile was received in the City area of London, and this deposit contained about 3·2 per cent of sulphate (SO_4). In the south-west district the average was 460 tons per square mile, while, on the same calculation, the fall immediately outside the metropolitan area was 196 tons per square mile. The method of measurement and analyses of the deposits were published in the *Lancet* for January 6, 1912.

In the experiments the stones which were embedded in soot were covered by a loose layer of about ½ in. thick, and it is possible that they were to a certain extent protected from damp air and rain. In further experiments it might be advisable to soak the stones

in water with which a known weight of soot had been mixed.

It is noteworthy that in Manchester, Leeds, Glasgow and other large provincial towns the rain water is acid. Analysis has shown that London rain is not acid unless contaminated by soot. This is probably a question of the amount and quality of the coal consumed per unit area of each city. In Series 3 are recorded tests, especially designed to show the effect on the strength of moisture held in the pores of the stone, also the effect of a dilute solution of ammonium sulphate. The solution used contained ·054 grams per litre—that is, about the quantity in London rain.

The tensile tests were made in an Adey machine. The specimens were measured, immediately before breaking, by means of callipers, and the minimum dimensions recorded. The compression tests were carried out at the East London College under the direction of Prof. Smith. An ordinary 50-ton Wicksteed machine was used. The specimens were protected by packing pieces of cardboard placed between each compression plate and the stone. The results of the tests are embodied in the tables; those numbered 1, 2, 3 refer to Series 1, 2 and 3, all of which are tension tests. Table 4 refers to Series 4, and records tests in compression. Table 5 records compression tests on stones containing varying amounts of moisture. Table 6 refers to cylinders broken in compression; the stones were turned to about 1-in. diameter, and were cut to a length of about two diameters.

SERIES 1.

These were briquettes broken in tension under a steadily increasing load, the rate of loading being the same for all the tests. The stones were cut without reference to their bedding planes or other special precautions. The percentage of moisture present was not recorded. Thirty-nine specimens were broken and the group averages are given in Table 1.

With respect to these averages. The stones broken without exposure formed the basis of comparison for the other groups. In this group the maximum tensile strength was 495 lb. per square inch, and the minimum was 358 lb. per square inch. This shows a variation of about 15 per cent above and 17 per cent below the mean.

TABLE I.

1	2	3	4	5
No.	No. of stones.	Conditions of exposure. 114 days—Feb. 16 to June 10, '10. 245 days—Feb. 16 to Oct. 19, '10.	Breaking load, lb. per sq. in. tension.	Remarks.
1	1 to 14	Broken after cutting and without exposure	430·7	
2	15 to 17	Outside at Westminster for 245 days	559·0	
3	18 to 20	Inside at Westminster 114 days	585·0	
4	21 to 23	Inside at Westminster, and embedded in soot 114 days	506·0	
5	24 to 26	Ditto for 245 days	615·3	
6	27 to 29	Outside at Westminster 114 days embedded in soot	434·3	
7	30 to 33	Outside at Cheam (Surrey) 114 days	467·0	
8	34 to 36	Ditto for 245 days	539·5	
9	37 to 39	Inside at Cheam (Surrey) for 245 days	633·0	

It will be noticed that stones broken after cutting had an average strength of 430·7 lb. per square inch, whereas stones kept indoors at Cheam for 245 days had an average strength of 633 lb., which indicates a normal increase in that period of about 47 per cent, so that, although all the stones subjected to exposure show some increase of strength, the effect of exposure under certain conditions was to reduce the rate of growth in strength. It must be borne in mind that in Series 1 the amount of moisture present was not measured; hence the results do not bring out the effect of the different conditions of exposure satisfactorily.

SERIES 2.

These were briquettes treated similarly to Series 1, but the percentage of moisture in the specimens was observed and is recorded in Table 2. Here, again, the dry stones broken after cutting must be taken as the standard, but comparison may also be made with Group No. 8.

The individual variations are considerable, the maximum strength exceeding and the minimum being less than the mean by 14 per cent and 9 per cent respectively. In Series 2, if the stones containing moisture be neglected, then those exposed in London show a greater loss of strength than those exposed in the country. The reduction of strength is about 16 per cent for stones embedded in soot and exposed at Westminster. It is noteworthy that Group No. 7 shows an apparently great loss of strength, but the high percentage of water present probably accounts for this.

TABLE II.

1	2	3	4	5	
No.	No. of stones.	Conditions of exposure.	Breaking load in lb. per sq. in. tension.	Remarks. Treatment.	Remarks. Per cent moisture.
1	1 to 8	Broken after cutting and without exposure	432·7	Dry	—
2	9 to 11	Outside at Westminster for 105 days	282·2	—	0·768
3	12 to 14	Outside at Westminster, but embedded in soot for 105 days	364·2	—	0·020
4	15 to 17	Outside at Westminster, but embedded in soot for 687 days	417·0	Dried	—
5	18 to 20	Inside at Westminster for 105 days	387·0	Dry	—
6	21 to 23	Inside at Westminster for 105 days; embedded in soot	390·7	Dry	—
7	24 to 26	Outside at Cheam (Surrey) for 105 days	298·8	—	1·344
8	27 to 29	Inside at Cheam (Surrey) for 105 days	402·8	—	—

SERIES 3.

These were briquettes tested to determine the effect of water in the pores of a stone upon its strength. At about 4·6 per cent moisture the stones were saturated, and in this condition their strength dropped about 40 per cent from the normal dry state. As the stones were broken in tension this loss of strength cannot be due to any form of bursting pressure by water in the pores, such as might occur with a saturated stone under a compressive load.

TABLE III.

1	2	3	4	5
No.	No. of stones.	Conditions.	Breaking load in lb. per sq. in. tension (average).	Per cent of H_2O at time of test.
1	1 to 4	In normal dry state	580·7	0·13
2	5 to 9	Saturated with H_2O and allowed to partly dry	449·9	0·32
3	10 to 14	Saturated with H_2O and broken wet	345·5	4·59
4	15 to 18	Immersed in 0·054 gram. per litre solution of $(NH_4)_2 SO_4$ for 15 hrs. and allowed to dry	558·0	0·043

The results show that in calculations as to the strength of structures built of stone, and probably of cement or brick, the amount of water present should be taken into account.

SERIES 4.

These were Portland stone cubes of 1 in. side, tested for compressive strength. The cubes were cut carefully from selected stone quarried in 1910. The tests were made in May, 1912, the stones having been exposed for a period of 373 days.

TABLE IV.

1	2	3	4	5
No.	No. of stones.	Conditions of exposure. All 378 days, May 11, 1911, to May 23, 1912.	Breaking load in lb. per sq. in. in compression.	Remarks.
1	1 to 3	Outside at Westminster	7,260	
2	4 to 7	Ditto, embedded in soot	5,890	
3	8 to 10	Inside at Westminster	6,700	
4	11 to 13	Ditto, embedded in soot	5,220	
5	14 to 16	Outside at Cheam (Surrey)	7,430	
6	17 to 20	Ditto, but embedded in soot	6,810	
7	21 to 22	Inside at Cheam (Surrey)	7,410	
8	23 to 25	Ditto, but embedded in soot	6,390	One cube omitted, ends not parallel.

There is a marked depreciation in strength of all

cubes exposed in soot. The basis of comparison for this series is the strength of stones kept within doors at Cheam, Surrey. Those kept outside at Cheam show a greater strength, but those kept at Westminster, and the stones embedded in soot show considerable loss of strength. All stones were dried before breaking.

SERIES 5.

In Table 5 are recorded tests of a series of 1-in. cubes of Portland stone broken in compression for the purpose of ascertaining to what extent various percentages of moisture reduce the strength. The series consists of four groups of six stones representing different degrees of saturation.

Group 1 are dry stones and Group 4 stones completely saturated, and containing about 4½ per cent water. Groups 2 and 3 represent incomplete saturation to

TABLE V.

1 Group.	2 Reference No. of stone.	3 Area sq. in.	4 Breaking load. Lb.	5 Breaking stress. Lb. per sq. in.	6 Per cent moisture.	7 Per cent moisture average of group.	8 Breaking stress average of group.	9 Remarks.
1	1	1·040	9,000	8,650	Dry	Dry	7,250	—
	2	1·056	7,020	7,320				Not parallel sides
	3	1·026	7,120	6,940				Not parallel sides

	17	1·047	8,400	8,030	3·27			—
	18	1·045	6,900	6,600	3·34			Not parallel sides
4	19	1·038	6,850	6,600	4·54	[illegible]	5,692	Stones were fully saturated
	20	1·038	6,200	5,970	3·87			
	21	1·040	5,960	5,730	4·71			
	22	1·030	4,420	4,280	4·71			
	23	1·023	6,000	5,860	4·52			Not parallel side
	24	1·050	6,000	5,710	4·41			—

the extent of 1½ per cent and 3 per cent respectively. For complete saturation the compressive strength is reduced about 21½ per cent from normal dry strength. For incomplete saturation the loss of strength is less, but owing to considerable variation in Groups 2 and 3 no direct relation between the percentage of moisture and loss of strength could be established.

Comparing these figures with those in Table 3 the reduction of strength in the stones broken in tension appears to be nearly twice that in compression for complete saturation, but further experiments are required before assuming this to be generally true.

SERIES 6.

These were cylinders tested in compression, and consisted of three groups.

In Group 1 were eleven stones broken dry and without exposure, having been kept for twelve months under cover. The average strength at fracture was 11,000 lb. per square inch. Group 2 were stones exposed to normal atmospheric conditions at Buckingham-gate for 153 days. These show an average strength of 10,400 lb. per square inch, while those in Group 3, which were exposed embedded in soot, show an average of nearly 10,700 lb. per square inch. It is possible that these were drier than the stones in Group 2. Groups 2 and 3 exposed outside in London both show a falling off of strength compared with Group 1, which was kept under cover in a box.

[illegible] deductions. The large variation in the strength of [illegible]

[illegible] miles distant from the city, the effect of a purer atmosphere is shown by less rapid weathering. As it [illegible] a greater distance from London this difference in the rate of weathering would have been still more marked.

Further information as to the effect of water would be of value; also the increase of strength of stone after quarrying [illegible]tion. How much is due to simple drying, and how much to actual chemical or physical change in the stone?

It would be valuable in future experiments to determine the constants of elasticity in order to see if these are changed by weathering. Should this be found to occur, it might be possible to make a series of tests upon a single specimen to investigate the

TABLE VI.

Portland Stone Cylinders, diam. 1 in., length 1·96 in.

1 Group No.	2 Stone No.	3 Breaking load lb.	4 Breaking stress lb. per sq. in.	5 Breaking stress average of group lb. per sq. in.	6 Remarks.

growth of strength with age, and thus escape the difficulties inherent in the variable qualities of the material experimented upon.

The practical bearings of these experiments need hardly be pointed out.

The defacement of national buildings and monuments has already been discussed. The experiments on the loss of strength of saturated stones are important in relation to foundations in a pervious subsoil, pier bases and monolithic structures under water. The action of subsoil water in producing land slides may be in part attributed to direct weakening of the saturated material. Then, again, water allowed to lie on road surfaces must reduce the crushing strength of the stones to a considerable extent, and these experiments emphasise the need of efficient surface and under drainage.

The erosion of our sea coast is doubtless accelerated by the weakening of the rock subject to frequent immersion under the rising tide, and to wetting by the wind-swept spray in stormy weather.

The author desires to thank the following gentlemen for their assistance in connection with the experiments: Mr. J. G. Clarke, for his help in planning and carrying out the experiments; Prof. C. A. Smith, who kindly undertook the responsibility of the compression tests; Messrs. Freak and Meadows, senior students, who performed the actual tests in the East London College Laboratory; and the author's assistant, Mr. L. A. Sellek, who also helped in making the tensile tests.

Private Tramcars. Along the streets of the [illegible] [illegible] tram lines are laid. The residents own small cars, [illegible] beside it until they are wanted again! All municipal work, such as street cleaning and the like, is done by means of large box cars drawn by oxen, and in the busier streets a special line for this slow traffic is laid on one side of the double track on which the passenger traffic is conducted. "Traffic on these lines," says the *Light Railway and Tramway Journal*, "would seem to offer many entertaining possibilities."

THE MODERN ROAD.

ADDRESS BY SIR JOHN H. A. MACDONALD.

The road problem was dealt with in a lecture given by Sir John H. A. Macdonald, one of the members of the Road Board, before the Engineering Section of the Bristol Association meeting at Dundee recently.

Sir John said he thought that was the first year in history that the great scientific societies of the land had thought the subject of the road worthy of being put forward as being connected with science at all. There was nothing that the Road Board were more anxious about than that interest should be taken by scientific men and the general public in road improvement. Enormous losses were caused to the country by the inefficient character of the road. That loss, he did not hesitate to say, amounted to millions of pounds. There was vast loss in the wearing out of traction, animals and vehicles, on the rough, uneven surface of the highway, injury to man and horses by dust, and great loss by dust which penetrated into the cases containing goods in transit, and into houses and injured furniture. The dust nuisance, he held, was being gradually diminished. There was loss from the condition of the surface of the road which permitted insanitary matter to lodge there and caused injury to health and even loss of life.

In an interesting summary of the evolution of the road the lecturer spoke of the work of the Romans and General Wade. The Roman roads were a rebuke to the roads we had been making since. The former were laid with a good bottom—well drained and covered with a good base for the actual roadway, and the roadway itself was impervious to water, which was the real enemy to the road. With the work of Macadam and Telford science came in for the first time in the making of roads. They produced a good road, but most unfortunately, when the railway began to take possession of the traffic of the country their roads came to be terribly neglected. Now the road had once more become of paramount importance. The traffic was increasingly great and would increase more and more.

MECHANICAL TRACTION.

One would have been afraid to say a few years ago, but the mechanical vehicle had conquered the road for all time, and it was absolutely necessary that they should address themselves to the consideration of what the road should be for the future. The old idea was that the traffic was to be ruled by the road. Now it was practically certain that the true way to look at the question was that the road must be ruled by the traffic.

Macadam's principle was that no water should be allowed to enter through the surface of the road under any circumstances, and that nothing should be used for binding that would absorb water. That had been completely set aside since the road maker took to using the heavy roller. The result was they had a macadam road that had no resemblance to a macadam road at all. Water was used to make the mixture that was brushed into the interstices. The road was muddy in wet weather and stones came out in dry weather, and left holes in which water lodged and caused destruction to the surface. Another evil of the present road was that there was too much camber.

The problem which had been before the Road Board and had been taken up by many first-class road surveyors was to have a surface which would not break, that would be easier for the passenger and transit of goods, and that would not form puddle holes or excite matter to clog the vehicles and form thick dust. He showed a piece of road taken from the Thames Embankment that had been down for a long time, and claimed that it showed that the desired surface had been obtained to a very practical extent. They would observe that the top was different from the rest. It was a solid mass, and when it was broken up, so cohesive was the material in which the stones were placed that the stones did not come out when it was broken they broke across with the mass.

THE CARPETING PRINCIPLE.

Macadam's idea was to have a crust made by small stones, and that crust was now made by a combination of pitch and stone. They had a new proposition that was to have a carpet for their roads. The carpet on a stair deadened the sound by limiting the vibration caused by the footfall. They wanted to do the same with the surface of the road, to protect the material below from receiving the full violence of the blow which tended to disintegration. He thought they were gradually getting to that.

ROAD BOARD EXPERIMENTS.

Sir John explained the experiments which are at present being carried out by the Road Board. He said the difficult question was the class of material to use. It was a popular idea in this country that they had only got to order a few barrels of tar from somebody, rake up the road, and pour the tar on it. It was absolutely necessary that they should get the right tar and apply it in the right way. Pitch was very good for the thick part of the road below. When they got to the top they used a very fine bitumen, and with the aid of that they made up a cover. They were hopeful that such a road, provided that the right top was put on, would never require to be touched again.

These were the steps of progress the Road Board were making, and they were hopeful, but they would not hope much unless they could be assured of the help of the public. A certain percentage of the cost of every article sold in this country was due to their bad roads, and every day they increased the quality of the roads every day they would be adding to the potential wealth of the nation. What would the nation have been without Macadam and Telford and the railways? Now they were going to have, and they must have, sound, solid, good roads. There was a great outcry as to the enormous cost, but from his point of view it was very cheap. No doubt the immediate outlay was considerably larger than to lay down a mud-bound road, but the original outlay would be more than recouped for the whole community in the course of time. The Road Board were adopting a policy of encouraging local boards to take loans at very low interest—or in special circumstances without any interest—repayable in a certain number of years. Under that policy the act al strain on the local resources would not be greater than now, and the advantages would be enormous to the whole community.

TOWN PLANNING.

THE NECESSITY OF PRELIMINARY SURVEYS.

In a paper which he read before the British Association at Dundee lately, Prof. Geddes, University College, Dundee, referred to the necessity of a survey being made before the preparations of any town-planning scheme could be satisfactorily undertaken. It was to be feared that schemes were in incubation which, whatever their particular merits, were not based upon any sufficient surveys of the past development and present condition of the towns, or upon adequate knowledge of good and bad town planning elsewhere. In such cases the natural order, that of town survey before town planning, was being reversed, and in this way individuals and public bodies were in danger of committing themselves to plans which would have been widely different with fuller knowledge, yet which, once they were produced, it would be too late to replace and even difficult to modify. Therefore, before proceeding to the preparation of a town-planning scheme, it was desirable to institute a preliminary local survey which should take into account the situation, historic development, communication, industry, and commerce, population, and town conditions and requirements.

Surveyor and "Jerry" Building.—At a recent meeting of the St. Mellons (Mon.) Rural District Council, Mr. Gomer S. Morgan, the surveyor, directed the local authority's attention to the serious consequences of approving of plans merely as a matter of form. The plans of some houses at Rumney were really valueless, and their submission was only a pretence at compliance with the requirements of the council's by-laws. "Jerry" building in its worst form had been rampant at Rumney. New streets had been formed with little or no regard for the comfort of the people who lived in the houses, and in other cases the frontage lines were so near the public roads as to render them far less commodious than they would be if proper regard were paid to the ultimate requirements of the neighbourhood. In several cases the roads had been nearly ruined, and improvements could only be effected by the expenditure of considerable sums of money. It was stated that the matter had been dealt with by the Plans Committee. A letter was read from the Local Government Board pointing out that the council's by-laws as to buildings and new streets should be brought up to date. The clerk said he would report on the subject.

The Engineer and the Community.

PROF. BARR AT THE BRITISH ASSOCIATION.

The presidential address to the Engineering Section of the British Association meeting at Dundee was delivered by Prof. Archibald Barr.

Tredgold's oft-quoted definition of engineering as "the art of directing the great sources of power in Nature for the use and convenience of man" may well be taken, and often has been taken (said Prof. Barr), as a text upon which to hang a discourse on the importance of the profession to which many of us belong, the leading part it has played in the process of civilisation, and the dependence of the world to-day on its activities. But the words suggest failures as well as achievements, and responsibilities no less than privileges. The definition suggests that the engineer not only fails in his vocation if he does not accomplish something for the use and convenience of man, but, further, that he acts contrary to the spirit of his profession if he directs the sources of power in Nature to the unuse or inconvenience of man; and surely we must understand by "man" not the engineer's immediate client, but mankind in general. The works of the engineer are to be used by some people; they have to be endured by all.

Taking the highest view of our calling—and surely we do not hold that ours is in any sense a sordid or selfish vocation—the engineer fails in the fulfilment of his duty in so far as his works are detrimental to the health or destructive to the property of the community, or in so far as they are unnecessarily offensive to any of the senses of those who are compelled to live with them. There has been too great a neglect of such considerations. The medical practitioner is held to be negligent of his duty if he acts solely in the immediate interests of his patient, and does not take due precaution to guard against the spread of disease or the offence of the community by the exhibition of unsightly forms. We should take as high a view of our responsibilities.

In his presidential address to the association last year Sir Wm. Ramsay said that the question for the engineer has come to be not "Can it be done?" but "Will it pay to do it?" The answer to this question in respect to any particular proposal depends on the width of view we take in answering two preliminary questions: Whose interests are we to consider? and what do we mean by paying? Of course, there are limits that must be set in answering each of these; my present contention is that these limits are usually much too narrowly drawn. A road surveyor may save a few pence or shillings to his county council by leaving a piece of newly metalled road unrolled—because the clock strikes the hour for retiring—and may thereby cause expense amounting to pounds, it may be to hundreds of pounds, through damage to motor cars or the laming of horses—not to speak of loss of life or limb—to the users of the road, who are, after all, the *clientèle* he is there to serve. Does it pay? The authorities of a city will spend large sums on the adornment of the streets with stately and ornate buildings and on the purchase of works of art—and rightly so, though comparatively few of the citizens can appreciate or even give themselves the chance of appreciating them, while they will tolerate, or even be directly responsible for, the running on these same streets of quite unnecessarily ugly and noisy tramcars, and congratulate themselves on the drawing of a paltry income from the display of hideous advertisements that are constantly before the eyes of the whole community. Does it pay thus to separate æsthetic from utilitarian demands and interests?

It is too much to assume that engineers could meet all the reasonable demands of their immediate clients without producing, at least temporarily, secondary effects that may be of inconvenience to some members of the community.

When we examine into the immediate causes of the injuries and inconveniences that result from our activities we find that they are due in all, or almost all, cases to failures rather than to successes. The more completely the engineer achieves the primary end of his work the less is the damage or injury that can be laid to his charge. If it can be shown that this is a very general law, as I think it can be, we may look forward to the elimination, as a direct result of progress in the mechanical arts, of the nuisances and inconveniences for which, in some measure at least, we must accept responsibility. And not only so, but the converse will be equally true—the more we keep in view the removal or avoidance of anything that can cause offence, the more rapidly we shall advance in the attainment of the primary ends at which we aim. Consider, by way of example, the nuisance of which we hear so much—the raising of dust by motor cars. I shall not discuss the debated question as to how far the motor car produces dust, or only distributes it, nor shall I deal in detail with the possible remedies. We hope to have a paper on the subject at this meeting from one of our leading authorities. For my present purpose it suffices to point out that it is no part of the function of a road surface to fritter itself down into dust under traffic of any kind. The ideal road would be one that would not wear at all, and the nearer we approach this ideal of a permanent road surface the less will be the inconvenience caused, not only to those responsible for the upkeep of the road, but to the general public. And, conversely, the more attention we give to the devising of a dustless road the more rapid will be our advance towards the provision of one best suited for all the purposes which a road is intended to serve. We had dusty roads before the motor car came into being, but the demand that is being forced upon the engineer to eliminate this nuisance is leading to an improvement of our roads for all users. The inventors of the automobile will yet merit the thanks even of those who, bemoaning the blatant intrusion of science into our lives, may discard the railway train and the motor car and take to the stage-coach of their grandfathers with a view to the recovery of some of the lost repose.

Again, the combustion of fuel does little harm to anyone; it is the imperfection of the combustion that is the main cause, almost the sole cause, of injury to health, to property, and to the amenity of populous centres. Of course, one knows that smokeless combustion is not necessarily, nor always, the most economical, but that is only because we have not yet learned how to use fuel in anything like a perfect manner. But all the tendencies at the present time are towards improvement, and the more attention we pay to the elimination of the smoke nuisance the more rapid will be our progress in the economical use of one of the most valuable of our inheritances. It is therefore clearly the duty of every engineer who has to do with power or heat production—for the credit of his profession and even in the interests of his immediate clients—to consider the use and convenience of all who can be affected by the work for which he is responsible. The time is not far distant when the direct burning of bituminous coal in open grates will be looked upon as not only a source of serious harm, but as a culpably wasteful practice. Great progress has been made in processes for the partial distillation of coal by which a free burning and quite smokeless fuel is prepared and valuable by-products (so-called) are conserved. If all engineers concerned with the design and application of plants in which coal is used had a due sense of their responsibilities to the community, progress would have been, and would to-day be, much more rapid; and economies would be effected that would, in themselves, amply justify the application of more scientific methods of utilising the constituents of a very complex material, which we are too apt to look upon as merely a convenient source of heat—plentiful enough and cheap enough, as yet, to be used in a most wasteful manner. It will not be to the credit of our profession if it should require restrictive legislation not only to prevent a gross interference with the health and comfort of the community and the amenities of our centres of industry or of population, but to effect economies in the utilisation of the chief of the sources of power which it is our function to direct to the best advantage of all concerned.

After expressing the opinion that in the near future the power and heat required for domestic purposes will be distributed in a perfectly inoffensive manner from large central stations, and pointing out that the appeal to selfish interests, which would be one means of attaining this end, is not inconsistent with Nature's method of securing progress, Prof. Barr proceeded:—

"It is just a hundred years since passengers were first carried on the Clyde in a mechanically propelled ship, and to-day—when they are not too completely obscured by smoke—we can see the successors of the 'Comet' plying on that river with power plants of

greatly superior overall efficiency, but showing little advance in regard to the combustion of the fuel. Had the emission of smoke from river craft been prohibited years ago, there is little doubt that engineers would have let few days pass without arriving at some solution of the problem of inoffensive power production, and the demand for economy would have looked after itself. How much better it would be were engineers to take the wider view of their duties and responsibilities to which I have referred, and realise that they are acting contrary to the true spirit of their profession when they produce appliances that pollute the atmosphere for miles around to the hurt and inconvenience of those whose 'use' they are intended to serve! But this year a ship has left the Clyde that we hope may be the forerunner of a new race which will attain a higher efficiency than any of the direct descendants of the 'Comet,' and that will ply their trade without inconvenience to man or beast, who can claim some right to be permitted to enjoy an unpolluted atmosphere and the measure of sunshine which Nature — sparingly enough in those regions—intended to provide."

After dealing with the subject of offences against good taste and the sense of the beautiful, especially as exemplified by the lavish embellishment of some early steam engines, Prof. Barr said:—

"There are, and must always be, wide differences of opinion regarding what is good or bad in matters of taste, but we may go so far in generalisation as to say that we can admire the association of elements we know to be incongruous only in compositions that are intended to be humorous. . . .

"There are lengths to which even artists will not go in the arrangement of elements in a composition. But an artist will secure a colour scheme at which he aims by the introduction into his landscape of a rainbow in an impossible position, or of an impossible form or dimensions, or with colours arranged according to his own fancy, though in this there is a much more essential unreasonableness. A polar bear might be transported to the desert and an Arab might conceivably find his way to the regions of snow and ice, but a rainbow cannot wander from the place assigned to it by Nature, nor can it have other than the ordained form or dimensions or sequence of colours. No artist would paint a figure holding a candle and make the light fall on the side of the face remote from the source, but he will, and usually does, paint the moon illuminated on the side remote from the sun. Why? Simply because he has not before his mind the essential absurdity of the scheme, if indeed he knows why the moon shines. Artists, who deal with Nature in any of its aspects may be commended to 'mark, learn, and inwardly digest' Whistler's definition of their calling: 'Nature contains the elements in colour and form of all pictures . . . but the artist is born to pick and choose, and group with science these elements that the result may be beautiful.' Whether or not we are to understand that Whistler intended to include an accurate knowledge of physical facts and phenomena in what he calls science, he cannot have meant anything less than sense. . . .

"The only valid excuse for such departures from the fit and rational in painting or in structural design as those I have instanced is ignorance on the part of the designer of the nature of the elements he employs, or a lack of skill to devise a possible or reasonable arrangement of details that will secure the general effect he desires. . . .

"Our works—like the highest creations in Nature—should be beautiful and not beautified. . . . The practice of resorting to extraneous adornments to minimise crudities of structural scheme had its rise—if I mistake not—in the comparatively recent times when culture and taste were at their lowest. It is specially characteristic not only of earlier times, but of the earlier stages of the design of any particular product. It has already disappeared in some cases, and will continue to disappear from the practice of the arts of construction as skill and taste develop. . . .

"I have already alluded to the abandonment of ornament in the design of machines, and I think there can be no one with any sense of the fit and pleasing who does not approve this change in practice. The stage coach and horses of former times were lavishly decorated—the carriage of to-day is more graceful and pleasing in virtue of the simple elegance of its lines. In the best domestic architecture of to-day we see the same tendency to trust for effect more and more to an artistic grouping of the lines and masses of essential parts and the gradual abandonment of purely decorative features without and within. There was a time when the hulls and riggings and sails of ships were lavishly ornamented; now even the figurehead—the last remnant of barbaric taste—has disappeared; and do we not find in a full-rigged ship of to-day—or yesterday, perhaps, one should say—a grace and dignity that no extraneous embellishments would enhance? From the racing yacht the designer has been forced, by the demand for efficiency, to cast off every weight and the adornments that so beset the craft of earlier times, with the result that there is left only a beautifully modelled hull, plain masts, and broad sweeps of canvas, and we can hardly imagine any more graceful or beautiful product of the constructive arts. These examples will serve to illustrate the contention that the attainment of the highest efficiency brings with it the greatest artistic merit. . . .

"It is a matter of constant remark, and with justice, that steel bridges, as a class, are much less pleasing to the eye than those of stone. The building of stone bridges is an ancient art, and survival of the fittest and selection—even with little creative skill on the part of the designers—would have led to the development of types having, of necessity, at least the elegance of fitness. But, further, this art has come down through the times to which I have referred, when artistic and utilitarian aims had not yet been divorced in the practice of the crafts; and, further still, the practice of building in stone has been in the hands of architects, as well as of engineers, and architects are expected to be artists, and are trained as such. On the other hand, construction in steel is a very modern art, and it has been in the hands of engineers who usually neglect, if they do not despise, the study of the fine arts. But why have architects, with their artistic training, not succeeded in producing artistic structures in steel as admirably as those they design in stone? Partly, no doubt, because they are hampered by tradition. They have not yet fully realised the difference in spirit that must characterise fit designs in the newer and the older materials. No one can be an artist in any material the possibilities and limitations of which he has not fully mastered. Again, if a common engineer may venture the criticism, the architect, as a rule, has not sufficiently mastered the science of construction, and has been too much addicted to taking the easy course of adopting a decorated treatment instead of striving to secure elegance of structural scheme as such; and decoration, at least on anything like traditional lines, is wholly incompatible with the best possibilities of steel as a structural material. Progress is being made in the art of designing efficient and graceful structures in metal, but the best results can only be attained by a designer who has a thorough scientific and technical knowledge of the properties of steel and the process of its manipulation, on the one hand, and cultured artistic sense and capacity on the other. These should not be considered as appropriate equipments for separate professions."

Water Filtration at Tynemouth.—At the next meeting of the Tynemouth Town Council a recommendation in favour of installing mechanical filtration for the purpose of removing the stain from the water supplied to the public will be submitted.

Birmingham Tramway Car Experiment.—An experiment will shortly be made on one of the routes of the Birmingham Corporation tramways with a single-deck car so constructed as to afford standing room for seven passengers on the platform at each end.

Bridge Building.—Students, young engineers, and surveyors will find much useful information in "Preliminary Studies in Bridge Building," by Reginald Ryves, ASSOC.M.INST.C.E. (London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.) The book is described as the "first of a series of small volumes, each complete in itself, dealing with the design of ordinary highway bridges of moderate span." Though highway bridges alone are referred to, the matter contained in this volume is largely applicable to railway bridges, aqueducts, and similar engineering undertakings. The five primary types of bridges are described, and the conditions determining the best site for each of the three types of streams are discussed in detail; while, in connection with wandering streams various modes of designing abutments or approach spans are dealt with. Improvements of fords and the effect of eccentric loading of vehicles on the girder loads are among the numerous other items touched on. *Scotsman.*

Highway Bridges and Culverts.

[Extracts from Bulletin No 43, a revision of Bulletin No. 39, United States Department of Agriculture, issued by the United States Office of Public Roads, by C. H. Hoyt, formerly superintendent in charge of bridge engineering, and W. H. Burr, consulting engineer, Office of Public Roads.]

Comparatively little attention has heretofore been given to the design of highway bridges, and the result has been disastrous in many instances.

The relation of culverts and bridges to the general movement for the improvement of our public highways is intimate. The desirability and economy of building these structures of durable and permanent material, or according to intelligent or economic design, has not thus far been actually recognised in practice throughout the United States. The expensive and unsatisfactory method of repairing the old and inadequate structures of the past or of fording the streams is still continued.

Modern traffic now demands that the construction of bridges and culverts shall keep pace with industrial development. The administration of these matters in the United States is placed largely in the hands of local officials, who are scattered as individual units throughout the country. In many of these localities the amount of this class of work under the jurisdiction of one local official has apparently not been sufficient to warrant securing the services of a capable engineer in connection with this work.

The work of the Office of Public Roads, Department of Agriculture, is for the purpose of securing the improvement of all public highways throughout this country, and in connection therewith highway bridges and culverts should be given their full share of attention. In consequence, the office will send an engineer whenever practicable to confer with local officials, upon their request, concerning this class of work; to make inspections, recommend such types of construction as are adapted to given locations, and give such other information and assistance as may be practical in the individual case.

In addition to this it is intended to issue other bulletins giving designs, specifications and general information for small culverts and bridges.

The plan to be observed should consist of steps such as the following:—

(1) The services of a capable bridge engineer should be secured.

(2) The foundation should be tested to determine its suitability, bearing power, and economy.

(3) The location should be determined within a close approximation, and a profile of the center line made showing also the results obtained by testing the foundation.

(4) The loads which the bridge may be called upon to carry safely, anticipating reasonably the demands and growth of the future, should be decided upon. All highway bridges, at least those on main roads, should be designed to carry concentrated loads, such as road rollers or traction engines weighing from 10 to 15 tons each, with a reasonable factor of safety. Unfortunately for the traffic of to-day, many of the present highway bridges were designed to carry only moderate uniform loads, and this accounts for their light appearance and their inadequacy to meet present demands.

(5) After these facts have been determined, the engineer will be able to prepare plans for the foundations, abutments, piers, and the bridge itself, all of which may be designed to meet economically the conditions of the location selected. An estimate of the cost may be made, and this should in all cases be used as the basis for an appropriation for the bridge.

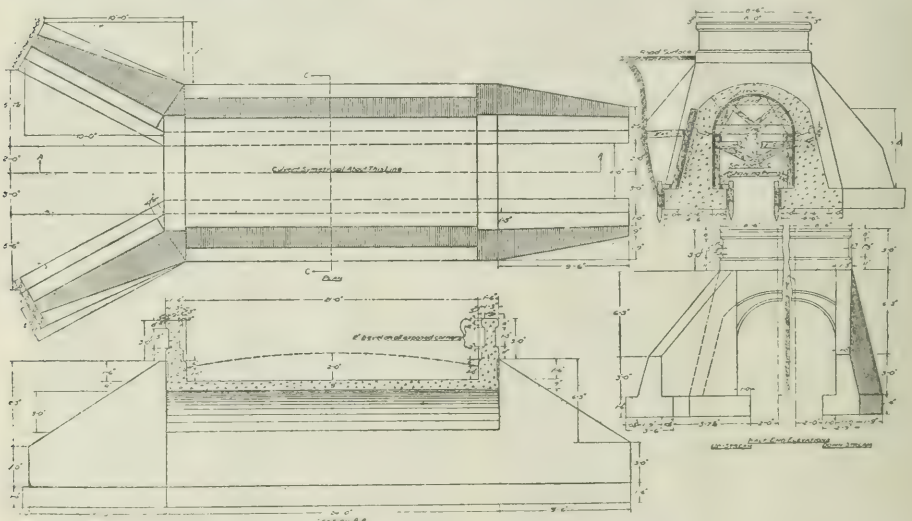

FIG. 1.—A PLAIN CONCRETE ARCH CULVERT, 6 FT. SPAN.

Quantities.

Concrete:	Arch and parapets ..	1—2 – 4	12·9 cubic yards.	Required:	Portland cement	10·2 barrels.
	Side, end, and wing walls	1–2½–5	39·8 „ „		Sand	33 cubic yards.
	Footings	1–3 –6	20·1 „ „		Stone or gravel	66 „ „

FOUNDATIONS.

The question is much involved, and it is difficult to treat it satisfactorily in the limited space which can be given it here. . . . For many of the smaller box culverts of spans varying from 2 ft. to 8 ft., and carrying only ordinary loads, the ordinary earth foundation [bed] is sufficient in most cases, with proper protection against undermining by currents of water. Where the streams are sluggish, however, or where the culverts are located in swamps, and the foundations [underlying soil or strata] are soft and wet, a few logs from 10 to 12 in. in diameter, which are placed below in trenches, and upon which the footings rest, add much to the stability of the foundation. . . . The suitability of foundation [soil or strata] for the more important structures can be safely determined only by tests. This can be done best by digging test pits wherever conditions will permit. . . . Where conditions do not permit test pits, an iron rod may be driven to depths of from 10 to 20 ft., unless rock is encountered before that depth is reached. This method, however, gives very little idea of the material through which the rod is driven. A somewhat better way is to drive down 1-in. extra heavy iron pipe, which may be cut into 4-ft. lengths and coupled together as driven. A driving cap should be provided, and the

driving should be done with wooden mauls. Pipe has been driven in this manner in the winter months to depths of about 30 ft., or possibly more. The pipe, after being driven, may be pulled out with a small chain and lever, so that a sample of the material through which the pipe was driven may be brought up inside it. This material can then be examined as the pipes are uncoupled and cleared out.

Arch bridges or culverts especially require an unyielding foundation, and are more than likely to fail unless such is provided. Consequently, they should not be built except where a good rock or gravel foundation is to be had, or possibly where a satisfactory foundation can be made by driving piles. Attention should be called to the fact that piles may be driven in an inclined position, and thus be able to resist the arch action directly.

MASONRY ARCH BRIDGES AND CULVERTS.

[The arch] is a type of structure which should not be undertaken by inexperienced builders, or with haphazard methods. The services of a capable engineer should be secured, and, with proper materials, thorough construction, and favourable local conditions, the arch is an economical and desirable type of bridge construction. The illustration (Fig. 1) is made from a working plan prepared in the Office of Public Roads for a plain concrete arch culvert with a 6-ft. span, which may be of service more often than those of larger spans.

The reinforced concrete arch has an advantage over the plain concrete arch in the fact that the curve of the reinforced structure may be made more nearly flat than the plain concrete arch, and thereby save in the total height of the structure. This permits it to be used where it otherwise could not be. Under favourable conditions there may be an additional advantage in point of economy, although this cannot be stated generally as true in all cases.

The steel reinforcement in the arch serves the same purpose as in the concrete slab—that is, to increase the strength of the arch rib where the concrete has excessive tensile stresses. In some cases, however, the concrete is also reinforced against compression. It is also possible, when steel reinforcement is used, to reduce the quantity of concrete in the arch rib from the amount that would be required for a plain concrete arch.

STEEL TRUSSES.

There are still a few types of trusses used to which are given the names of their original inventors or proposers, such as the Pratt truss, the Howe truss, or the Warren truss, as well as some others.

Formerly the Howe truss with upper and lower chords and compression web members of timber, but with wrought-iron tension web members, was extensively built. It has now gone out of use, except in some remote districts where economy of first cost is absolutely essential. In these bridges cast-iron joint blocks were used at the joints where the web members intersected the chords.

The Pratt type of truss, more or less modified frequently in consequence of the varying depth of truss, is much used, and makes an excellent style of bridge. It is adapted to almost any length of span from 100 ft. up.

The Warren truss with riveted joints, formerly much known as "a lattice girder," is an excellent bridge for highway purposes for lengths of span from 60 or 70 up to 100 ft. or more in locations where the plate girder would be too expensive. In fact, except for locations where the operation of riveting in the field is too troublesome or expensive, this type of bridge has great excellence for almost any length of span up to as much as 200 ft.

I-BEAM AND CONCRETE SPANS.

One of the best types of culverts for spans from 10 to 30 ft. long is the steel I-beam incased in concrete, upon which rests a relatively thin concrete slab which forms the cover for the culvert. The slab is designed to carry the load for a span equal to the distance from centre to centre of the steel I-beams, while the beams are designed to carry the load over the clear span from one side wall or abutment to the other.

Among the best features of this type of construction are its safety and ability to withstand severe and unfavourable conditions, such as the unequal settlement of abutments, which may cause cracks in the concrete that would cause other types to fail. In this type, however, the load is carried principally by the steel I-beams, whose strength is not destroyed by the settlement of the abutments.

Many structures of this type have been built without incasing the I-beams in concrete, but by merely painting the beams instead, to protect them from rust. The painting, however, must be repeated every few years, at some considerable expense. There is, of course, a great possibility that this painting may never be done, and the better way is decidedly to incase the beams in concrete during the construction, and thus protect them permanently.

This type also admits of arch construction between the beams for the floor system. By this means space may be saved in the depth of the floor system that may be of value in locations where the area of the waterway or the "head-room" is a controlling factor.

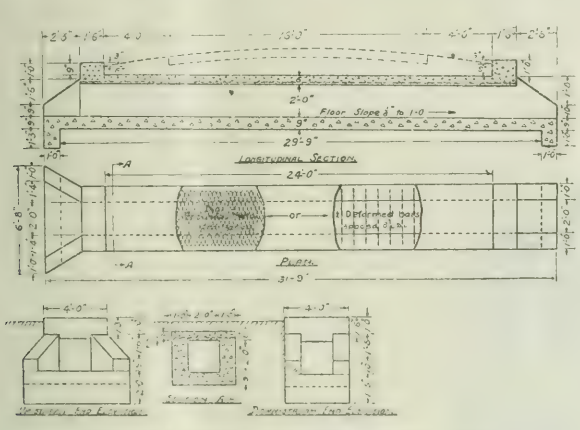

FIG. 2.—A CONCRETE BOX CULVERT, 2 FT. SPAN.

Quantities.

Concrete:	Top and parapets	1–2–4	2·4 cubic yards.
	Side and wing walls	1–2½–5	4·6 ,, ,,
	Footings	1–3–6	4·0 ,, ,,
Materials required:	Portland cement		16 barrels.
	Sand		5 cubic yards.
	Stone		10 ,, ,,
	Expanded metal, No. 10, extra heavy		96 square feet.

Alternatively, 41 ½-in. def. bars, ¾ sq. in. nett area, 3 ft. 6 in. long = 122 lb.

The length of the spans over which reinforced concrete slabs may be built within the limits of practicability and safety depends much upon the loads to be carried. The depth and amount of fill over the culvert, which may distribute the effect of the concentrated load is also an important factor.

On main roads, where concentrated loads, such as road rollers or traction engines, are to be provided for, and the depth of fill over the culvert is sufficient only to provide a cushion of earth from 1 to 2 ft. in depth, the concrete slab is practical for spans up to about 10 or 12 ft., while for greater spans than this, under these conditions, other types better adapted to the longer spans should be used.

Under conditions of less severe loading the spans for the slab may be increased up to 16 or possibly 20 ft., but it does not seem advisable to use them for these greater spans in view of the possibilities of a nominal future growth of traffic requirements.

BOX CULVERTS.

The box culvert gets its name from its similarity to a box with open ends. It has a floor, which may be of plain concrete or may be paved with stone. The two sides and wing walls at the two ends may be of plain concrete or reinforced with steel, but the cover and parapets should always be of reinforced concrete.

The sketch shown (Fig. 2) is made from a working plan prepared in the Office of Public Roads for a con-

crete box culvert, which has an opening 2 ft. wide by 2 ft. high, and forms one of the set of standard plans.

This type of construction is practical under the majority of conditions for spans up to about 8 ft., which, as a matter of fact, forms a large percentage of all the culverts needed. Conditions may occur where it will be practicable to apply the box type, with some modifications, to greater spans than those mentioned, such as where the foundation is soft or liable to much erosion from swift currents. The floor may then be reinforced with steel, so that it will have greater strength to act as a beam to distribute the load over a greater area. It may also be extended back of the side walls to act as a footing. With suitable "cut-off" walls to prevent currents of water from running beneath this floor, the foundation will be well protected from erosion.

ARTISTIC TREATMENT OF FERRO-CONCRETE.

THE NEW COUNTY BUILDINGS, SHREWSBURY.

A recent example of artistic work in ferro-concrete is furnished by the new County Buildings at Shrewsbury, erected by Mr. T. Pace, of Shrewsbury, from the designs prepared in the office of the county surveyor, Mr. A. T. Davis, M.Inst.C.E., by Mr. A. E. Williams. This handsome range of buildings is constructed with ferro-concrete floors throughout, in accordance with the Hennebique system, and the designer has made a very happy use of the characteristic features of the floor construction in the decorative treatment of ceilings. Instead of attempting to hide the main and secondary beams, as is too frequently done, these details (says *Ferro-Concrete*) have wisely been allowed to remain in full prominence, thereby expressing the structural idea of the design, giving evidence of the strength it embodies, and at the same time avoiding those wide expanses of flat ceiling which are so difficult to treat satisfactorily.

Shrewsbury County Buildings.

In the more important apartments the main and secondary beams are richly ornamented by moulded cornices and panels in relief on the under side, while the rectangular panels into which each ceiling is divided are similarly decorated by more or less elaborate scroll work. In rooms where decorative effect is not a prominent desideratum, the ceiling treatment is more simple, but equally satisfactory.

The floors were tested after completion by loads of 2 cwt. per square foot of area, being 50 per cent in excess of the calculated load. The deflection registered was only half of 1 millimetre, which was considered to be highly satisfactory. Working details for the ferro-concrete construction were prepared by Messrs. L. G. Mouchel & Partners, of Westminster, and the work was carried out under the supervision of Mr. A. E. Williams, Shrewsbury, by the Liverpool Ferro-Concrete Contracting Company, Limited, of Bixteth-street, Liverpool, who have carried out numerous large contracts on the Hennebique system.

The Law as to Temporary Buildings.—Twickenham Urban District Council succeeded last week in procuring a conviction against a defendant for erecting a temporary building at Eel Pie Island. The building had actually been moved on two occasions, and the surveyor to the council, Mr. F. W. Pearce, admitted that if the structure were used as a bowlhouse or a dog kennel proceedings would not have been taken. Mr. Firth, defending, said it was intended to put the structure on wheels, and it would be in the same position as a coffee stall or a watchman's box.

STATISTICAL PITFALLS.

THE EFFECT OF "MAINING" UPON AVERAGE COSTS OF ROAD MAINTENANCE.

While figures by themselves cannot lie, they lend themselves very readily to the *suggestio falsi* which arises from a *suppressio veri*. Some of the prettiest examples of this are furnished by the numerous cases in which the mean of means is not the mean of the lot, and the following purely imaginary case may be taken as an example of the extent to which we may be led away by conclusions as to a mean rate if we fail to note what are the quantities to which the rates refer.

In the county of Loamshire there were in the financial year 1902-3 500 miles of main roads and 1,000 miles of district roads. Half of the latter might be classed as "secondary" and the other half as "tertiary." The costs of these roads per mile per annum were: Main roads, £80; secondary, £40; and tertiary, £20.

The county surveyor reported that efforts were being made to reduce the cost, and the secretary of the district Surveyors Association said the same with regard to district roads. The editor of the *Loamshire Gazette* wrote: "The roads of Loamshire have cost £46 13s. 4d. per mile in the year 1902-3."

During the next three years a policy of "maining" was carried out, and by April, 1906, 500 miles of the district roads, those of the "secondary" class, had been mained. At the end of the financial year 1906-7 the following passage appeared in the report of the county surveyors: "The cost of maintenance of the main roads maintained by the county has been reduced from £80 per mile in 1902-3 to £70 per mile in 1906-7." The secretary to the District Surveyors' Association reported: "The cost of maintenance of district roads has been reduced from £30 per mile in 1902-3 to £25 per mile in 1906-7."

The editor of the *Loamshire Gazette* wrote: "The cost of maintenance of roads in Loamshire has risen from £46 13s. 4d. per mile in 1902-3 to £55 per mile in 1906-7." Thus a decrease of £10 per mile in the cost of main roads and a decrease of £5 per mile in that of district roads was accompanied by an increase of £8 6s. 8d. in the cost of maintenance of all the roads of the county taken together, this being due to the fact that during the three intervening years 500 miles of road had been transferred from the district councils to the county council. If the average cost of all the roads had remained unchanged, the £80 per mile might have been reduced to £60, and the £30 a mile for district roads to £20 per mile. This can best be shown in tabular form as follows:

Cost of the roads of Loamshire in 1902-3.

Main roads, 500 miles at £80	... ...	£40,000
District roads { 500 miles at £40	... ...	20,000
District roads { 500 miles at £20	... ...	10,000
All roads, 1,500 miles at £46⅔	... ...	£70,000

Cost of the roads of Loamshire in 1906-7.

Main roads, 1,000 miles at £70	... ...	£70,000
District roads, 500 miles at £25	... ...	12,500
All roads, 1,500 miles at £55	... ...	£82,500

Same total cost as 1902-3, *but with lower costs for both classes.*

Main roads { 500 at £80 / 500 at £40 } 1,000 at £60	...	£60,000
District roads, 500 at £20	... ...	10,000
All roads, 1,500 at £46⅔	... ...	£70,000

The main roads reduced by 25 per cent, and the district roads reduced by 33⅓ per cent, the average cost per mile remaining the same.

In case the above examples may be regarded as beyond the region of ordinary experience, let us take a similar case, but one in which only 100 miles of district roads are "mained":

Actually.		*Before "maining."*	*After "maining."*
500 miles at £80	£40,000	500 miles at £80	600 miles at £73⅓
100 miles at £40	4,000	1,000 miles at £22	
900 miles at £20	18,000		900 miles at £20
1,500 miles at £41⅓	£62,000	1,500 miles at £41⅓	1,500 miles at £41⅓

Thus, the transfer of 100 miles of district roads to the county results in a reduction of £2 per mile in the cost of maintenance of district roads, and a reduction of £6 13s. 4d. per mile in the cost of county roads, without any physical change whatever, every mile of road in the county costing exactly what it did before.

IS THE ROAD BOARD A FAILURE?

An article in the *Westminster Gazette* of the 17th inst. upon "the policy of the Road Board" alleges that "the second report of that body shows conclusively that not only has the Board not proceeded to carry out the work assigned it by the Chancellor and sanctioned by Parliament, but that it does not intend to." The indictment then proceeds to assert that:—

(1) The Road Board only concerns itself with town-planning schemes and colossal projects, for which over £1,000,000 has been earmarked.

(2) It has made no effort in the direction of deviating roads, "clipping hedges," removing the dangers of sharp corners, or widening or straightening roads.

(3) That all they have done is "to splash tar about" and "polish the surfaces" of main roads, thus attracting the traffic to them and increasing the speed and danger.

(4) That secondary roads have been neglected.

(5) That tarring the roads has ruined the panels of hundreds of motor cars!

(6) That "the dangers and more [*sic*] of old roads still exist, while over £2,000,000 is misspent in the Road Board coffers."

(7) That "Colonel Crompton, as consulting engineer to the Road Board, seems to have been deeply influenced by the Roads Improvement Association, which is concerned mainly with revolutionary projects involving from £500,000,000 to £100,000,000."

The remedy for this terrible state of things is to be either the formation of a "Road League" or a National Road Council, but how the constitution of either, or both, of these bodies is to make all things bright and beautiful is not very clear.

The writer also does not like the Road Board's practice of advancing money on loan; he says that these methods are "undignified," and that instead of this the money should be given conditionally, and that prizes should be offered for the most economical schemes of road improvement.

This suggestion is apparently on the same principle as the prizes given to station masters for the best gardens at railway stations!

Finally it is stated, "What the Road Board really requires are the services of a thoroughly practical and enterprising travelling inspector, whose business it should be to eradicate the mid-Victorian ideas of unprogressive local surveyors and educate them in road reforms," and the name of Mr. Maybury is suggested as the right man for such a post.

The article concludes with the following tirade:—

"In a word, the Road Board has failed, and the most deplorable thing of all is that, while millions of pounds are being hoarded up, the appalling list of casualties to innocent [*sic*] pedestrians, and especially to children, which the Chancellor referred to in 1909, has increased tremendously."

Looking at the work of the Road Board dispassionately can we agree with the writer of this article and say the Road Board has failed? The answer will most assuredly be in the negative. When it is considered that the board cannot deal in an autocratic manner with the roads in the manner suggested by the article, but have to approach the road authorities with tact and judgment, it is really surprising to find what an immense amount of work has been accomplished. The improvement in our roads during the last two years has been phenomenal. The policy of the board has been to improve the surfaces of the roads so as to meet the exigencies of the case, and they have succeeded in doing so. It is all very well to fling out exaggerated statements and to make assertions which cannot be proved, and the article bristles with these.

For instance, is it a fact that

(1) The board only concerns itself with town planning schemes? We have yet to learn that the board has concerned itself in one single scheme of the kind.

(2) A considerable number of "deviations" and by-pass roads have been done under the auspices of the Road Board and with regard to "clipping hedges" the writer of the article must know that the board have no legal power to do this work or to report upon its being done by the local authority. A large number of sharp corners have been improved, and other road improvements carried out. The statements under this head are absolutely contrary to the fact.

(3) As to "splashing" tar, this is a feeble witticism, no more worthy of argument than the general allegation that "hundreds" of motor cars have been ruined by tar.

With regard to the remaining indictments, they require no comment, and we can safely leave them to our readers to judge for themselves.

We hold no brief for the Road Board, and they no doubt are well able to take care of themselves, but we draw attention to the article with a view to encouraging correspondence on the subject, and possibly a useful discussion as to whether the article summarised contains an atom of convincing proof that the Road Board is a failure.

CHLORINATION OF WATER AT CLEVELAND, OHIO.

Dr. D. D. Jackson, of New York, in a paper read before the American Waterworks Association, gives some very interesting particulars concerning the results of the application of hypochlorite to water for sterilisation.

It appears that when the water of Cleveland was first treated with chlorine, in September, 1911, unpleasant tastes and odours were noticed at times. Investigations proved that these were due to the use of an unnecessarily large amount of chlorine, and the quantity applied was therefore reduced without loss of efficiency in the removal of disease germs. This efficiency appears to have been well proved, not only by laboratory tests, but by the fact that "while ice movements in April caused specific infection of the water supply at the intake during those days, yet there was no accompanying rise of typhoid in the city." The sewage-laden ice from the river and harbour has infected the water supply on several occasions, so that, although the supply is now generally pure, it is essential to sterilise the water at times when pollution is inevitable.

Dr. Jackson recommends, in order to insure the use of standard amounts of chlorine when a sudden increase or decrease in pumping takes place, that an automatic device should be installed which will regulate the flow of hypochlorite solution directly in proportion to the flow of water, and that chlorine gas made from the electrolysis of common salt should be used experimentally in place of the chemical solution hitherto applied. He estimates the cost of the installation for Cleveland at £417, and the cost of treatment at from 1s. 8d. per 1,000,000 gallons to 1s. 0½d., according to the scale upon which the liquid chlorine is made.

The daily supply is about 70,000,000 gallons, and from 11 lb. to 18 lb. of hypochlorite is used corresponding to an amount of chlorine from 0·5 to 0·7 parts per 1,000,000. This amount has been found to be quite sufficient. At Jersey City 0·35 parts per 1,000,000 are found to be sufficient; the same amount is used at Cincinnati. At New York 0·5 parts are used for the Croton supply, and 0·6 parts in the Bronx supply.

It is now proposed to use compound chlorine, liquefied under pressure, which is sold in 100-lb. cylinders, at about 4d. per lb. This is about double the price of hypochlorite of lime, as far as available chlorine is concerned, but it is so much more easily applied, and is stated to possess so many advantages over the chemical that the extra cost is outlimited. The gas passes direct into the flowing water, and is there absorbed. There are no tanks and no lime sludge, and practically no labour.

It is interesting to note that in the year following the installation of the new intake at Cleveland the typhoid death-rate fell from 48 per 100,000 to 15, and that since then it has averaged 16 for seven years. This once again shows the value of pure water, but the authorities at Cleveland, finding that sewage pollution was taking place occasionally for short periods, wisely determined to eliminate the risk, and therefore adopted sterilisation.

"The Three-point Problem in Surveying."—Mr. W. N. Thomas writes: "In the article on "The Three-point Problem in Surveying," which appeared in your last issue, I regret that my brief description of a station pointer is rather misleading. Two only of the three arms are fitted with clamps, tangent screws and verniers, as shown in Fig. 1. The third arm is fixed so that its fiducial edge coincides with the zero of the circular scale, which is graduated in both directions from this point to 180°.

CORRESPONDENCE.

Error a fault and truth discourtesie"
— Geo. Herbert, *"The Temple."*

SEWER VENTILATION.

To the Editor of The Surveyor.

Sir, In your reference to my work on "Sewer Ventilation" on page 361 of your last issue, you describe sewer ventilation as a vexed problem. My experience has been that the reason of this is because the principles of so many branches of science are involved.

To deal with the subject in its complex nature, the whole experience of the engineer, chemist, bacteriologist and meteorologist are needed to enable the ventilating engineer satisfactorily to complete his work.

The difficulty has been in the past that most reports, statements and investigations have dealt with the matter singly, and not conjointly. For instance, a bacteriologist's paper or report would deal with it purely on the rules of bacteriology, taking no account of the pneumatic action in the sewer, which comes within the practice of the civil engineer. Not one in 10,000 has sufficient knowledge of bacteriology to judge the correctness or otherwise of the report, so this statement would be taken as correct. Singly it probably would be; but collectively it leaves the question as bad as before as far as the public health is concerned.

Take the following illustration. Some ten years ago a well-known engineer laid down the theory that sewers of a good gradient, with shafts of a moderate height, would prevent the sewer gas evil. Had the scheme been thrashed out by our chemists and bacteriologists, as well as by our engineers, its weakness would have at once been seen, and the expense of erecting shafts which have since been scrapped would have been avoided.

Another engineer, in one of the most recently published books on sewer ventilation, works out the cost at so much per mile of sewer, not taking into account the volume of the gases which have to be dealt with. Had he been co-operating with a chemist he would have found that in a mile of one of our large London sewers there is as much work to be done as in 132 miles of ordinary 12-in. pipe-sewer. So that the number of ventilators required for any given length of sewer must of necessity depend upon the work to be done in the sewer.

From a chemical point of view, I am of opinion that the paper read by the president of the British Association at Dundee will not only be of considerable help in forwarding the work of sewer ventilation, but will be an immense service to sanitation in general. The compounds which the professor stated are so essential to prolong or give life are those which happen to be destroyed to some extent by coming into contact with gases discharged from sewage. So that, if we allow those compounds to be destroyed in any way, we deprive the public of some of the means necessary for the prolongation of life.

But the main question as regards the public is efficiency and expense. Persons reading your reference to the cost of the apparatus at Kensington may form the opinion that the system is a costly one. The £19 quoted for this work more than covered the cost, and included the price of the ventilator, special manhole cover and dust box, excavating, laying on water supply, and making good the road. The annual outlay of £3 10s. for maintenance includes the cost of the pinhole of water for motive power, chemicals, and the monthly inspection of the apparatus by one of my men.

The consumption of water for the motive power for a district of apparatuses has been found to be less than that previously used for watering the streets for laying the dust. Thus, the expense of working an isolated ventilator in one of the worst places cannot be taken as a proportional cost of treating a whole district of sewer emanations.

Competent engineers have stated that, taking the benefits derived from good sewer ventilation as compared with the outlay, it is the cheapest thing they have ever had. This, I think, proves that sewer emanations can be got rid of by good sewer ventilation, at very little cost to the public.—Yours, &c.,

R. H. Reeves.

Walton Mill,
Walton-on-the-Naze,
Essex.

INTERCEPTING TRAPS.

To the Editor of The Surveyor.

Sir,—I was glad to see in your last issue a letter signed "M.Inst.C.E." His views coincide with my own. If the trap is useless, nay, more, is an evil, then it should be relegated to the scrap heap. But before arriving at such a drastic conclusion I trust that the municipal surveyors throughout the country will further investigate the matter, as personally I should not like to occupy a house that had not been efficiently trapped and separated from the sewer. Many years ago I purchased in a provincial town a house that had a bad reputation as being insanitary. I ascertained that the drainage was good, but that there was no trap, and that the sewer with which the drain communicated was an old one of poor construction. I forthwith proceeded to relay the drain and inserted a "Buchan" trap, with a good cascade action, and provided a fresh-air inlet. I lived there for seven years with a young family, and none of them suffered from any zymotic disease, and since then, some twenty years ago, the house having changed hands, another young family has been reared with the same result. I should add that during the seven years, and, I believe, up to now, the drain has never choked or caused the slightest trouble of any kind. This may be only negative evidence, but it shows, I think, that where a house drain was formerly untrapped evil arose, whereas after trapping the house was rendered perfectly safe, although the sewer was an excessively bad one.

I cannot help thinking that the slur now thrown upon the trap must be due to improperly shaped traps, or, which is more frequent, careless fixing. We ought to be extremely grateful to the Departmental Committee of the Local Government Board for their labours and report, but we should, I think, be on our guard before coming to a too hasty conclusion. The condemnation of the intercepting trap is one of the most drastic alterations in our sanitary dogmas of belief that have occurred during the last few years.—Yours, &c.,

Pater Familias.

September 16, 1912.

FACILITIES FOR PROFESSIONAL EDUCATION.

To the Editor of The Surveyor.

Sir,—Your correspondent appears to have omitted the Northampton Institute, Clerkenwell, from his list of places in London where engineering classes are held.

This institute has excellent classes for A.M.I.C.E. and B.Sc. work, and a special feature is made of the practical testing work.—Yours, &c.,

J. Stuart King

Council Offices,
The Priory,
Friern Barnet, N.
September 13, 1913.

[The list referred to by the writer of the above appeared in last week's issue (p. 357).—Ed. The Surveyor.]

The name of the Garden Cities and Town Planning Association was, we find, inadvertently omitted from the letter of Mr. Ewart G. Culpin, the secretary of that body, which appeared in our issue of last week (p. 357).

Workmen's Insurance Contributions.—It is reported that the Local Government Board have intimated to the Malden and Coombe (Surrey) Urban District Council that the payment by the council of their workmen's weekly insurance contributions will not be allowed.

Power-saving Pulley Coverings.—We understand that the Power Saving Company are now pushing their business under new management, with marked success. We have recently had submitted to us an ingenious model of their non-slipping covering of compressed fibre, which covers the driving face of power pulleys, and which, where the driving power is sufficient and the belt capable of carrying the load demanded of it, restores the power lost by the slip, producing more work and less wear and tear. The material for this fibre covering is tenacious in wear, and has been used on fast, slow, heavy and light drives with equal success. It is easily fixed without the removal of the pulley from the shaft. There should be a wide field for an invention calculated to effect such conveniences and economies.

Law Notes.

Edited by J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

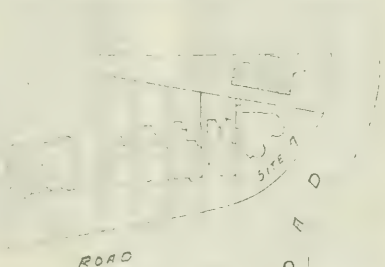
QUERIES AND REPLIES.

In order to avoid confusion queriists are requested to use distinctive words as noms de plume. *The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.*

Private Street Works: Encroachments on Highway: Laying Out a New Street.—"San-Remo" writes: Will you kindly help me by giving replies to the following, as my council have adopted the Private Street Works Act, 1892: (1) To what scale should the plans be drawn to be acceptable by the Local Government Board? (2) Ditto cross-sections? (3) Is it necessary to show each house (where they exist) on lands in full—*i.e.*, will a portion do, showing the width of the houses in front? My reasons for asking are that to measure up the flanks and back premises and plot them would be a big order in my case, as I have several streets in hand. (4) Page 20 (*c*) "Statutory Exemptions," J. B. Reignier Conder's work, appears to infer that all public places of worship are exempt from payment for making up the streets under the 1882 Act; if this is so, how are the lands or premises apportioned for payment? And would a public library or institute or school be included in this exemption; (5) I find, by taking rough measurements in some of the streets which I am about to make up, that the fences in some places have encroached on the road as much as 12 in. and 15 in. These have been laid out many years, and no deposited plans are available. Can I call upon these frontagers to set back (at their own cost) to give the width of 36 ft.? (6) "Specification Provisional Apportionment," &c., J. B. Reignier Conder: The explanation of the specification appears to me quite clear. (7) I understand I must prepare a bill of priced quantities to get at my total cost of the street, and apportion this equally to each frontager. The quantities, together with specification, may be inspected, &c., but am I right in assuming it is not necessary to show my prices to those of the frontagers who wish to inspect these plans, &c., or must my prices appear in the bill? (8) A person has a small field, and has notified his intention of shaping out a roadway through its centre from the county road to the extent of his land, and submits his plans showing the position of his land, with the roadway marked thereon, and adjoining owners' names, all properly drawn to scale, and in accordance with the by-laws (which are the Model Series of the Local Government Board), which require the total width to be 36 ft. The local authorities have returned his plan refusing their sanction on the grounds that he had not submitted levels, sections, &c., and marked his proposed building plots, &c., thereon. Now I contend he is not laying out a new street within the meaning of the by-laws, as he has no intention of building for the moment, and as to building plots, he is prepared to sell anything from 20-ft. frontage up to the whole length of the road in one piece or plot if a purchaser comes along; in other words, he is simply marking out the ground—*i.e.*, a 36-ft. roadway—on his own private property. I therefore contend he is not liable to submit plans with detailed sections, &c., until he commences to build (*vide* Sir George Jessel, late Master of the Rolls, Lord Selborne, and others).

(1), (2) and (3) The Local Government Board supply special forms on which plans and estimates are required in the case of street improvements, and these will no doubt contain all needful information and instructions on these points. (4) Under the Act of 1892 churches and chapels exempt from poor rate are not chargeable with private street works expenses, and their proportion is payable by the urban authority (see sec. 16 of the Act). This exemption does not extend to a public library, institute or school. If, however, any such building is devoted by law to a public purpose in such a way that it can never be let at a rack rent, it would be exempt on the *extra commercium* principle (see pp. 23-27 of the work referred to). Exempted premises abutting on the street must be included in the provisional apportionment. *Herne Bay Urban District Council* v. *Payne*, 1903, 2 K.B., 199). (5) If these are really encroachments—that is to say, if these owners have set forward their fences on land dedicated as part of the highway—they can be called upon to set the fences back at their own cost to the boundary of their land. (6) These particulars are taken from the Schedule to the Act. (7) The estimate must show "particulars of the probable cost," and this would appear to involve a statement of prices. (8) I agree. The planning out of the estate on paper does not amount to laying out the street. It will be sufficient if plans are submitted before the erection of the first house (see the remarks of Lord Esher in *Robinson* v. *Barton Eccles Local Board*, 21 Ch.D, at p. 750).

By-laws: Air Space.—"Q. E. D." writes: I should be glad to know whether the accompanying plan conforms with the by-laws relating to sites abutting on



two streets, a copy of which I forward. The site marked "A" is the one referred to.

[Copy of by-laws referred to.]

"Where two sides at least of the site of such building immediately adjoin streets he shall provide on one side other than the front of such building an open space which shall be free from any erection thereon above the level of the ground, except any portico, porch, step or other like projection from such building, or any gate, fence or wall not exceeding 7 ft. in height, and which shall extend laterally throughout the entire width or depth of such building, and across which the distance from every part of such building to the nearest boundary of any lands or premises immediately opposite, or to the opposite side of the street immediately adjoining such site, shall be not less, in any case, than 36 ft. He shall provide on another side, not being the front of such building, an open space which shall exclusively belong to such building which shall be free from any erection thereon above the level of the ground except a water-closet, earth-closet or privy, and an ashpit, which shall extend laterally throughout at least 10 ft. of the entire width or depth of such building, and across which the distance from every part of such building to the nearest boundary of any lands or premises immediately opposite, or to the nearest boundary of any street immediately adjoining such site, shall not be less, in any case, than 10 ft. at the least. A person who shall make any alteration in or addition to such building shall not by such alteration or addition diminish the aggregate extent of open space provided in pursuance of this by-law in connection with such building, or in any other respect fail to comply with any provision of this by-law. Where any open space may have been provided in pursuance of any by-law in that behalf in the rear of a domestic building, a person shall not by the erection of any building upon such open space or by any other means diminish the aggregate area of open space so provided."

In my opinion the by-laws are not applicable. Site A is triangular, and although the side adjoining the road is curved, it is one side only.

Lighting of Private Streets in Rural Districts.—"E. P. E." writes: The council of a rural district have recently made up and taken over the streets of an estate in one of their parishes under the Private Street Works Act, 1892 (powers being obtained from the Local Government Board). Other parts of the same parish are lighted by the parish council by special rates under the Lighting and Watching Acts, but, owing to the residents of the estate not being in a two-thirds majority in favour of lighting, the lamps fixed when the streets were made up, and the cost of which was included in the street charge, are not lighted. Some of the residents in one of the streets, however, wish to light several of the lamps, and to defray the expense by making a voluntary rate among themselves. Before doing so they would be glad to be enlightened on the following points: (1) Does the taking over of the streets by the rural district council include the lamps? (2) If not, in whom are the lamps

vested? (3) Whose permission is it necessary to obtain to enable some of the residents to light certain of the lamps themselves? (4) In the event of such residents obtaining permission, will they be liable for any possible damages for depreciation of property not lighted in the same or adjoining streets?

(1) If sec. 161 of the Public Health Act, 1875, has been declared to be in force in the district, by Order of the Local Government Board, the lamps would presumably vest in the rural district council under that section. (2) I gather that the Lighting and Watching Act, 1833, has not been adopted for the part of the parish in which these streets are situate. If such is the case, then, unless the lamps are vested in the district council, they would apparently be vested in the owners or owners of the soil of the street, subject to the rights of the public. (3) Assuming that the Act of 1833 has not been adopted, I think the consent of the council would be sufficient. (4) The residents are under no liability to light the streets, and I do not see how they can be liable for depreciation of property not lighted.

PAVING OF YARDS.—Mr. Samuel Rawson, CERT.SAN.I., inspector of nuisances, &c., of the borough of Hemel Hempsted, writes: In the issue of THE SURVEYOR of July 12th last I noticed a reply to a query of "A. M. O. K." respecting the paving of common yards, &c., stating that, in the absence of by-laws, a local authority have not power to compel owners to do the work. In my district there are very few unpaved yards, the work having been done in every case by the owners, under sec. 25 of the Public Health Acts Amendment Act, 1907, which, if adopted by a local authority, gives them power to do the work in default and recover the cost. This no doubt was overlooked when considering the above case. I enclose form of notice used in this district, which no doubt would be useful to your querist.

[FORM REFERRED TO.]

PUBLIC HEALTH ACTS AMENDMENT ACT, 1907.
(7 Edw. VII., c. 63.)

Notice to Drain Subsoil of Dwelling-house or Surface of Yard.

To _____

the owner of the dwelling-house situate at ....

Whereas the * yard in connection with, and exclusively belonging to the dwelling-house situate as above is not so formed, flagged, asphalted or paved provided with such works on, above, or below the surface of the yard, as to allow of the effectual drainage of the subsoil or surface of the yard by safe and suitable means to a proper outfall, WE, the ....

being the Local Authority under the Public Health Acts Amendment Act, 1907, for the district in which such dwelling-house is situated, do, in pursuance of section 25 of the said Act, by this notice require you, the owner of the said dwelling-house, within twenty-one days after the service hereof to execute and complete all the following works, namely:—

_____

_____

_____

as necessary for the effectual drainage of the subsoil or surface of the yard to a proper outfall.

Dated this _____ day of _____ 19

(Signed) _____

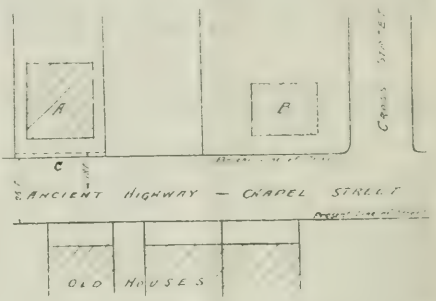
_____ of the said Local Authority.

(Address) _____

NOTE.—If within the said period of twenty one days the owner has failed to complete the execution of the works specified in the notice, the local authority may execute the work, and may recover from the owner in a summary manner as a civil debt the expenses incurred by the local authority in the execution of the works.

I must plead guilty to having overlooked the Act of 1907 in connection with this question. It is true that its provisions are only in force in those districts where they are applied by the Local Government Board, but where so it has been applied it undoubtedly gives the authority power to secure that the yards of dwelling-houses shall be "so formed, flagged, asphalted, or paved," or "provided with such works on, above, or below the surface" as to allow of effectual drainage. I am much obliged to Mr. Rawson for calling attention to this. The form of notice he kindly sends will no doubt be useful to "A. M. O. K." if the section is now, or becomes in the future, in force in his district.

LAYING OUT A NEW STREET.—[illegible] Surveyor of [illegible] Parish Council have prepared [illegible] approval, marked A on the accompanying sketch. The width of the highway at C is 28 ft. wide. Old houses are built along the opposite side, and one at [illegible] on the same line marked B, plans for which [illegible] passed by the council [illegible] years ago. The house B is the only one built on that side of the highway and [illegible] 300 yds. long. The council's by-laws made under sec. 157 of the Public Health Act, 1875, and dated May, 1883, state that—"Every person who shall lay out a new street which shall be intended for use as a carriageway shall so lay out such street that the width of the road shall be 36 ft. at the least." In *Pound* v. *Plumstead Board of Works*, and *Dryden* v. *Putney*, &c., it was decided that—"An ancient highway may become a new street within the meaning



of this section (see Lumley, Public Health Act, note (*b*). Am I right in contending—(*a*) That a new street is being laid out, and the street line at C be set back 18 ft. from the centre of the highway; (*b*) has the council any liability to pay for the land thus thrown into the highway; (c) will the street line set out when B was built govern in this instance?

(*a*) The cases referred to merely decide that an old highway *may* become a new street, but the mere building of a house on land adjoining a highway does not constitute the laying out of a new street within the meaning of by-laws. See *Rushcliffe* v. *Creer* (64 J. P. 200); *Devonport Corporation* v. *Tozer* (1903, 1 Ch. 759). In the absence of special circumstances, I do not think it would be held that a new street is being laid out in the present case. (*b*) Unless a new street is being laid out, the council would have to purchase any land required for widening the highway, under sec. 154 of the Public Health Act, 1875. (*c*) Under the Public Health (Buildings in Streets) Act, 1888, house A must be set back in a line with house B.

RURAL HOUSING.

THE PROBLEM IN ESSEX.

The demand which exists for a supply of better cottages for the accommodation of the working classes in Essex is referred to in the last issued annual report of the county medical officer of health, Dr. J. C. Thresh.

In the majority of parishes in the rural parts of the county systematic inspection has revealed the fact that many unsatisfactory cottages are occupied by families who are able and willing to pay more rent if they were able to obtain larger and more commodious dwellings, and that many cottages are occupied although barely fit for habitation, and are in such a condition that the owners would prefer to close rather than improve them to any extent. It appears that many of the existing and tenantable cottages are lacking in all conveniences, such as sinks, coppers, and sometimes even ovens.

In some cases, the report states, owners threaten to close cottages and eject the tenants if any undue pressure is put upon them to spend a considerable amount of money in making the places really habitable.

The difficulty of obtaining at a reasonable price land in a convenient position is commented on by Dr. Thresh. "The landowners," he says, "exhibit no anxiety to provide the land. If the authority selects a piece and approaches the owner it is unfortunate that the piece selected is so often the most valuable one in the whole parish. . . .There may be no actual opposition, but the apathy may be so absolute and the price so great as to be practically insuperable." It is added that if the land is obtained there is still the great difficulty of providing cottages which will let at anything like a remunerative rent. If sanitary authorities provide cottages, "they are expected to build and maintain them on a higher plane than any builder or private individual, and at the same time to get them at a lower rent than that charged by private owners for inferior cottages."

Workmen's Cottages. A correspondent is desirous of knowing the names of any medium size towns (say of between 15,000 and 20,000 inhabitants) where cottages for the working classes have been erected by the local authorities.

WATER SUPPLY IN ESSEX.

DECREASING YIELD FROM DEEP WELLS.

In a report on the water supply of the county Dr. J. C. Thresh, medical officer of Essex, states that the water level in the chalk and Thanet sands is falling, indicating that more water is being abstracted than is entering from the rainfall. He adds that as the number of deep wells is annually increasing and most of these are being drawn upon to the utmost, the water level and the yield of water from individual wells will continue to decrease. Dr. Thresh points out that if, as he surmises, sea water is entering, there is not only the danger of failure of supply, but also of the water ultimately becoming so saline as to be useless for drinking purposes.

Except from deep wells water is only obtainable in the county from superficial gravel beds, and, in Dr. Thresh's opinion, these sources should be protected as far as possible so that the springs from them may continue to be utilised.

At the present time many small communities are supplied from such springs. Clacton is entirely supplied with water from gravel beds, Colchester is partly supplied from springs at Lexden, Chelmsford also depends for more than half its supply upon gravel springs. The latter borough is seeking to increase its supply by sinking another deep well, and upon the site chosen is likely to obtain an additional 100,000 gallons of water per day. "Possibly," remarks Dr. Thresh, "much more than this could have been obtained on lower ground where the sands are not compressed by a thickness of London clay and of superficial deposits."

The report continues: "A successful bore has been made at Bocking for supplying one side of Braintree. A previous bore made on elevated ground was a failure, the water being very limited in amount. The second bore near the river yields far more water than is required. At Broomfield, near Chelmsford, a bore has been successfully completed, and a complete scheme for supplying the parish has been submitted to the Local Government Board. At Maldon an attempt has been made to increase the supply from one of the bored wells by boring further into the chalk. This was a failure. At Tolleshury the boring made for the supply of the town yield a water containing 80 grains of salt per gallon. When the chalk was pierced in the hope of getting a less saline water, the water level fell about 18 ft. This and the Maldon experience indicates that, in central and South-East Essex, it is worse than useless to continue borings into the chalk."

THE USE OF SALINE WATER.

As to the wholesomeness of the waters used for public supplies at Southend, Colchester, Witham, Chelmsford, and other places, Dr. Thresh says there appears to be no doubt, but near the coast in certain parts of Essex the only deep-well water obtainable contains 70 grains and upwards of common salt per gallon. So far these waters have only been used for supplying farms or a few cottages, and when such a water has been obtained in boring to obtain a public supply, it has been unhesitatingly condemned as being unsuitable for the purpose. "Fifty grains of salt to a gallon of water," observes the writer of the report, "imparts a saline taste perceptible to many people, and when the amount is increased to 70 grains everyone can detect it. The comparatively few people I have been able to interrogate acknowledge that at first they would not have used the water for drinking purposes if they could have obtained any other, but that they soon became accustomed to it and liked it, and have never experienced any ill-effect which could be attributed to its use."

Proceeding, Dr. Thresh says: "The subject has recently assumed greater importance since it is now proposed to utilise such a saline water as a supply for a population of several thousands. I have suggested mixing it with an equal volume of spring water or subsoil water, but unfortunately a sufficient quantity of a sufficiently good water does not appear to be available for the purpose. The water in question contains about 85 grains of salt per gallon, so that, assuming each person drinks 3 pints per diem, each would imbibe 31 grains of salt. Many wild and random statements are made about the injurious effects of salt, but no proof seems to be adduced that its continued use in moderate quantities has produced illness of any kind. In Essex thousands of people are entirely dependent upon supplies containing 55 grains of salt per gallon, and these localities are about the healthiest in the county. Will the additional 30 grains per gallon be deleterious? Or, in other words, if water containing 21 grains of salt in the 3 pints drunk daily is perfectly wholesome, is it likely that a water containing 31 grains will be unwholesome? My opinion is that the water is quite wholesome, and that after the inhabitants have become accustomed to its use no objection will be found to it."

In his concluding remarks on the subject, Dr. Thresh says it will be interesting in years to come to note whether these deep-well waters alter in character. "The present utility of the analyses lies in the fact that by consulting them an idea of the probable character of the water to be obtained from any deep boring in any part of the county can be ascertained, and very often this information determines the site at which a well should be sunk to obtain the best type of water available. I have hundreds of similar analyses of water from private wells, which have been recorded for the benefit of any authority or person in the county who may wish to know the character of the subterranean waters in any locality. The Government Geological Survey is preparing a report on the water supplies in Essex, and, as my assistance has been asked, no doubt the whole of these analyses will be included and form a valuable record for study and for reference."

"The Civic Engineer's Who's Who." The first issue of "The Civic Engineer's Who's Who" (London: St. Bride's Press, Limited, 24 Bride-lane, E.C., 2s. 6d. nett) gives wonderfully complete lists of the engineering officials of England and Wales. For a first issue it is very creditable.—*Glasgow Herald.*

New School at West Hartlepool.—A new municipal high school for girls was opened at West Hartlepool last week. The school, which is a handsome building in the Renaissance style, is situated in Eldon-grove. Accommodation is provided for 300 scholars, but further classrooms can conveniently be added at any time to bring the accommodation up to 400. The school includes a chemical and physical laboratory, cookery-room and art-room. The site occupied is 1½ acres, one-third of this being devoted to a playground. There are also a covered playground and a tennis court. The cost of the school, including the building, furnishing, &c., has been £11,826.

Assistants' and Students' Section.

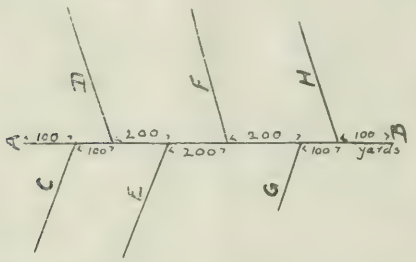
CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

272. Surface-Water Drainage.—State, showing the method of working out, the sizes of pipes necessary to take the surface water from streets as per sketch.



Streets are 36 ft. wide, and tar paved; all the houses are drained on the combined system, so that no surface water from the forecourts, &c., need be reckoned. Rainfall ½ in. per hour.

Street.	Length.	Fall.
A–B	1,000 yds.	1 in 40
C	200 ,,	1 in 20
D	300 ,,	1 in 10
E	200 ,,	1 in 20
F	500 ,,	1 in 30
G	100 ,,	1 in 15
H	150 ,,	1 in 50

(F. H. S., *Sheringham.*)

273. Cast-Iron Stanchion.—Calculate the size of a cast-iron stanchion 12 ft. in height alongside an external or party wall to carry a load of 54 tons. (T. R.)

274. Administration.—What is the best arrangement of the columns in a surveyor's cash-book (also wages-book), to show, in addition to the usual items, separate columns for the workmen's and the council's contributions under the National Insurance Act? ("R. D. C.")

275. Cantilever.—A cantilever of uniform cross-section and length L carries a concentrated load W at the free end. A prop is placed at a point $\frac{L}{4}$ from the free end, bringing this point to the same level as the fixed end. Find an expression for the reaction at the prop, and the deflection of the free end of the cantilever. Neglect the weight of the cantilever. (B.Sc.Eng. Final.) (H. F. W., *Tottenham.*)

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

REPLIES TO QUESTIONS.

267. Road Making.—Will some reader kindly give the heads of a specification for the conversion of a macadamised into a wood paved road? ("Inquirer.")

[In response to our suggestion last week that a further discussion of this subject would be interesting, we have received the following communication, which we gladly publish.—ED.]

Before proceeding to tabulate the heads asked for by "Inquirer" it may not be out of place to point out that the specificaton should be written in some convenient order so as to facilitate future reference to any particular item. For instance, when specifying actual work the heads should follow the same order in which the contract will be carried out. Working by this method, it will be seen that the heads can be arranged in various groups, when writing the draft, thus tending to obviate the omission of any item. The following heads may be taken as suitable for an ordinary wood-paving contract. In the grouping, when writing the draft, 1–9 would be classed as general clauses; 10–15 materials; 16–30 actual work.

HEADS

(With brief notes where considered desirable).

1. *General.*—Brief summary of work included in the contract.
2. *Protection of Work.*—Frost, &c.; make good damage.
3. *Traffic Arrangements.*—Foot traffic; hand-carts, &c.
4. *Payments.*
5. *Time of Completion.*
6. *Work Satisfactory to Surveyor.*
7. *Extras.*—How measured; pricing.
8. *Maintenance.*
9. *Provisional Sum.*
10. *Cement.*
11. *Sand.*
12. *Ballast.*—If the old macadam is to be re-used (see clause 17), particulars should be given under this head as to the amount of granite allowable in the concrete—*i.e.*, whether the whole of the aggregate be sifted macadam or a combination of macadam and ballast. Then the required proportions of sand and stone in all aggregate should be specified. The contractor is to provide sand to mix with the granite, and also a sufficient quantity of ballast to make up for any deficiency in the sifted macadam. State the estimated thickness of macadam on the roadway.
13. *Water.*
14. *Shingle.*
15. *Testing Materials.*—Samples.
16. *Setting out Work.*—Gradients to channels; camber of road; intersections.
17. *Breaking up Macadam.*—If macadam is required as aggregate for concrete, specify sifting, stating size of sieve mesh. Cart fine stuff.
18. *Removing existing Pavings.*—Those in channels, crossings, around manholes, &c. It is important to state how the materials are to be disposed of, giving full particulars relating to cartage of all materials found on the site and not required for re-use.
19. *Excavations.* Ground under macadam, and foundations to pavings. Surplus carted.
20. *Soft Ground.*—Old trenches, &c.; extra thickness of concrete. Surplus carted.
21. *Gulleys.*—Existing altered; new gulleys; accurate levels.
22. *Damage by Accumulated Water.* Soft ground treatment. (See 20.)
23. *Concrete Foundation.*—Composition of concrete; mixing; used fresh; thickness; consolidate.
24. *Floated Coat and Method of Laying.*—Composition; mixing; used fresh; thickness; laid to screeds—distance apart; after screeds removed make good.
25. *Wood Blocks.*—Description and quality of wood. If soft wood, state quantity of creosote per cubic foot. Size; uniformity; arrangements for selection of timber.
26. *Laying Blocks.*—Straight courses; break point; channels; joint; cutting to intersections, &c.; experienced men required.
27. *Expansion Joints.*—Width; cleaning out; material required for filling.
28. *Grouting.*—Composition; worked into joints; paving to be approved previously.
29. *Surface Grout.* Cement and sand; proportions; applied evenly.
30. *Dressing.* Shingle; gauge; periodical dressings.
31. *Road Open to Traffic.*—Open after —— clear days from date of completion.

(F. E. Y., *Richmond.*)

271. Bending Moments.—If a straight prismatic baulk of timber floats in a horizontal position with a weight of 4 cwt. hung to each end, what will be the bending moment at the centre of its length?

When a body floats in a liquid the resultant pressure of the surrounding liquid on the surface of the

body is equal to the weight of the displaced liquid, and acts vertically upwards in a line passing through its centre of gravity. It follows, therefore, that the weight of the displaced liquid must be equal to the weight of the body, and the centres of gravity of both must be on the same vertical line. It is also important to note that the pressure of a liquid at rest is the same at all points of the same horizontal plane.

The baulk of timber in question will therefore be supported by a total pressure acting vertically upwards, equal to the sum of the weight of the baulk itself and the loads at the ends. This pressure must act uniformly along the whole length of the baulk, because it lies horizontally in the liquid. (See Fig. 1.)

It is probable that the weights which hang at the ends of the baulk will have a greater density than the

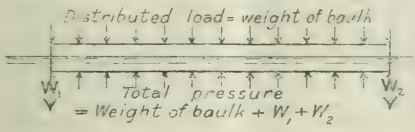


FIG. 1.

liquid in which they are immersed, in which case their effective weights will be less than their actual weights by the weight of their own volume of the liquid in which they hang.

Now, as the baulk is supported throughout its length by the liquid, there will be no bending moment due to its own weight, but only that due to the weights hung at its ends. The baulk may then be considered as a beam under an evenly distributed load of a total amount equal to the sum

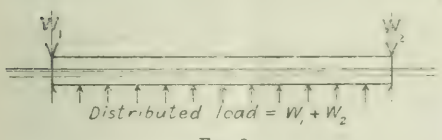

FIG. 2.

of the effective weights of the loads at the ends. (See Fig. 2.)

The formula for the bending moment at the centre of a beam with a distributed load and supported at the ends is—

$$BM = \frac{Wl}{8}$$

Where

BM = maximum bending moment,
W = total distributed load,
l = length of beam between supports.

In the absence of precise information as to the length of the baulk of timber, the density of the liquid, and the volume of the weights, it is not possible to give a specific value for the bending moment. (I. W. S., *Clapham Junction.*)

This is a simple case of a beam with an evenly distributed load, the upward pressure of the water on the baulk (*i.e.*, the force which keeps it afloat) being the distributed load, giving reactions of 4 cwt. each.

If we have a beam resting on supports at its ends, and with an evenly distributed load which makes the reactions at the supports 4 cwt. each, and imagine the whole turned upside down, then this is exactly similar conditions to the given floating baulk of timber.

Let L = length of baulk in feet.

We know that the bending moment at any section is the algebraic sum of the moments of all the forces acting on either side of that section.

Since the reactions are 4 cwt., or 448 lb. each, we know that the whole distributed load must be 896 lb., and the load on $\frac{1}{2}$L is 448 lb.

Now, taking moments about the centre of the baulk, we have—448 × $\frac{1}{2}$L = 224L ft.-lb. tending to turn the body in one direction, and half distributed load (448 lb.) acting at $\frac{1}{4}$L from the centre, or 448 lb. × $\frac{1}{4}$L = 112L ft.-lb. tending to turn body in opposite direction.

Then, subtracting the latter from the former, we get 224L − 112L = 112L ft.-lb., which is the bending moment at the centre of length of baulk. (P. H. W., *Harwich.*)

[The reply sent in by "P. H. W." deals with the question in the usual way, but it should be observed that "I. W. S." is quite correct in stating that, for absolute accuracy, the weights given should be reduced by the buoyancy of the liquid acting on them.—Ed.]

LONDON COUNTY COUNCIL SCHOOL OF BUILDING.

NEW DEVELOPMENTS IN BUILDING EDUCATION.

Four years ago a day technical school for boys was established at the London County Council School of Building, Brixton, having for its object the provision of a sound scientific and technical training for those preparing to enter the building trades and allied vocations, admission to the school being restricted to boys between thirteen and fifteen years of age. So great a success has been this department that the policy is to be extended in the forthcoming session, beginning on Monday next by the establishment of a senior day technical school to provide instruction for students whose age and previous education are above the age and standard of education required for admission to the day technical school for boys. This senior school will prepare students for professional work, and the instruction is arranged in the following sections: (1) General building; (2) architecture; (3) surveying; (4) structural engineering. The curriculum will include instruction in building construction, architectural drawing, architectural history, freehand and perspective, geometry, land surveying, reinforced concrete and structural engineering, mathematics, mechanics of building, chemistry and physics of building materials, and practical training in brickwork, masonry, carpentry and joinery, plumbing and sanitary engineering, painting and decorating. The course has been arranged to meet the requirements of three grades of students: (1) Those able to take the complete course (fee 3 guineas per term); (2) those able to take part-time instruction only (fee 1½ guineas per term); (3) those desiring to take up work in individual subjects (fee ½ guinea per term). The part-time course provides instruction on five half days per week from 3 to 5 p.m. in the following subjects: Quantity surveying, land surveying, mathematics, reinforced concrete and structural engineering, mechanics of building. The full course will extend over two years.

In the evening classes at the school several improvements will also be effected. The work of the school has been divided into five sections—namely: (1) Trade subjects; (2) building construction and allied subjects; (3) surveying; (4) structural engineering; (5) architecture and drawing. The third and fourth sections are newly created this year.

SANITARY ADMINISTRATION AT CHICHESTER.

LOCAL GOVERNMENT BOARD CRITICISM.

At a meeting of the Chichester Town Council last week a letter was received from the Local Government Board stating that the board had under consideration the report of their medical inspector, Dr. Hutchinson, after his recent visit to Chichester for the purpose of investigating the housing conditions of the city. The board regretted to find that the sanitary administration of the city could only be described as very unsatisfactory. Not only had the amount of inspection which had been undertaken under sec. 17 of the Housing and Town Planning Act, 1909, been very inadequate, but it would seem that the steps which had been taken by the town council to remedy the sanitary and other defects to which their attention had been drawn by their officers had in many cases been inadequate and indecisive. This position would in any case be extremely unsatisfactory, but it became more so when attention was drawn to the fact that not a few of the defects to which attention had been drawn and which remained unremedied or were partially remedied were in property belonging to a member of the town council. The board were fully alive to the fact that the above was a most serious reflection on the administration of the town council, but it was clear to them that strong measures would be necessary to alter the position unless the town council themselves made up their minds without delay to adopt entirely different methods of dealing with sanitary defects, and to support and encourage their officers in any attempts they might make to improve the sanitary conditions of property in the city.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Balderton P.C. (September 12th. Mr. T. C. Ekin).—£650 for the purpose of public street lighting for the village.—Mr. Holmes, the clerk, said the parish council had no loans, and the annual expenditure averaged 3d. in the £ from the rates. The parish council proposed to enter into an agreement with Messrs. Simpson & Co. to supply electric light for public street lighting at 1d. per unit. There was opposition from residents who thought gas lighting would be better than electric lighting.

Bentley (Yorks) U.D.C. (August 27th. Mr. A. G. Drury).—£12,225 for works of sewerage and sewage disposal at the new colliery village of Bentley.—Mr. Balfour, of Messrs. D. Balfour & Co., of Newcastle-on-Tyne, who explained the scheme, said it was proposed to provide additional main sewers and sewage disposal works for a large number of houses proposed to be built in the neighbourhood of the Toll Bar estate. About 200 houses were being built, and it was expected that a large number would be built in the near future. The works to be built would provide for a population of 2,000 in that immediate district alone. Mr. R. G. Whitley, surveyor to the council, also gave evidence.

Brynmawr U.D.C. (September 4th. Mr. M. K. North).—£1,100 for the purchase and alteration of Trafalgar House, Brynmawr, for the purposes of a parish room and public offices.—It was stated that Brynmawr was the largest urban district in Breconshire, but the only public offices in the town consisted of a room 16 ft. by 16 ft., which was used as the clerk's office and also for council meetings.

Coventry T.C. (September 13th. Mr. H. R. Hooper).—£2,292 for street improvements, and also for the purchase of land for the extension of St. Paul's cemetery.—The town clerk, Mr. George Sutton, said it was proposed to widen Swan-lane from 25 ft. to 45 ft., at a cost of £354. The sum required for the extension of the cemetery was £1,700.—It was estimated that the present cemetery would meet the requirements for four years. This, said the town clerk, was a very short period, because the population of Coventry had increased more rapidly than any other place in England during the last ten years. This increase was still going on, and there was in contemplation a further extension of the boundary. He asked for the longest period possible to be allowed for the repayment of the loans.

Guildford T.C. (September 3rd. Mr. Courtenay Clifton).—£3,440 for the purchase of 134 High-street, for the purposes of street improvement, and £750 for works of surface water drainage in Woking-road and Woodlands-road.—With respect to the application for surface-water drainage, it was stated that the Guildford Garden City Syndicate were developing an estate in the district. The borough surveyor, Mr. C. G. Mason, gave details of the proposed works.

Newark T.C. (September 10th. Mr. W. O. E. Meade-King).—£2,355 for the purchase of the Sconce Hills as a pleasure ground.—There was some opposition to the proposal, it being urged that the land was unsuitable for a pleasure ground and also that it was outside the borough boundary.

Newport (Mon.) T.C. (September 10th. Mr. A. G. Drury).—£3,900 for works in connection with the water supply in Beechwood Park, £2,685 for alterations and additions to Friars-street depot, £3,184 for public conveniences in Cardiff-road, Austin Friars, Pillgwenlly, and the provision market, and £325 for the improvement of a public convenience at the top of Dock-street.—The necessary particulars were supplied by Mr. H. Tremellen, borough engineer, and Mr. Tr barne Morgan, deputy town clerk.

Nottingham T.C. (September 10th. Mr. W. O. E. Meade-King).—£6,750 for the scheme to preserve the south bank of the Trent by constructing an embankment similar to the Victoria Embankment on the other side, £2,200 for the purchase of two motor fire engines, and £1,650 for improvement at Hockley.—It was explained that the bank and foreshore of the river Trent between Trent Bridge and the boundary of the parish of Wilford had been seriously damaged by floods during the past few years, and the council proposed to construct works of concrete piling, with six concrete steps, similar in character to the steps on the other side. Part of the bank was protected some time ago by works out of revenue, and it was proposed to increase the benefit of these works so as to have a uniform height of six steps. The total length to be dealt with was 440 lin. yds. The city engineer, Mr. A. Brown, described the plans. With respect to the Hockley improvement, the town clerk emphasised the importance of the thoroughfare, which led to the populous Sneinton and Carlton-road districts. The width at the present time, including causeways, was 28 ft., and the proposal was to make the street 60 ft. in width. The governors of the Nottingham High School had agreed to sell the land, which comprised 470 sq. yds., the purchase price being £2,820. As to the loan for motor fire engines, it was explained that the present plant consisted of one motor engine, five horse steam engines, and two manuals. Two of the horse-drawn engines were supplied in 1894 and 1895 respectively, and were worn out.

Strabane No. 2 R.D.C. (August 23rd. Mr. J. C. Hannigan).—£4,928 for the erection of twenty-eight cottages for labourers.—It was stated that the council had already built 350 cottages for labourers, and the total amount of the loans granted for this purpose was £64,200, of which £3,200 was unexpended, which amount would be sufficient to build seventeen or eighteen cottages. It was estimated that the total expenditure in connection with each cottage, including the cost of land and legal expenses, would be £176. There was only one unoccupied cottage in the entire district, and the council did not intend to build any houses in the vicinity of that building. The nett annual responsibility of the council in connection with the cottages amounted to £1,277. The rents paid by the labourers weekly amounted to 1s. 3d. and 1s. 8d. for ½ acre and 1 acre plots respectively, and the total receipts were £1,331.

Stretford U.D.C. (September 12th. Mr. F. H. Tulloch).—£12,120 for the purposes of Edge-lane widening improvement (£6,000), street repairing (£6,120), and Longford Park and path (£2,980).—The clerk, Mr. George H. Abrahams, explained that, so far as Edge-lane was concerned, it was intended to widen the road 18 yds. from the city boundary to Lime-grove, but to proceed with different lengths only as opportunity arose. A portion of the land to be acquired included a belt of trees, and means had been devised to retain those trees by what was termed a "cage walk." That walk would be elevated owing to the level of the park land being higher than the adjacent road, and it would form one of the attractive features of the scheme. A sum of £2,980 was proposed to be expended upon the purchase of seats and the erection of public conveniences in the park, and the completion of the Seymour-grove footpath.

Tiverton R.D.C. (September 4th. Mr. R. G. Hetherington).—£1,000 for augmenting the water supply of Silverton.—It was stated that two schemes were prepared by Mr. Montague Luke (Messrs. Montague Luke & Partners, civil engineers, Plymouth), who was engaged by the council. One had to be dropped on account of difficulties connected with water rights, and the council had to fall back upon the present scheme, and a resolution was passed to borrow £700. But as a result of the drought of last year, when nearly every spring was affected, the engineer had to revise his plans and estimate. The revision provided for an increased supply of 30,800 gallons, and for sustaining the supply in times of drought. The cost of the actual work would be about £720, but the sum required would probably be between £950 and £1,000. It was proposed to spread repayment over thirty years. A penny rate would produce £37.

APPLICATIONS FOR LOANS.

Bexhill T.C. £360 for a sub-station at Little Common.

Cannock U.D.C. £10,442 for sewerage and sewage disposal works.

Carnarvon T.C. £2,000 for the purposes of a cemetery.

Desborough R.D.C. £2,150 for a sewage disposal scheme.

Newport (Mon.) T.C.—£5,400 for tramway offices and stores, and £830 for a car paint shop.

Scarborough T.C.—£1,040 for a bathing shelter.

Shoreditch B.C.—£2,546 for street improvement purposes.

South Stoneham R.D.C. £5,180 for sewering the Bitterne Manor estate.

Whitehaven T.C.—£3,337 for a workmen's dwellings scheme.

Yarmouth T.C.—£7,507 for the electricity undertaking.

LOANS SANCTIONED.

Bexhill T.C.—£607 for works of paving.

Carlisle T.C.—£3,500 for road improvement works.

Cheam R.D.C.—£650 for making up a road.

Cheltenham T.C.—£3,900 for paving works.

Coleraine R.D.C.—£680 for labourers' cottages.

Epsom R.D.C.—£1,432 for the purchase of land at the Cheam outfall works, and £1,300 for road widening.

Esher and the Dittons U.D.C.—£600, repayable within five years, towards the cost of repairing Imber Park-road. The money will be borrowed from a local lodge of Oddfellows at 3½ per cent. interest.

Godalming T.C.—£5,000 for repaving and sewerage works.

Hackney B.C.—£1,415 for a new road.

Harrington U.D.C.—£7,900 for the purpose of the Harrington Gas Order, 1912.

Heywood T.C.—£2,594 for carbonising plant for the gasworks, £1,500 for meters, and £600 for mains.

Newton Abbot R.D.C.—£600 for water supply purposes.

Radcliffe U.D.C.—£1,340 for road widening purposes.

Richmond T.C.—£6,300, Kew-road wood-paving (foundations), twenty years for repayment; £7 100, Kew-road wood-paving (wood blocks), ten years for repayment.

Scarborough T.C.—£551 for foundations and tarmacadam works, and £120 for a new sewer.

Sherborne U.D.C.—£1,085 for workmen's dwellings.

Tralee U.D.C.—£2 000 for a technical school.

Walsall T.C.—£9,000 for the electricity undertaking.

THE INTERCEPTING TRAP.

GRIMSBY BOROUGH ENGINEER'S RECOMMENDATION.

Following upon the report of the Departmental Committee of the Local Government Board on the subject of the intercepting trap in house drains, the subjoined report has been presented to the Sanitary Committee of the Grimsby Corporation by Mr. H. Gilbert Whyatt, ASSOC.M.INST.C.E., M.R.SAN.I., the borough engineer of that town:—

"The use of the intercepting trap on house drainage commenced about the year 1877, and from that time its use has been compulsory in the districts which have adopted the Model By-laws of the Local Government Board. A minority of municipal engineers and medical officers, however, have been opposed to its use, and in certain districts, although compulsory under the by-laws, its use has not been enforced.

"In October, 1908, the Local Government Board instituted an inquiry into its use, which included the carrying out of a lengthy series of experiments, both from an engineering and bacteriological point of view, and the examination of fifty-two witnesses, including medical officers of health, municipal engineers and surveyors, and architects and engineers in private practice.

"The result of this inquiry has just been published, and for the future the Local Government Board will not refuse to approve of by-laws where the use of the intercepting trap is not made compulsory.

"Personally, I have always been in favour of the intercepting trap, and finding it required by the by-laws now in force in this town, I have insisted upon the by-law being carried out; but in view of the report of the Local Government Board, while not deviating from my opinion, I recommend that, in the case of owners and builders who have any real objection to it, its use should not be insisted upon in the future.

"I shall be glad to have the instruction of the committee on the matter."

The matter, we understand, has been referred to a sub-committee to consider and report.

THE PROPOSED WESTERN APPROACH ROAD TO LONDON.

According to the preliminary plans and estimates prepared by the engineers (Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., for the London County Council portion of the road, and Mr. H. T. Wakelam, M.INST.C.E., for the Middlesex County Council), the cost of the works proposed to be carried out by and under the supervision of the respective County Councils of London and Middlesex will amount to about £1,750,000, of which sum the Road Board have promised one-half. The expenditures in the county of London are estimated at about £1,000,000, and in the county of Middlesex at about £750,000.

The route of the proposed new road commences at Kensington, and passes through Hammersmith, Chiswick, Brentford, Isleworth, Heston and Hounslow, terminating at the west of the last-named town by a junction with the main Bath road. A connection with the main Staines and Windsor road at a future date is also contemplated.

A Well-earned Holiday.—Mr. Albert Toft, road surveyor to the Bakewell Rural District Council, who is sixty years of age, has just been granted a month's holiday—the first he has had, he says, in his life. Mr. Toft asked for a holiday because his health was failing.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bishop Auckland, Blackpool £11,000, Blyth £10,000, Hamilton £13,000, Paddington, St. Helens; housing and town planning—Evesham £10,000, Greenock; roads and materials—Newhaven, North Tipperary; water, gas and electricity—Batley £20,000. Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Ayr T.C.—The question of building a diphtheria block at the hospital, at an estimated cost of £2,700, is under consideration.

Belfast T.C.—The tender of Messrs. J. & W. Stewart, at £1,097, has been accepted for extensions to the offices of the waterworks department.

Bishop Auckland U.D.C.—The surveyor, Mr. T. Collins, has received instructions to prepare plans for a public swimming bath, with an annexe for Russian and Turkish baths.

Blackpool T.C.—The public swimming baths are shortly to be enlarged, at an estimated cost of £11,000.

Blyth U.D.C.—A scheme is in progress for the erection of a town hall. The estimated cost is £10,000.

Bolsover U.D.C.—The surveyor, Mr. W. Browne, in a statement to the council, shows that the cost of the new offices was £1,285.

Bristol T.C.—The tender of Messrs. J. Perkins & Sons, Limited, at £267, has been accepted for the erection of an engineers' messroom at Avonbank electricity station.

Dumbarton T.C.—Alterations at the public slaughter-house are to be carried out at an estimated cost of £1,300.

Hamilton T.C.—New municipal offices are to be erected in Cadzow-street at an estimated cost of £13,000. The new building will contain all the town's offices under one roof, with the exception of the police office. The site adjoins the present Public Library, and is, in fact, a continuation of the same scheme.

Hereford C.C.—A secondary school for boys, a description of which will be given in a future issue, was opened recently.

Kirkcaldy T.C.—The generating station is to be enlarged, at an estimated cost of £2,196, and Messrs. Smith & Son, of Kirkcaldy, have obtained the contract for the masonry work at £1,432.

Maldens and Coombe U.D.C.—From eight tenders for the extension of the mortuary, that of the Strand Building Company has been accepted at £94. The estimate of the surveyor, Mr. R. H. Jeffes, was £90.

Mallow R.D.C.—An improvement (buildings) scheme, estimated to cost £42,250, is being promoted by the council, who have referred the plans to the Local Government Board.

Paddington B.C.—The council are to consider a proposal by the Baths Committee that public baths should be erected on a site adjoining the Harrow-road.

St. Helens T.C.—The question of the provision of additional public baths has been referred to the Baths Sub-Committee.

Sheffield T.C.—The Markets Committee have approved a scheme for the rearrangement of the Sheaf Market and provision of extra stalls consequent on the site of the Pheasant Inn and other buildings being thrown into the market, the carrying out of which involves a supplementary grant of £910 (the total estimated cost of the work being £1,280). It is estimated that after the alterations have been carried out this market will yield an additional income of £1,053.

Thornaby-on-Tees T.C.—The borough engineer, Mr. C. T. Johnson, has been authorised to lay out the Pottery site for depot purposes.

Torquay T.C.—The architect has been instructed to prepare a report, with plan and estimate of the cost of providing and furnishing a reading-room at the pavilion.

Wellington T.C.—The advisability of purchasing the Assembly Rooms for public purposes has been the subject of investigation, and the matter has been adjourned for further consideration.

Wood Green U.D.C.—It has been decided to purchase for £3,000 a fifth of an acre (including some slum property) as a site for a fire station.

HOUSING AND TOWN PLANNING.

Blaydon-on-Tyne U.D.C.—It has been decided to erect twenty workmen's dwellings at Chopwell.

Evesham U.D.C.—Recently the council decided to build sixty cottages at Broadway under the Housing of the Working Classes Act, and the Local Government Board sanctioned the borrowing of £10,000. The Public Works Loan Board subsequently wrote declining to advance the loan until it was shown the scheme would be self-supporting. The clerk forwarded a copy of the balance-sheet of the scheme to the board, and asked them to reconsider the matter. At a meeting of the Evesham Council on Monday it was announced that the Public Works Loan Board now consented to advance the loan at 3½ per cent.

Greenock T.C.—It has been agreed to erect 200 workmen's houses under the Town Planning Act. The first tenement will be proceeded with at once in the east end of the town, and the remaining tenements will probably be built in the middle area.

Halstead (Essex) R.D.C.—A committee has been appointed to consider the question of providing working-class dwellings.

Holywell R.D.C.—The Housing Committee have instructed the inspector to report as to the need for new houses in the district, and as to dilapidated houses which might be purchased by the council and repaired, so as to be fit for habitation.

Hungerford R.D.C.—The tender of Mr. G. Elms, of Stockcross, at £880, has been accepted for the erection of six workmen's dwellings.

Morpeth T.C.—The tender of Mr. G. Douglas, of Newcastle-upon-Tyne, at £5,855, has been accepted for the erection of thirty-three workmen's dwellings.

Skibbereen U.D.C.—The sanction of the Local Government Board has been received to a scheme for the provision of seventeen labourers' dwellings.

Whitehaven T.C.—It has been agreed to purchase a plot of land for building sites. The cost is £1,525, or £251 per acre.

PARKS AND OPEN SPACES.

Brixham U.D.C.—A sum of £300 is to be spent on laying out a recreation ground.

Edinburgh T.C.—Works to cost in the aggregate £2 165 are to be carried out at Calton Hill and its approaches.

Irlam U.D.C.—It is proposed to provide a public recreation ground at an estimated cost of £4,147.

Oswaldtwistle U.D.C.—The question of providing a bowling green at an estimated cost of £400 is being considered.

Southport T.C.—New municipal golf links, which have been laid out at a cost of £1,250, were opened last week.

REFUSE COLLECTION AND DISPOSAL.

Colwyn Bay U.D.C.—With reference to the destructor which, as reported in last week's issue, is about to be erected for this town, the cost of burning, as estimated by the surveyor, Mr. Wm. Jones, ASSOC.M.INST.C.E., is 7·8d., and not ¾d. per ton, as stated. Mr. Jones thinks this may be considered a very favourable figure, although he is hopeful that in the actual working of the destructor he will be able to reduce the cost to about 6d. per ton by means of the revenue which he expects to make in the use of some quantity of the hard clinker for mortar, and road and footpath foundations, and from the sale of old tins and so forth.

Margate T.C.—The report of the inspector shows that out of 1,315 premises inspected, 195 were still without proper receptacles for the removal of house refuse. The necesary notices have been served on the owners.

Swansea T.C.—The Health Committee have opened an exhaustive investigation into a system of street

cleaning and scavenging, and the general administration of the stables department.

ROADS AND MATERIALS.

Bagshot U.D.C.—The surveyor, Mr. O. G. Stanley, has prepared plans for the widening of part of Guildford-road.

Broadstairs U.D.C.—The tender of Messrs. H. W. Cooper, Limited, of Mark-lane, London, at £264, has been accepted for the execution of road works.

Cheltenham T.C.—The Acme Wood Flooring Company have secured the contract for paving the Promenade from Clarence-street to Imperial-square, at a cost of £3,900.

Chester-le-Street R.D.C.—The tender of Messrs. Thompson & Son, at £4,597, has been accepted for making up the roads to the new bridge to span the Wear.

Chichester T.C.—It has been agreed to make up the portion of the Brighton to Portsmouth road in the city with the council's staff.

Dorking U.D.C.—The tender of Mr. H. M. Baker, at £675, has been accepted for the improvement of London-road.

Isle of Wight R.D.C.—A tender for the carting of about 2,050 tons of quartzite has been accepted at 11d. per ton. A committee of the council rejected this price on the ground that the work could not be carried out at the price, and accepted a tender for 1s. 9d. per ton. This, however, the council refused to adopt, and, as has been stated, reinstated the tender for 11d.

Lowestoft T.C.—The council have approved the estimate of the borough surveyor, Mr. G. H. Hamby, for making up and sewering Waveney-drive, at £1,272, £301 of which is payable by the freeholder.

Luton R.D.C.—Improvements are to be carried out in Cumberland-road at a cost of £230.

Maesteg U.D.C.—A tender of £629 has been accepted for the construction of a new road.

Maldens and Coombe U.D.C.—The council have approved the plans of the surveyor, Mr. R. H. Jeffes, for improvements at Coombe-lane, to cost £190.

Newhaven R.D.C.—This council, together with the Eastbourne Rural District Council, is submitting a joint scheme for the improvement of the Newhaven to Eastbourne road to the Roads and Bridges Committee of the East Sussex County Council.

North Tipperary C.C.—The council have adopted the suggestion of the county surveyor that stone-crushing plant should be purchased at a cost of £2,000. In the judgment of the county surveyor this machinery will effect a saving of £7,000 a year in the rates.

Paisley T.C.—The improvement of the south entrance to the Gilmour-street Station is contemplated by opening up the archway under the railway incline and forming a thoroughfare to Moss-street, or, alternatively, by alterations in the station, with the consent of the railway company.

Poole R.D.C.—The dangerous part of the roadway leading down from Corfe Mullen into Broadstone is to be widened at a cost of £81, including £25 for land. Complaint was made by councillors that the widening would not be sufficient, but it was officially intimated that no more land could be obtained.

Walsall T.C.—The borough surveyor, Mr. John Taylor, has prepared a report on the desirability of constructing a new approach to the town from the Birmingham-road.

Weymouth T.C.—The borough surveyor, Mr. K. J. S. Harris, has prepared plans for wood paving and concreting works estimated to cost £5,640, which have received approval.

Worsborough U.D.C.—The tender of Messrs. Porter & Sons, at £1,443, has been accepted for works of road widening.

SEWERAGE AND SEWAGE DISPOSAL.

Aspatria U.D.C.—The tenders of Messrs. Middleton & Hopper, at £5,107, and Messrs. Arundel at £2,543, have been accepted for sewerage and outfall works.

Itchen U.D.C.—The scheme for the drainage of Sholing has been submitted to the Local Government Board by the engineer, Mr. H. J. Weston, and has been duly approved.

WATER, GAS, AND ELECTRICITY.

Batley T.C.—A proposal is being discussed for the extension of the electricity works, at a cost of about £20,000.

Cosford R.D.C.—Water supply works are to be carried out at a cost of £353.

Edinburgh T.C.—The surplus on the year's working of the electricity undertaking was £2,179.

Ilkeston T.C.—The tender of Messrs. Thomas Bayle & Sons, Limited, of Stourport, has been accepted for the erection of a new gasholder.

Middleton T.C.—An additional steam dynamo is to be installed at the electricity works, subject to the consent of the Local Government Board to a loan to meet the cost.

Mossley T.C.—The question of erecting a new gasometer at an estimated cost of £3,000 is under consideration.

Sedgley (Staffs) U.D.C.—A nett profit of £1,599 was realised on the gas undertaking last year. A scheme is in preparation for extending the gasworks.

Spalding R.D.C.—With respect to the water purchase question, the Local Government Board have provisionally agreed to the purchase of the bore at Pinchbeck West by the council, and for 6 miles of piping, but not for the 2 miles of piping in Whaplode. The purchase price is £2,500 for the bore and the whole of the piping up to the Holbeach boundary. The matter has been left in the hands of the clerk.

Wombwell U.D.C.—The gasworks are to be extended at an estimated cost of £7,000.

MISCELLANEOUS.

Carnarvon T.C.—For cemetery purposes an offer has been made to the council of upwards of 4 acres of land for the sum of £800, and it has been decided to complete the purchase and spend in addition £1,200 upon the drainage and laying out of the ground, subject to the consent of the Local Government Board.

Farnham U.D.C.—At a recent meeting it was decided to invite tenders for granite, coal, and forage, and Mr. Aldridge raised the question as to British or foreign granite. The chairman suggested that the tenders should be limited to the owners of British quarries. Mr. Kempson said he would second such a motion. Mr. Mitchell: Won't the county surveyor have something to say about it? Mr. Aldridge: He agreed to British granite last year. Mr. Mardon objected to such a proposition being sprung upon the council without notice. After discussion, the chairman withdrew his motion, but hoped that the committee might afterwards see their way to give due weight to the tenders submitted on behalf of British quarries. Mr. Mardon: I shall always vote for the best article.

Hove T.C.—It was stated at the council meeting last week that the estimated cost to the town of the proceedings in Parliament for promoting and opposing Bills for railless traction would be nearly £6,000.

Paisley T.C.—A new motor fire engine, by the Halley Industrial Motors, Limited, has been added to the fire brigade equipment, at a cost of £1,030.

Sheffield T.C.—Tramway track reconstruction and doubling is to be expedited by continuing the work during the winter, under precautions which will safeguard its efficiency. The work will involve an outlay of £10,000, and a similar amount is to be spent on doubling a considerable section of the Fulwood route.

York T.C.—The Board of Trade have confirmed the order made by the Light Railway Commissioners authorising the extension of the tramways.

New County Buildings at Dumfries.—At Dumfries on Wednesday the foundation-stone of the new county buildings was laid by the Marquess of Tullibardine, M.P.

Blackpool Promenade Scheme.—Blackpool Town Council on Wednesday considered a further scheme for extending the promenade at South Shore to the junction of the St. Annes District at Squire's-gate, a distance of over 2,000 yds. A feature of the project is the provision of a grass plot, 30 ft. wide the whole distance for pedestrians on one side, and a tramway track and carriageway on the other. The borough surveyor, Mr. J. S. Brodie, estimated the total cost at £48,000.

PERSONAL.

Mr. D. Munro, burgh surveyor of Nairn, has resigned.

Mr. J. Robinson, surveyor to the Darlington Rural District Council, has had his salary increased by £50 a year.

Mr. O. G. Stanley, surveyor to the Bagshot Urban District Council, has had his salary increased by £30 per annum.

Mr. O. Frewin, surveyor to the Crowmarsh Rural District Council, has been appointed surveyor to the Newbury Rural District Council.

Mr. G. R. Percy, assistant in the borough surveyor's office, Windsor, has been appointed assistant surveyor to the Ilkley Urban District Council.

Mr. R. Williams, surveyor to the Soke of Peterborough County Council, has sent in his resignation, to take effect at the end of the year.

Mr. J. Skelton Smith, surveyor for the Kintyre District of Argyll County Council, has had his salary increased from £200 to £250 per annum.

Mr. W. Butler, surveyor to the Fareham Urban District Council, has been voted £20 for his services in connection with the extension of the town's water mains.

Mr. R. H. Blake, formerly assistant surveyor to the Esher and the Dittons Urban District Council under the present surveyor, Mr. H. C. Fread, has been appointed to the post of assistant surveyor to the Brazilian Government, at a salary of £1,200 a year.

Mr. P. J. Kelly, assistant surveyor for the Londonderry No. 2 District, has been appointed county surveyor for the Southern Division of Donegal County, in the place of Mr. J. Steadman, who has been transferred to the Northern Division, at a salary of £550, with £50 a year for office and clerk.

Mr. E. F. Spurrell, borough surveyor of Holborn, Worshipful Master of the Randagh Lodge, No. 834, is interested in the cases of the boys of Brothers Oaker and Katzupes, and informs us that he will be very grateful if any of the brethren in his profession can send him proxies for the election in October. Any votes that brothers have for girls can be made available by exchange.

The late Mr. T. Longdin, borough surveyor of Warrington, whose sudden death was recorded in The Surveyor of September 6th, was buried on the 7th inst. at Hill Cliffe. Civic honours were paid to deceased by the presence of the Mayor of Warrington, many members of the corporation, a full muster of the members of the borough surveyor's staff, and representatives of public bodies. Mr. Longdin, the *Warrington Guardian* writes, "commanded the high respect of all associated with the public life of the town, not alone for his brilliant accomplishments, but for his strict integrity, and secured the affections of his workpeople by his kindly manner and consideration."

FOR OTHER ADVERTISEMENTS

See End of Paper.

CITY OF MANCHESTER.

The Rivers Committee require the Services of a competent Clerk of Works immediately on the Main Drainage Works; salary £3 3s. per week. Applicants must be prepared to work night duty if required. Applications, stating full particulars as to experience, &c., accompanied by copies of three recent testimonials, to be addressed to the Chairman of the Rivers Committee not later than 10 a.m. on Saturday, the 28th inst.

Canvassing, directly or indirectly, will disqualify

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester.

ASSISTANT (22), three years Articles and Assistant in large Rural District, desires appointment as Assistant to Municipal Engineer; surveyor, leveller, neat draughtsman; sewage disposal, water supply, private street, buildings, roads, good municipal experience, &c.; highest references. "Decclaratum," office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

URBAN DISTRICT COUNCIL OF KIRKBY-IN-ASHFIELD, NOTTS.

The above-named Council invite Tenders from responsible Contractors for Sewerage and Extensions to the Sewage Disposal Works.

The works comprise about 4,378 yds. of 15-in., 12-in., and 9-in. diameter Iron and Stoneware Outfall Sewers, &c., together with Manholes and other appurtenant Works, and taking up and relaying certain Sewers, also alterations and extensions at the Outfall Works, including Bacterial Filters, Circular Tanks, and sundry alterations to existing Works, also erection of small Engine-house and 554 yds. of 4-in. Pumping Main, &c.

Plans and Specifications can be seen at the Offices of the Engineers, Messrs. Elliott & Brown, A.MM.INST.C.E., Burton Buildings, Parliament-street, Nottingham, and copies of the Bills of Quantities and Form of Tender may be obtained after September 24th on deposit of Three Guineas (by cheque), which will be returned on receipt of a *bonâ-fide* Tender, not afterwards withdrawn, and the return of all documents lent to the Contractor for the purpose of making up his Tender within fourteen days of the notice informing him a Tender has been accepted.

Sealed Tenders, endorsed "Tender for Kirkby Sewerage Works," to be delivered to the undersigned not later than the first post on Tuesday, the 15th day of October, 1912.

The lowest or any Tender will not necessarily be accepted.

The Engineers will notify applicants of a date when the Plans may be inspected at Kirkby and the site of Works pointed out.

(By order)
E. BERTRAM HIBBERT,
Solicitor and Clerk to the Council.

Public Offices,
Kirkby-in-Ashfield.
September, 1912.

TO ROAD CONTRACTORS AND TAR-PAVIORS.

HIGH-STREET, TWICKENHAM-ROAD AND MANOR-ROAD IMPROVEMENTS.

The Urban District Council of Teddington are desirous of receiving Tenders for the following Works in connection with the Making Up and Improvement of the above—*viz.*:—

134 super. yds. Roadway Formation.
364 lin. yds. 12-in. by 8-in. Norwegian Granite Kerb.
58 lin. yds. Granite Channel and Laying.
580 super. yds. 2½-in. Artificial Stone Paving.
134 super. yds. Tar Paving and Laying.

Plans and Specifications may be seen, Bills of Quantities and Forms of Tender obtained (on payment of £2 2s., which will be returned on receipt of a *bonâ-fide* Tender), on application to Mr. M. Hainsworth, Surveyor, Council Offices, Teddington.

Sealed Tenders, endorsed "Road Works," must be delivered to me, the undersigned, at the Council Offices, Teddington, not later than noon on Saturday, the 5th day of October, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
G. H. SALMONS,
Clerk.

Council Offices,
Teddington.
September 16, 1912.

METROPOLITAN BOROUGH OF SHOREDITCH.

APPOINTMENT OF DRAUGHTSMAN.

The Shoreditch Borough Council invite applications for the appointment of a Draughtsman in the Borough Surveyor's Department, at a commencing salary of £100 per annum, rising by annual increments of £10 to a maximum of £140 per annum. Age between 21 and 30 years.

Applications, on Forms to be supplied, accompanied by copies of not more than two recent testimonials, must reach the undersigned on or before noon on Wednesday, 2nd October, 1912, endorsed "Draughtsman."

Personal canvassing will be a disqualification.

J. A. D. MILNE,
Town Clerk.

Shoreditch Town Hall,
Old-street, E.C.

Royal Sanitary Institute Congress at York.

ENGINEERING AND ARCHITECTURE SECTION.

(Conclusion.)

Among the papers submitted for consideration in the Engineering and Architecture Section of the recent congress of the Royal Sanitary Institute at York was one by Dr. Tempest Anderson dealing with the development of that city.

THE DEVELOPMENT OF YORK.

At the time of the enclosure of York said the reader of the paper, the city's great opportunity in the matter of town planning was lost. In his opinion it would have been quite easy to have retained a "town belt" round the walls, as has been done in most towns in New Zealand. It was even proposed to keep a broad road outside the walls over the site of the present station from outside Micklegate Bar to Marygate, where a bridge was to have been built. This would have allowed the stage coaches from London to the North to have gained the North road in Bootham without entering the city, and would have obviated the necessity of pulling down the beautiful old Ouse Bridge. The proposal never had a fair chance, but was defeated by the opposition of the innkeepers inside the town. About the beginning of the last century the necessity of providing for the through traffic from North to South through the city began to be apparent, and, after prolonged wrangling, an Act of Parliament was obtained for a broad street, extending from Fishergate on the South, through the centre of the city to Bootham Bar on the North road. Parts of this were actually made—viz., Parliament-street and St. Leonard's-place—but before the rest of the street was made the party representing Coney-street interests got into power, and all the works were stopped. Parliament-street became merely a market place, and St. Leonard's-place an ordinary street, so that all the money was wasted, and no through street obtained.

"An attempt," continued Dr. Anderson, "was made a few years ago to complete part of the scheme south of Parliament-street, though not on the original scale, and the most expensive part of the work, a bridge over the Foss, has been executed, but the connecting link to Fishergate yet hangs fire, and will be very expensive, though in the first instance it could have been comparatively cheaply done when the land was worthless swamp. Even when this is completed the link from Parliament-street to St. Leonard's is still wanting, while more money has been spent uselessly in widening Davygate piecemeal than would have made the straight street originally, while untold sums have been spent in widening corners in Coney-street, Nessgate, and making Clifford-street, all of which might have been saved if the original Parliament-street scheme had been carried through.

"This policy of piecemeal widening has been going on all my life. Whenever I have asked any corporation, 'When are you going to take the suburbs in hand?' the answer has always been, 'We have to spend more than we can afford to improve the old city. The suburbs must be left to private enterprise.' The result has been that all the suburbs have grown up as slums without any plan, only short streets of the narrowest width allowed by the by-laws have been built, and houses with every dimension the smallest allowed have been run up. A few years ago new by-laws were obtained, which were, I believe, on the Board of Trade models. I do not believe they even stipulate for any minimum cubic space in the rooms of houses, but they prescribe a minimum width for streets, and that for proposed long streets is greater than that for short. The result has been what might have been expected: no long streets have been built, but only a network of short ones. The new suburbs of Leeman-road and South Bank are in many respects worse than the older ones, such as the Grove."

In the course of further remarks, Dr. Anderson said he had given much thought to the best plan for the development of the York suburbs. During his student's life in London he became familiar with the Bloomsbury squares, which are built on the rectangular plan; and on his first tour abroad in 1869 he was much struck with the construction of Carlsruhe, which is built with streets radiating like the spokes of a wheel, with others connecting them in a circular direction. Both areas had evidently been built brand new on a predetermined plan, but either plan in its entirety was obviously impracticable to be applied to an old straggling city like York. At present there are a great number of roads radiating from York, some of which no doubt required improving, or even supplementing, but the great necessity was for improved communications in a circular direction. A vehicle at Acomb, for instance, requiring to go to Dringhouses must come round by York, a distance of 2 or 3 miles, though less than ½ mile of new road would enable a direct course to be taken at a considerable saving of distance, and almost the same applied to the want of a new road from Heworth, and the Malton-road, say, near Elmfield, to the North-road at Clifton, connecting with the roads to Huntington, Haxby, Wigginton and Rawclift on the way. Any new scheme of town planning for York must therefore include, at any rate, one circular road at the outskirts of the area at present built upon, and keep in view the probabilities of another, further out, in view of further developments.

Concluding, Dr. Anderson said: "The present Corporation of York includes among its members and officials several level-headed and capable men who are fully alive to the necessity of making provision for the future, but it has been explained to me that they cannot go in advance of public opinion, as they are expected to carry out the wishes of their constituents, and are exposed to much criticism, as well as powerful influences, and that anything that can be done outside in the way of educating public opinion will be helpful to them. It is in hopes of this assisting them, and not in any hostile or hypercritical spirit, that I have ventured to bring forward this paper with a view to enlist your sympathy and co-operation. In a matter of this importance, affecting as it does the prosperity of the city, not merely now, but for generations to come, it is essential that the very best plan should be obtained, and for the reasons stated above it is almost impossible that it can be evolved by local councillors or officials; besides which, we ought to have the benefit of the experience of those who have already planned other places abroad, and perhaps at home. If, therefore, the corporation decide to invite competition for plans, and raise a fund for prizes, I am quite ready to subscribe £100 to give it a start. I can only hope that this may lead to the fulfilment of the prophecy by some old Yorkshire witch, whose name I forget (perhaps Mother Shipton): 'Lincoln was, London is, and York shall be: the finest city of the three.'"

DISCUSSION OF DR. ANDERSON'S PAPER.

Mr. F. W. Spurr, city engineer of York, said in regard to town planning in York, some progress was being made in a serious attempt to develop the outskirts of the city on town planning lines. As they would realise, the process it was necessary to be gone through in order to satisfy the Local Government Board was not all that could be desired so far as speed was concerned. But at the same time a very large area in the outskirts of the city was being dealt with, and was now almost complete. With regard to the new street, it would not stop immediately over the Foss Bridge. The whole of the property was being acquired, so that it would link up with Piccadilly, and at the last meeting of the city council the street was called Merchantgate. It was a fact that the greatest inconvenience they had was to get across from one suburb to another, and any scheme taken up in York must have regard for this important necessity. What York was short of was a direct communication between the Fulford-road and the Dringhouses-road, but until they could undertake the planning of the city actually it was very difficult to say what would be the best thing to be done.

Miss G. A. Lowe (Warrington) asked, with reference to the erection of small houses at Hepworth, if they were not going to build them there, where were the people who inhabited those houses to be put? Was it not wiser to arrange some scheme by which the artisan class could have a sort of a model village? She knew it was the general view for most towns to cater for the better classes, but it seemed to her such

a pity that they did not at the same time cater for the lower classes.

Dr. Tempest Anderson, replying, said that question had not been overlooked in York. Mr. Rowntree, of Rowntree's Trust, of which he himself was a trustee, had spent £20,000 in providing for that in arranging the model village. The Holgate Land Company bought a large piece of ground, which they laid out, as they thought, on reasonable lines for the very purpose of providing a small commodious house and broad streets, with good access to them. The first difficulty was the question of sewage; that absorbed a large portion of their capital. Then they were told that they were building the streets a good deal too wide, and a councillor of the corporation who was on the committee, said: "Who is going to pay for those trees and grass margins? Do you propose to endow them, because it will require another man to do this?" They said they thought that if they could buy the land and make roads that might be sufficient. So that instead of encouragement from certain people they got nothing; they were considered visionaries. The result was, they had to borrow money from the insurance company. The dwelling sites did not go off so well as was anticipated, because 1,000 workers were taken from the railway works and sent to Darlington about that time. The interest on their loans increased so much that the insurance company foreclosed their mortgage, and the whole concern was therefore taken over by them. Finally, he was left with one or two small plots, and, sure enough, he had a notice from the Chancellor of the Exchequer intimating an extra tax for undeveloped land. Their experience, therefore, in providing better accommodation without cost to the ratepayers had certainly not been a success. This subject of the planning of York was so important that he would be glad if the corporation offered a prize, or a series of prizes, for the best plan, which should include that ring he had spoken of and the other matters, and he would be happy to contribute £100 towards such a desirable end.

Dr. Armstrong (Newcastle-on-Tyne) said he thought slum property should be dealt with on the lines adopted by the Liverpool Corporation and provide for the very worst of slum dwellers.

Mr. J. S. Brodie (borough engineer of Blackpool) said that in his town they had dealt with the street question in a different way. They saw the owners of the land, and said that if the owners bore the cost of the street up to the width required by the by-laws the corporation would pay the cost of making it the extra width. They recently widened a street and put in sewers, and by the sale of the surplus land were able to recoup themselves for the whole cost.

THE LONDON AND BRIGHTON ROAD.

PROPOSED RELIEF THOROUGHFARE AT CROYDON.

The Roads Improvement Association are making special efforts to secure the adoption, by the Corporation of Croydon, of a scheme for the construction of a new road between Thornton Heath and Purley, in order to relieve High-street, Croydon, of the through traffic which at present so seriously obstructs and congests that thoroughfare.

As a result of the activities of the association and its East Surrey centre, the Corporation Roads Committee and the borough surveyor have been authorised to prepare a comprehensive and detailed scheme and open up negotiations with the bodies and persons concerned. This has been done, and a detailed scheme is to be submitted to the corporation on Monday next.

Briefly, the scheme will entail an expenditure of £67,763. The Road Board have promised a grant of £30,000, and grant promised from other sources account to £5,700, the net cost to the corporation will, therefore, be £32,063. It is estimated that the annual charge for the sinking fund and interest to meet this sum will be approximately £1,600 and the annual cost of the maintenance of the road and footpaths about £1,100.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

SOME RECENT PUBLICATIONS.*

Modern Road Construction. By Francis Wood, M.Inst.C.E., F.G.S., Borough Surveyor of Fulham, with twenty-five illustrations and a coloured map. Price 4s. 6d. nett. London: Charles Griffin & Co.

Even if we include the sub-title, "A Practical Treatise for the Use of Engineers, Students, Members of Local Authorities, &c.," neither the aim nor the scope of this useful volume is disclosed by the title, and it is therefore desirable that the ground which it covers should be indicated at the outset of a review. It is primarily a study of road crusts from the point of view of the municipal engineer, attention being paid more especially to the part played by tar and bituminous materials in road and street work, but the relative costs of different kinds of paving are carefully considered. The part dealing with the nature and properties of bituminous materials will be of value to road engineers generally, and this section of the book, taken together with the references to water-bound crusts, constitutes a study of considerable importance. Appendix I. contains specifications for the making of streets, and Appendix II. consists of Road Board Specifications 1 to 6. Appendix III. is a two-page table recording the results of traffic enumeration in Fulham.

The volume has, however, a broader aspect, for it includes, not as a separate study, but embodied in different parts, the author's conception of what a road crust is, and clearly expressed opinions which will frequently challenge the attention of county and district engineers. The book is very far from being a treatise on road construction generally, and the word "modern" in the title ought to have been rather "recent developments in," and "road construction" replaced by "the construction of road crusts and of streets." It would not have been easy, within the compass of 133 octavo pages, to have dealt more fully with rural roads, or with road making, without trenching upon the space so usefully employed in giving the results of the author's experience, and his opinions, in his own field.

Dealing now with the subject-matter of the book, it must be pointed out that the introductory chapter must not be taken as indicating the qualities of the book, the general level of which is far above that of this somewhat scrappy chapter, which includes incomplete or wrong statements, such as those relating to ruling gradients and to Indian roads. A ruling gradient of 1 in 22 cannot be approached in many very large areas, and it could, in hilly countries, never be worth while to make secondary and by roads with such a ruling gradient. As regards Indian roads, it is not the fact that the military authorities make these roads throughout India; Mr. Wood has in part confused the past with the present, and has failed to mark the difference between conditions in India generally and those in such parts of that empire as the North-West frontier. Again, in comparing asphalt with macadam, Mr. Wood suggests that asphalt might "be more advantageous than macadam" on steep gradients, "as an asphaltic surface is generally dry and free from mud." In another paragraph, on the opposite page, he has himself suggested that 1 in 60 should be the limiting grade for asphalt, noting that 1 in 40 is not unusual. Another paragraph, which is not quite fair to county engineers particularly, is that dealing with tractive effect on surfaces (p. 5). In many counties and districts surveyors have made broken-stone roads of which it cannot be said that "wet" involves "muddy." The extent to which rural surveyors have succeeded in meeting the wet conditions in some of our rainy counties in the West and North-West is not appreciated in the dry areas and in the towns. As regards the set of the wheels of vehicles, it is to be feared that it is not practicable to fit the wheel to the road, the camber of which, with greater economy in the long run, properly varies according to the circumstances. If, however, Mr. Wood means that wheels with very wide tyres might, in some cases, be fitted with devices which would allow of a little side play, restrained by stiff springs, he will probably be supported by other engineers. With respect to camber (belt of a sloping footway to it that the barrel shape generally accepted, having regard especially to the importance of making main roads safe and convenient for cyclists. Indeed, in the next chapter, the straight slope from the middle third is definitely recommended for roads with gradients steeper than 1 in 100.

In Chapter II. "Macadam Roads" are discussed,

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

and though several of the passages are deserving of praise, it is clear that Mr. Wood's heart is not in this short chapter of nine pages, in which a description of the "present-day macadam road" is given in eight lines, without any suggestion that there is any other way of making a macadam crust, or that a depth of more than 6 in. is often necessary or desirable. Tresaguet and Telford have ten lines between them, and a "modification of Telford foundation" eleven lines. The remarks on dust powder and moisture are, however, well worth attention. As regards abrasion tests, it is impossible to agree with the contention that if stones are firmly held by a suitable matrix all kinds wear alike, nor can it be gathered from Mr. Wood's further remarks that the rigid road specially appeals to him, for in Chapter IV. he suggests that the air enclosed in the voids of a road crust plays an important part. Chapter III., on the "Wear of Roads," extends to only six pages, but is very good matter. It may be suggested that, as regards pressures, sufficient consideration is not given to the distribution of pressure on the subsoil.

The chapter on tarred roads (fourteen pages) includes well-considered treatment of most of the leading points, and should be of much value to students. It is not clear, however, what is intended by the sentence "the writer is of the opinion that tar should only be used where it can be removed from the effects of atmospheric conditions."

In the three following chapters Mr. Wood describes "bitumen" and "methods of using tar and bitumen" in a very capable manner, and there follows a short, but useful, chapter on "rollers and rolling." As regards total compression and the percentage of voids, the view taken by the author probably conforms with ordinary practice; but some engineers would like to see tar-macadam crusts rolled tighter than is usually the case. Excellent use is made of the remaining thirteen pages, which are devoted to "paving" and "cost of maintenance," and the volume concludes with the appendixes already referred to. The book contains twenty-five illustrations, all closely related to and explanatory of the text, and altogether the volume, though it consists of only 133 pages, is equivalent to a much larger book of the kind in which liberal use is made of unimportant illustrations, or of compilation beyond the useful limit. The outside matter included in Mr. Wood's book is all of an authoritative nature, and necessary to the purpose, and the author's frank and lucid observations on matters of prime importance make it a work to be reckoned with.

One mis-print has been noticed, two letters having been trans-posed in the name "Tresaguet."

Preliminary Studies in Bridge Design. By Reginald Ryves, Assoc.M.Inst.C.E., M.S.A., F.R.Met.Soc., M.Cons.E. Price 2s. nett. London: 8t. Bride's Press, Limited.

In these days of computation and the revival of apparently drowned volumes by means of artificial respiration in puffs, it is refreshing to come across a book which is not only written by its author from end to end, but is illustrated by diagrams and sketches specially prepared for the purpose by the same hand. The author begins by recognising five primary types of river crossings, including the type in which the water is given a maximum speed, exemplified further on in the book by diagrams showing his design for a canal "drop" as fully developed, so as to provide a road crossing on an earthen embankment. The principle is one which has been followed in the case of small aqueducts, especially when designed under the influence of Moorish tradition, but Mr. Ryves is apparently the first engineer to apply it to canals or streams of considerable size. The nature of the attack which a stream makes upon a bridge is then studied with the aid of a classification of streams and rivers into three types, without distinction of size, and the problems which arise in the case of a "wandering stream" are carefully considered.

Throughout the book the conception of a bridge as a crossing of the road by the river is never lost sight of, and in considering any particular kind of bridge the author is evidently on the look out for indications that would suggest the economic advantages of a bridge belonging to some other of his five types. Indian experience clearly inspires his treatment of crossings of shallow rivers, but familiarity with the kind of watercourse that is "big enough to be a trout stream" keeps English conditions always in sight. The behaviour of a small stream is, fortunately for the student, very much like the behaviour of a great river—scale for scale. To the regular readers of The Surveyor it may be suggested that the volume form of the articles of which the book is a reprint is worth a place in the bookcase, while the student who begins the study of bridge design with a perusal of this little volume will be beginning at the proper place, with preliminary studies.

Mr. Raymond Unwin, F.R.I.B.A., architect of Letchworth Garden City and Hampstead Garden Suburb, is the author of a highly interesting booklet entitled "Nothing Gained by Overcrowding." Coming, as it does, from one of the leading authorities on the subject in Britain, the case against overcrowding, as presented by Mr. Unwin, is brought home by some striking facts and arguments. He has worked out with minute care and analysis what happens in the development of an estate under the ordinary or by-law method, and the result that is brought about by town planning, which limits the number of houses per acre. He makes it beyond question that the advantages are all on the side of the town planner and the investor. The pamphlet is exceedingly well illustrated by a striking number of charts and diagrams, as well as by photos illustrating the actual difference in houses and ground space which exists between the ordinary and the garden suburb. It is published by the Garden Cities and Town Planning Association, of 3 Gray's Inn-place, W.C., and the price is 3d.

Vol. vii. of the "Transactions" of the Edinburgh Architectural Association, which has just been issued, is a record of the various lectures and addresses delivered before and of places visited by the members of that body in the years 1908 and 1909. A list of members is included in the book.

"Enquire Within upon Poultry and Egg Production" is the title of a useful booklet which Mr. Ralph R. Allen, of Sawbridgeworth, the author, will forward to all interested free on receipt of postcard.

INSTALMENT PAYMENTS FOR ROAD CONSTRUCTION.

SYSTEM CONDEMNED BY DISTRICT AUDITOR

Some time ago the Holborn Borough Council entered into a contract with the Improved Wood Paving Company for the paving of Shaftesbury-avenue, and for the provision of a new concrete foundation, the payments therefor to be spread over a period of fifteen years, and to cover "first cost, interest, repairs, and renewals when necessary." According to the annual report of the council, just issued, the district auditor has condemned this arrangement as "certainly open to legal objection, for it is equivalent to spreading the cost of the new work done in the first year—that is, the major part of the whole work—over a period of years without sanction. The circumstances under which the expenditure was incurred appear to add weight to this objection. The estimates of the year did not include new work. . . ."

We refer to the matter in the present issue in "Minutes of Proceedings."

The Road Board Grants.—The clerk of the East and West Molesey Urban District Council at a recent meeting of that body read a letter from the Reigate Town Council with regard to the manner in which the Road Board had treated local authorities in the county as to grants under the Development and Road Improvements Funds Act. The town council were of opinion that the Road Board was not giving full effect to the intentions of Parliament, as, when the board was constituted, it was clearly laid down that a large portion of the grants made to it should be appropriated for road surface improvements for road widenings, the removal of objectionable corners, and so forth. It was manifest that these conditions were not being complied with, and not a little dissatisfaction had arisen owing to the manner in which applications were met by the Road Board. The Reigate Council asked to be acquainted with the council's views on this important question. The Highways Committee, who had considered the letter, recommended the council to pass a resolution in full sympathy with the action of the Reigate Town Council, and to instruct the clerk to forward a copy of the resolution to the town clerk. The recommendation was unanimously agreed to.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

COUNCIL MEETING.

At a meeting of the council, held at the offices of the institution on Saturday, the 7th inst., there were present: Messrs. R. J. Thomas (president, in the chair), W. N. Blair, T. W. A. Hayward, G. A. Phillips, G. F. Carter, W. H. Prescott, J. W. Cockrill, W. T. Lancashire, W. L. Redfern, O. E. Winter, A. E. Collins, A. H. Campbell, H. P. Maybury, W. Stubbs, J. S. Brodie, Thos. Cole (secretary) and H. A. Giles (assistant secretary).

The Constitution Committee reported the election of Mr. A. H. Campbell as chairman, and recommended that a letter be addressed to the hon. district secretaries of the institution reminding them that the time is now ripe for arranging the programme of the winter's work, and asking them to report to the council as to their proposals. An application from the hon. secretary of the South-Eastern District for the use of the offices for a meeting was granted.

The Housing and Town Planning Committee reported the election of Mr. J. W. Cockrill as chairman. A report from Mr. J. S. Brodie was read and ordered to be sent to the committee. Mr. Cockrill gave notice that at the next council he would move that a Town Planning Conference be held in connection with the next annual meeting, and that steps be taken with a view to obtaining the sanction of the Local Government Board to the payment of the expenses of delegates.

The Roads Committee reported the election of Mr. H. T. Wakelam as chairman. Messrs. J. Willmot and the presidents of the English, Scottish and Irish County Surveyors' Societies (for the time being) were co-opted to the committee. On the recommendation of the committee the council resolved to contribute a sum of 100 guineas to the International Roads Congress, 1913.

The Standardisation Committee reported the election of Mr. E. J. Elford as chairman. Messrs. E. B. B. Newton and F. W. Pearce were co-opted to the committee. A specification respecting street lighting was reported upon, and the secretary was instructed to send a copy to each member of the council. The secretary reported that the first edition of the Concrete Flag Specification was exhausted, and the committee were requested to consider certain amendments received from the Concrete Institute.

The Parliamentary Committee reported the election of Mr. A. D. Greatorex as Chairman.

The General Purposes Committee reported the election of Mr. J. Patten Barber as chairman. Messrs. Barber, Blair, J. S. Brodie, Greatorex, Harpur, Newton, Prescott and Winter were appointed further to consider the draft arbitration clause.

The Tramways Committee reported the election of Mr. W. Harpur as chairman, and Mr. A. E. Collins was co-opted to the committee.

The scheme of working of the Mutual Defence Fund was referred to the Constitution Committee. Messrs. Barber, Carter, Hayward, Maybury, Prescott, Scorgie, Wakelam and Winter were elected to the New Offices Committee.

The acting examiners for the October examination were appointed.

The council learnt with regret of the deaths of Messrs. T. Longdin and P. J. Lynam.

Mr. Hayward was elected as delegate to the Plumbers' Registration Council.

Mr. Scorgie was elected as a delegate to the N.A.L.G.O. General Purposes Committee.

An application for legal advice was referred to the president and secretary.

The Finance Committee reported the election of Mr. T. W. A. Hayward as chairman.

Elected as Members: Messrs. A. F. Churchill, first assistant to Director of Public Works, Hong Kong; R. E. Wilson, engineer and surveyor to the Knaresborough Urban District Council; E. D. Groves, surveyor and waterworks engineer, St. Austell; G. M. Seels, assistant engineer and surveyor, New Malden, Surrey; H. V. Snook, surveyor and inspector, Petersfield Rural District Council; G. C. Mitchell, assistant borough engineer, Stockton-on-Tees; J. E. Wilkes, town planning engineer to the burgh of Dunfermline; and T. H. Maxwell, surveyor to the Fylde Rural District Council, Kirkham.

Elected as Associate Members: Messrs. B. C. Hammond, senior surveying assistant, road surveyor's department, Worcestershire, and L. A. Cooper, first assistant, Chiswick Urban District Council.

Elected as Students: Messrs. J. W. Hill, city surveyor's office, Wakefield; H. Cliffe, surveyor's assistant, Mexborough; G. Kershaw, surveyor's office, Stretford Urban District Council; and R. W. Taylor, Town Hall, Gosport.

(By order of the Council)

Thomas Cole,
Secretary.

EASTERN DISTRICT MEETING AT GRAYS.

District Chairman—Mr. A. Fidler, M.Inst.C.E., Northampton.

An Eastern District meeting of the Institution of Municipal and County Engineers is to be held at the council offices, High-street, Grays, to-morrow (Saturday).

Programme.

11 a.m.—Meet at the council offices, High-street. Members will be received by Mr. H. E. Brooks, J.P., chairman of the urban district council.

11.15 a.m.—Formation of District Executive Committee. Paper, entitled "Municipal Works of Grays," by Mr. A. C. James, Assoc.M.Inst.C.E., surveyor to the urban district council (member).

11.30 a.m.—Discussion.

11.45 a.m.—Drive to the "Beach" Recreation Ground and open-air swimming pond, new infant school and school baths, Bridge-road, and thence to the Wouldham Cement Works.

1 p.m.—Light refreshments, by kind invitation of the Wouldham Cement Company.

1.30 p.m.—Inspection of the cement works.

3.30 p.m.—Proceed to the works of Messrs. Siegwart, Limited, to inspect the manufacture and testing of their reinforced concrete pipes.

Tea kindly provided by Messrs. Siegwart, Limited.

E. J. Elford,
Hon. District Secretary,
Southend-on-Sea. Borough Surveyor.

EAST MIDLAND DISTRICT MEETING AT ILKESTON.

District Chairman—Mr. E. G. Mawbey, M.Inst.C.E., Leicester.

An East Midland District meeting will be held at the Town Hall, Ilkeston, on Saturday, September 28th.

Programme.

10.45 a.m.—Reception by the mayor, Councillor S. Shaw, J.P., at the town hall.

11 a.m.—Special cars to Hallam Fields for Stanton Ironworks.

11.30 a.m.—Visit Stanton Ironworks.

1 p.m.—Lunch (kindly provided by the company) at the Stanton Ironworks Company's Hotel.

1.45 to 2.30 p.m.—Formation of District Executive Committee. Discussion on papers (which will be taken as read): "Ilkeston Sewage Disposal Works," by Mr. H. P. Raikes, engineer; "Twenty-eight Years' Municipal Work at Ilkeston," by Mr. H. J. Kilford, borough surveyor; "Ilkeston Tramways and Electricity Supply," by Mr. H. P. Stokes, borough electrical engineer.

3 to 4 p.m.—Inspection of the new sewage disposal works. The party will be conducted over the works by the engineer, Mr. H. P. Raikes.

4.10 p.m.—Special cars to the town hall, where tea will be provided.

Should time permit, a visit will be paid to the car sheds, police station, free library, cemetery chapels, lodges, gasworks, &c.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Saturday, September 21st, when a copy of the papers will be sent in due course.

R. A. MacBeath, M.Inst.C.E.,
Hon. District Secretary,
Lincoln. City Engineer.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. STICKLAND, ASSOC.M.INST.C.E., Borough Surveyor, Windsor.
President-Elect—Mr. FRANK LATHAM, M.INST.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

NORTH-WESTERN DISTRICT.

A meeting of this district will be held at the Victoria Hotel, Manchester, on Wednesday, the 25th inst., at 7.30 p.m.

BUSINESS.

(1) To consider the extension of the area of this district.
(2) To fix date, &c., of proposed social.
(3) To discuss Mr. Bleazard's paper on "Municipal Progress in Clitheroe."
(4) General discussion to be opened by Mr. Foster (Salford).

J. W. CLEAVE.
"Brantwood," *Hon. District Secretary.*
Coomassie-street,
Heywood.
September 12, 1912.

ANNUAL GENERAL MEETING.

The fourth annual general meeting of the Institution of Municipal Engineers will be held in London on Friday and Saturday, October 11th and 12th next.

PROGRAMME.

Friday, October 11th.

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.
11.15 a.m.—Annual general meeting:—
Minutes of last meeting.
Election of council for the year 1912-13.
Presentation of annual report of council.
Announcement of result of ballot.
Presidential address.
1 p.m.—Adjourn for lunch.
2 p.m.—Reassemble in council chamber.
2.15 p.m.—Discussion on the following papers to be presented to the meeting:—
"The Modernising of Building By-laws," by F. W. Platt (member).
"The L.G.B. Report on Intercepting Traps," by H. C. H. Shenton (member).
"The Influence of Town Planning upon the Public Health," by W. Louis Carr (member).
"Superannuation and Security of Tenure," by A. Winter Gray (Member).

(The papers will be taken as read, and advance copies may be obtained on application to the secretary, and will be forwarded as soon as the papers are in print.)

5 p.m.—Close of meeting. Ladies return to council chamber.

LADIES' MEETING.

(Held concurrently with General Meeting.)

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.
11.15 a.m.—Leave council chamber and proceed to the stores of Messrs. Selfridge & Co., Oxford-street, W.
11.30 a.m.—Meet at the Duke-street entrance of the stores, where visitors will be met by a representative of the firm and conducted round the building.
1 p.m.—Lunch.
2.30 p.m.—Meet at the showrooms of Messrs. Doulton & Co., Limited, Lambeth, S.E., who have kindly arranged to conduct the visitors through their works and showrooms.
4.30 p.m.—Leave Messrs. Doulton's works.
5 p.m.—Arrive at council chamber, Southampton-row.
6.45 p.m.—Reception by the president at the Holborn Restaurant, followed by (7 p.m. to 11.30 p.m.) social evening, with musical programme, at the invitation of the president. Morning dress.

Saturday, October 12th.

10.30 a.m. Visit to Shakespeare's England, Earl's Court. Meet in booking hall, Earl's Court Station.
12.30 p.m.—Adjourn for lunch.
2.30 p.m.—Visit to the London Hippodrome.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

INSTITUTION OF WATER ENGINEERS.

VISIT TO SOUTH WALES.

To-morrow (Saturday), by invitation of Mr. C. H. Priestley, M.INST.C.E., engineer for the works, a visit will be paid by the members of the Institution of Water Engineers to the Llwyn-on reservoir, in course of construction for the Corporation of Cardiff.

PROGRAMME.

9.15 a.m.—Train leaves Cardiff (Rhymney Station) for Merthyr.
10.40 a.m.—Brakes leave Merthyr for Cefn-Coed, whence the party will be conveyed by the contractors' light railway to the Llwyn-on reservoir works, passing the Sychpant limestone quarry *en route*.
11.30 a.m.—Arrive at the works, which will be inspected under the personal guidance of Mr. C. H. Priestley and his staff. The drawings will be arranged for inspection at the office. A paper, descriptive of the reservoir, by Mr. Priestley, will be circulated among those taking part in the visit.
1.15 p.m.—Luncheon served in the mission hall.
2.15 p.m.—Brakes leave the works for the Cantreff reservoir (opened 1892) and for the Beacons reservoir (opened 1897), whence the drive will be continued to the top of the gathering ground, returning to Merthyr *viâ* the Cefn-Coed balancing reservoir, which will be inspected *en route*.
4.30 p.m.—Train leaves Merthyr for Cardiff, arriving at Rhymney Station 5.40 p.m.
6.8 p.m.—Train leaves Cardiff (G.W. Ry. Station), arrives Cheltenham 8.16 p.m., Birmingham 9.50 p.m.
6.43 p.m.—Train leaves Cardiff (G.W. Ry. Station), arrives Paddington 9.35 p.m.
7 p.m.—Train leaves Cardiff (G.W. Ry. Station), *viâ* Hereford, arrives Birmingham 10.20 p.m.

Arrangements have been made with the manager of the Park Hotel, Cardiff, to accommodate members and visitors on special terms: Bed, breakfast and attendance, 7s. 6d.; bed, breakfast, dinner and attendance, 10s. 6d. A smoking and conversation room will be reserved this evening for the use of those taking part in the visit.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE, WEST HAM.

The annual conference of the Municipal Tramways Association (Incorporated) will be held in West Ham on September 25th, 26th and 27th next. De Keyser's Hotel, Victoria Embankment, E.C., has been selected as headquarters for delegates, and the following programme has been arranged:—

September 25th.

10.15 a.m.—Reception by the Mayor and West Ham Council.
10.30 a.m.—Presidential address by Mr. H. E. Blain, tramways manager, West Ham.
Paper: "Tramways Administration by Municipalities: A Retrospect and a Forecast," by Mr. Councillor S. C. T. Neumann, deputy-chairman Bradford Tramways Committee.
1 p.m.—Luncheon.
2 p.m.—Proceed to Tramways Depot, Greengate-street, Plaistow, by special cars.
2.15 p.m.—Discussion on the interim report of the Corrugation Committee.
3.30 p.m.—Inspection of depot and of the Exhibition of Tramway Appliances, &c.
7.30 p.m.—Corporation reception at the town hall.

September 26th.

10 a.m.—Paper: "Tramway Fares and their Basis," by Mr. W. J. McCombe, tramways manager, Hull.
12.15 p.m.—Luncheon.
1.15 p.m.—Proceed by special cars to tramway depot.
1.30 p.m.—Meeting of managers' section.
1.30 to 3 p.m.—Inspection of depot and Exhibition of Tramway Appliances.
3 to 5 p.m.—Garden party in West Ham Park.
7 for 7.30 p.m.—Association dinner at the Liverpool-street Hotel, E.C.

September 27th.

9.45 a.m.—Annual business meeting at De Keyser's Hotel.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. JOHN D WATSON, M.INST.C.E., F.R.S.I.

YORKSHIRE DISTRICT MEETING.

By kind permission of Councillor W. G. England, J.P., chairman of the Sewage Works Committee, the members of the above association will visit and inspect the Barnsley sewage works to-morrow (Saturday).

Objects of Interest.—Screening chamber, suction-gas-pumping plant, sedimentation tanks, percolating filters, 100-ft. and 120-ft. diameter distributors, and syphon sewer.

PROGRAMME

2.30 p.m.—Reception in the town hall by his Worship the Mayor, Councillor J. H. Cotterill, J.P., and the chairman and members of the Works Committee.

p.m.—Proceed to the works, which are situated about 2 miles from the town. Conveyances will be provided.

3.20 p.m.—Descriptive paper will be given by Mr. J. Henry Taylor, ASSOC.M.INST.C.E., borough engineer and surveyor, who will also conduct the visitors over the works, assisted by the manager, Mr. Chas. M. King.

5 p.m.—Tea, by kind invitation of the chairman, Councillor W. G. England, J.P., at the Imperial Hotel.

The works have been recently reconstructed, and are well worth a visit.

ROBERT TYSON,
Hon. District Secretary.

Queensbury Sewage Works,
Amblethorn,
Nr. Halifax.

METROPOLITAN DISTRICT MEETING.

An inspection of the St. Albans sewage disposal works will be made by the members of the Association of Managers of Sewage Disposal Works on Saturday, September 28th, at 2 p.m.

The works comprise sedimentation tanks, sludge receiver, sludge distributing main, coarse contact beds, percolating filters, Fiddian travelling distributors, humus tank, final land treatment, &c. The pumping plant comprises a Teasdale suction-gas plant, two 12 h.p. gas engines, and two 6-in. centrifugal pumps.

PROGRAMME

Assemble at entrance to works near Park-street Station (L. and N.W. Rly.).

The party will be conducted over the works by Mr. A. Eade, the manager, who will explain the system of treatment.

A paper will be read by Mr. H. Howard Humphreys, Westminster.

His Worship the Mayor and other members of the corporation have promised to be present.

Those attending to be present will please notify the undersigned on or before Thursday, September 26th.

JAS. CRAIG,
Hon. District Secretary.

66 Empress-avenue,
Manor Park, E.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, LEWES.

At a meeting of the Royal Sanitary Institute, to be held at the Town Hall, Lewes, on Friday, October 4th, at 7 p.m., Mr. D. Roberts, the borough surveyor of that town, will open a discussion on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams," among those advertised to take part in the proceedings being Messrs. John H. Blizard, ASSOC.M.INST.C.E., Southampton, A. J. Martin, M.INST.C.E., Westminster, and A. E. Prescott, borough engineer and surveyor, Eastbourne.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute.

On the following morning the members will visit the Pipe-x Brickwork, and the Lewes Portland Cement and Lime works, and in the afternoon inspect the Lewes Victoria Hospital, the borough isolation hospital, the fire brigade station, and the waterworks.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

DISTRICT SURVEYOR.—September 21st.—Mutford and Lothingland Rural District Council. £125 per annum.—Mr. E. S. Norton, clerk.

TOWN PLANNING ASSISTANT.—September 23rd.—Corporation of Halifax. £150 per annum.—Mr. Percy Saunders, town clerk.

ROAD FOREMAN.—September 23rd.—Rushden Urban District Council. 35s. per week.—Mr. W. B. Madin, engineer and surveyor. Applications to be endorsed "Road Foreman."

CLERK OF WORKS.—September 23rd.—Deptford Borough Council. £3 10s. per week.—Mr. V. Orchard, town clerk.

ENGINEER'S ASSISTANT.—September 25th.—Watford Urban District Council. £100 a year.—Mr. W. Hudson, clerk.

INSPECTOR OF NUISANCES AND SURVEYOR.—September 25th.—Skegness Urban District Council. £100—£150.—Messrs. Tweed Stephen & Co., clerks.

INSPECTOR OF NUISANCES.—September 28th.—Corporation of Bradford. £85 per annum.—Mr. F. Stevens, town clerk.

CITY ARCHITECT AND SURVEYOR.—September 28th—November 1st.—Corporation of Calcutta. £90 per month.—The Hon. S. L. Maddox, C.S.I., I.C.S., chairman of the Corporation of Calcutta, East India United Service Club, 16 St. James's-square, London, S.W., or (up to November 1st) Mr. C. C. Chatterjee, secretary, Corporation of Calcutta.

CLERK OF WORKS.—October 2nd.—Hayes Urban District Council. £3 per week.—Mr. C. D. Lewis, clerk.

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

DEPUTY CITY SURVEYOR.—October 19th.—Corporation of Manchester. £500 per annum. Mr Thos. Hudson, town clerk. Applications to be endorsed "Deputy City Surveyor."

ASSISTANT ENGINEER.—For the Government Waterworks in the Gold Coast. £650 per annum. Age between twenty-five and forty. Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W. Quote M. 5,605 on left-hand top corner of application.

ASSISTANT ROADS ENGINEER. Government of Southern Nigeria. £300—£400.—Mr. A. M. Buchanan, Government contractor, Suffolk House, Laurence Pountney-hill, E.C. Preference given to a man trained by the Kent municipal engineer.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

RANGOON.—September 28th—February 1st.—The date in the conditions in Clause 28 has been altered from August 31st to September 28th and in Clause 14 from January 1st to February 1st, 1913. The latest date for posting letters to reach Rangoon by February 1st will be by the Indian mail of January 10th.

LLANELLY.—September 30th.—Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium.—Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

LLANDUDNO. October 31st.—Designs for laying out about 20 acres, for the urban district council. A premium of 50 guineas is offered.—Mr. A. Conolly, clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas. —Mr. J. Henry Field, town clerk.

ROSCREA.—November 1st.—Plans, specifications, and estimates of a sewerage system, for the Roscrea No. 1 Rural District Council. £21 to be awarded to the best plan. -Mr. T. Hoodley, clerk, The Workhouse.

ORSETT (Essex).—January 1st. For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

ENFIELD.—September 23rd.—For the erection of medical superintendent's quarters and four cottages, for the Joint Hospital Board.—Mr. R. Collins, Public Offices, Enfield.

BLACKBURN.—September 23rd.—For the erection of public halls, for the corporation.—Mr. L. Beard, town clerk.

STAFFS.—September 23rd.—For the erection of a school, for the Education Committee.—Mr. Graham Balfour, director.

BOURNEMOUTH.—September 23rd.—For the erection of a fire station and other works, for the corporation.—Mr. F. Lacey, borough architect.

HAMPSHIRE.—September 24th.—For the erection of a corrugated iron cookery room, for the county council. Mr. A. L. Roberts, architect, The Castle, Winchester.

LANARK.—September 24th.—For the construction of two bridges, for the county council. Mr. W. E. Whyte, district clerk, District Offices, Hamilton.

SOUTHAMPTON.—September 24th.—For the erection of a corrugated iron cookery room for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

SOMERSET.—September 25th.—For the erection of an infants' school, for the county council. County Education Office, Weston-super-Mare.

SALFORD. September 26th. For alterations and additions to town hall and sessions court, for the corporation. Mr. J. B. Broadbent, 15 Cooper-street, Manchester.

GLAMORGAN. September 25th. For improvements and alterations to schools, for the county council. The Clerk, County Hall, Cardiff.

HAMPSHIRE.—September 26th.—For the erection of a classroom and alterations to building, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

MONTGOMERY.—September 26th.—For the erection of a school, for the Education Authority.—Mr. L. Phillips, clerk, County Education Offices, Newtown.

HALIFAX.—September 27th.—For the erection of a staircase at a school, for the Education Committee.—Mr. W. H. Ostler, secretary, Education Offices.

NELSON.—September 28th.—For the construction of a bridge, for the corporation.—Mr. W. Shackleton, borough engineer.

GREAT YARMOUTH.—September 30th.—For extensions to the fire brigade and police station.—Town Clerk.

ENFIELD.—October 1st.—For the erection of a school and cottage, for the Education Committee.—Mr. N. Hepworth, clerk.

LONDON.—October 1st.—For the erection of training college and hostel, and adapting existing house for a hostel, for the county council.—Sir Laurence Gomme, clerk.

NORTH RIDING.—October 2nd.—For the erection of a cookery and manual instruction room, for the Education Committee.—Mr. J. C. Wrigley, secretary, County Education Offices, Northallerton.

GREENOCK.—October 2nd.—For the erection of a school, for the School Board.—Mr. A. F. Niven, clerk, Municipal Buildings, Greenock.

SOUTHEND-ON-SEA.—October 2nd.—For the erection of pumping station and destructor buildings, inclined roadway, two cottages, and other works at the sewage disposal works, for the corporation.—Mr. H. J. Worwood, town clerk.

ALTRINCHAM.—October 7th.—For the erection of a public convenience, for the Sanitary Committee.—Mr. H. E. Brown, surveyor.

Iron and Steel.

MERTHYR.—September 23rd.—For the supply of cast-iron pipes and specials, for the corporation.—Mr. T. A. Rees, town clerk.

WHITEFIELD.—September 24th.—For the supply of ten ventilation columns, for the urban district council.—Mr. G. M. Denton, engineer and surveyor.

LONDON.—September 27th.—For the supply of cast-iron segments, for the Metropolitan Water Board.—The Clerk, Savoy-court, Strand, W.C. Tenders to be endorsed "Tender for cast-iron well segments, Shortlands."

LEEDS.— September 30th—October 7th.—For the erection of steel and corrugated-iron building, and constructing surface-water drainage, for the Tramways Committee.—Chairman of the Tramways Committee.

BRIDLINGTON.—September 30th.—For carrying out a water main extension, for the rural district council.—Mr. Geo. Hankinson, clerk.

HARROGATE.—September 30th.—For the extension of the royal pump-room, for the town council.—Mr. C. E. Rivers, borough engineer.

Roads.

TAMWORTH.—September 21st.—For the supply of granite, for the rural district council.—Mr. H. J. Clarson, surveyor of highways.

SMALLTHORNE.—September 23rd.—For carrying out street works, for the urban district council.—Mr. G. Phillips, clerk.

FELTHAM.—September 23rd.—For the supply of granite, for the urban district council.—Mr. G. Stevens, surveyor. Tenders to be endorsed "Tender for granite."

NANTYGLO AND BLAINA.—September 23rd.—For the supply of limestone granite, limestone chippings and granite chippings, for the urban district council —Mr. H. J. V. Shepard, clerk.

UXBRIDGE.—September 23rd.—For work of steam rolling and scarifying, for the urban district council. -Mr. W. T. Harvey, clerk.

RUNCORN.—September 23rd.—For making-up work with tar-macadam and ordinary macadam, for the rural district council.—Mr. H. Swetenham, surveyor, 49 Northgate-street, Chester.

HANWELL.—September 23rd.—For the supply of broken Guernsey granite, Kentish pit flints and distilled tar, for the urban district council.—Mr. Percy Scott, clerk.

PLYMOUTH.—September 23rd.—For making up several streets, for the town council.—Mr. J. Paton, borough engineer.

BLAINA (Mon.). September 23rd. For the supply of limestones, granite and chippings, for the urban district council.—Mr. W. J. Davies, surveyor.

BROMLEY.—September 24th.—For work of making up, for the corporation.—Mr. F. H. Norman, town clerk.

TOTTENHAM.—September 24th.—For the disposal by the urban district council of a 10-ton steam roller, fitted with scarifier.—Mr. Edward Crowne, clerk.

TOTTENHAM.—September 24th.—For the supply of a 10-ton single-cylinder steam road roller, fitted with an approved road scarifier, for the urban district council.—Mr. Edward Crowne, clerk.

ST. NEOTS.—September 24th.—For the supply of broken granite, Rocmac and Ferromac, for the urban district council.—Mr. J. Edey, surveyor.

SHOEBURYNESS.—September 24th.—For the supply of broken granite, for the urban district council.—Mr. F. Gregson, clerk.

FLEET.—September 24th.—For the supply of macadam, shingle and hoggin, for the urban district council.—The Surveyor.

SHERBORNE.—September 24th.—For forming a new road and footpath, for the urban district council. Mr. Duncan Brown, surveyor.

HARWICH.—September 25th.—For making up a road, for the corporation.—Mr. F. H. French, borough surveyor. Tenders to be endorsed "Making up of South Cliff-road."

WANSTEAD.—September 25th.—For work of steam rolling, for the urban district council.—Mr. Bruce Blewitt, clerk.

WILTON.—September 25th.—For the supply of flints, for the rural district council.—Mr. G. M. Wilson, clerk, 12 Bridge-street, Salisbury.

HAMMERSMITH.—September 25th.—For work of paving, for the borough council.—Mr. H. Mair, borough surveyor.

ENFIELD.—September 25th.—For private street works in parts of Durants-road and Malvern-road, for the urban district council.—Mr. T. W. Scott, clerk.

BELFAST.—September 25th.—For the supply of setts, for the Harbour Commissioners.—Mr. W. A. Currie, secretary.

KIRKHAM.—September 25th.—For making up a private street, for the urban district council.—Mr. W. J. Dickson, clerk.

GRIMSBY.—September 26th.—For road improvement work, for the rural district council.—Mr. J. F. Wintringham, clerk.

COCKENZIE.—September 28th.—For the construction of macadam roads, for the town council.—Mr. R. Tulloch, burgh surveyor.

KNUTSFORD.—September 30th.—For making good certain roads, for the urban district council.—Mr. E. L. Ashworth, clerk.

FAVERSHAM.—September 30th.—For the supply of granite or basalt, and chippings, for the corporation.—Mr. G. Tassell, town clerk.

SHREWSBURY.—September 30th.—For making up Water-street, for the corporation.—Mr. W. Chapple Eddowes, borough surveyor.

CHICHESTER.—October 1st.—For the supply of 1,000 tons of 2-in. broken granite, basalt, or other approved material, for the corporation.—Mr. J. W. Loader, town clerk.

TANGIER.—October 3rd.—For the construction of a road 1¼ miles long, for the Committee of Public Works.—Specifications may be obtained at the Intelligence Branch of the Board of Trade, 75 Basinghall-street, E.C.

SWANSEA.—October 3rd.—For works of road widening, for the rural district council.—Mr. E. Harris, clerk.

SHEERNESS.—October 15th.—For the supply of basalt or granite, Kentish ragstone, hoggin and Thames ballast, for the urban district council.—Mr. V. H. Stallon, clerk.

Sanitary.

NELSON.—September 21st.—For the laying of a pipe sewer, for the corporation.—Mr. W. Shackleton, borough engineer.

COLWYN BAY.—September 23rd.—For the construction of pipe sewer, for the urban district council.—Mr. J. Amphlett, clerk.

ALNWICK.—September 23rd.—For the construction of two inspecting sewers, for the rural district council.—Mr. H. W. Walton, clerk.

WHITEFIELD.—September 24th.—For the construction of sewerage and sewage disposal works, for the urban district council.—Mr. Chas. Bradshaw, clerk.

SOUTHAMPTON.—September 24th.—For the construction of soil and storm-water sewers, for the corporation.—Mr. R. R. Linthorne, town clerk.

DUNDEE.—September 24th.—For the supply of disinfectants and soaps, for the corporation.—Mr. W. H. Blyth, town clerk.

WIGAN.—September 25th.—For cleansing ashpits and cesspools, for the rural district council.—Mr. H. G. Ackerley, clerk.

LARNE.—September 25th.—For the execution of a complete sewerage scheme, for the rural district council.—Mr. S. M. Wallace, clerk.

REDDITCH.—September 26th.—For laying pipe sewers, for the urban district council.—Mr. A. J. Dickinson, engineer and surveyor.

COCKERMOUTH.—September 27th.—For the cutting of trenches, and construction of manholes, flush tanks, ventilators, sedimentation tanks, and percolating filters, for the rural district council.—Mr. J. B. Wilson, Grecian Villa, Cockermouth.

NELSON.—September 28th.—For the construction of sewers and sewage works extensions, for the corporation.—Mr. W. Shackleton, borough engineer.

SOUTHWICK.—September 28th.—For the construction of surface-water drains and outfall sewer, for the urban district council.—Mr. G. W. Warr, surveyor.

CAIRO.—September 30th.—For sanitary installations, for the Office of Public Works.—Administrative Service, Public Works Ministry, Cairo.

WATFORD.—September 30th.—For the supply of concrete tubes of 36 in., 30 in., and 21 in., for the urban district council.—Mr. W. Hudson, clerk.

BLEAN.—September 30th.—For the construction of sewage disposal works, for the rural district council.—Mr. F. A. Ward, Roseneath, Eddington, Herne Bay.

WATFORD.—September 30th.—For the construction of storm-water drainage and sewerage works, for the urban district council.—Mr. D. Waterhouse, engineer and surveyor.

TIPTON.—September 30th.—For the erection of public conveniences, for the Education Committee.—Mr. W. H. Jukes, surveyor.

STALYBRIDGE AND DUKINFIELD.—September 30th.—The Joint Sewerage Board notify that the time for the receipt of tenders for the extension of the Bradley Hurst works has been extended to September 30th.

EAST GRINSTEAD.—October 2nd.—For the construction of sewage disposal works, comprising detritus tanks, settling tanks, storm water, standing tanks, filter-beds, humus tanks, laying sewers and the construction of manholes, for the rural district council.—Mr. Francis S. White, clerk.

BRAILA (Roumania).—October 3rd—7th.—For work of drainage and laying conduits, at the estimated cost of £16,000, for the corporation.—Primaria Orasului Braila, Roumania.

BRADFORD.—October 9th.—For the construction of circular outfall sewer in tunnel, and two shafts, for the corporation.—Mr. Frederick Stevens, town clerk.

Stores.

FOLESHILL.—September 24th.—For the supply of brushes, spades, picks, cement, road lines, petroleum, Vax cylinder oil, engine oil, and cotton waste, for the rural district council.—Mr. A. P. Oswin, clerk.

Miscellaneous.

BROADSTAIRS.—September 23rd.—For water-softening house and ferro-concrete tanks, cast-iron pipes and specials, and sluice valves, for the urban district council.—Mr. L. A. Skinner, clerk.

ANDOVER.—September 24th.—For paving, sewerage, construction of water main and services, and team work, for the corporation.—Mr. R. Walter Knapp, borough surveyor.

KINGSTON-UPON-THAMES.—September 28th.—For the supply of sulphuric acid, for the corporation.—Mr. Harold A. Winser, town clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

ABERDEEN.—For the extension of the fish market, for the corporation. Mr. W. Dyack, burgh surveyor:—

Mason and Bricklayer Work.—W. Farquharson & Son, Aberdeen, £2,173.

Steel Work.—J. M'Millan & Co., Glasgow, £2,137.

ASHINGTON.—Accepted for cleansing ashpits and privies, for the urban district council:—

Districts No. 1 and 4.—Ashington Coal Company, Northumberland, £975 and £3,784.

Districts 2and 3.—E. Davison, Ashington, £326 and £128.

Districts 5 and 6.—E. Curtis, Hirst, £864 and £589.

BLAYDON-ON-TYNE.—For making up a road, for the urban district council:—

H. Bowers, Rowlands Gill	£1,992
W. G. Armstrong, Blaydon-on-Tyne	1,592
Hisco & Smith, Rowlands Gill	1,577
Johnson & Strong, Stanley, Co. Durham	1,488
J. W. Henderson, Newcastle-on-Tyne	1,309
J. Friend & Co., Blaydon-on-Tyne	1,267
G. Armstrong, Whitley Bay	1,244
E. R. Dawson, Blaydon-on-Tyne*	1,118

BROMLEY.—For work of steam-rolling, for the rural council:—

Pamphlin & Sons, Cambs., 25s., 4s.

Chattenden & Summonds, Limited, Maidstone, 25s., 2s. 6d.

Edbrson Steam Rolling Company, Dorchester, 25s. 6d., 2s. 9d.

Thos. Rowley, Jun., West-green, N., 18s. 6d., 2s. 6d.

T. Wood & Son, Limited, Swanley Junction, 18s. per day, scarifying, 2s. per hour.*

The Surveyor

And Municipal and County Engineer.

Vol. XLII. SEPTEMBER 27, 1912. No. 1,080.

Minutes of Proceedings.

The Ventilation of Sewers.

In view of the renewed interest in the question of sewer ventilation caused by the recent Local Government Board report upon the intercepting trap, the paper by Mr. T. de Courcy Meade, M.INST.C.E., city surveyor of Manchester, which we print on another page, appears at a very appropriate time, and will be read with interest by all who have to deal with this problem. The paper is full of information, and the results of the experiments carried out in London and Manchester are particularly valuable. The observations on air currents in sewers showed that where sufficient free openings were provided the direction and force of the wind exercised a great influence, and overbalanced all other local conditions due to temperature, gradients, character of sewage, and so forth. This fact is now becoming more generally known, and is being recognised as the most important factor which has to be taken into consideration in any attempts to solve the problem. It is also undoubtedly the reason why the many ingenious methods of artificial ventilation and deodorisation have failed, in a greater or lesser degree, to produce the results which were anticipated. The author's conclusions are excellent and well set out. Although it is generally acknowledged that all sewers should be kept clean by flushing, this is not always carried out so thoroughly as it might be. The author's conclusion "that the *regular* and *efficient* flushing of sewers with fresh water is a more important desideratum than the introduction of large volumes of air . . ." is well illustrated by the case he quotes, and confirmed by the work done in Hampstead by the borough engineer and surveyor, Mr. O. E. Winter, A.M.INST.C.E. (See THE SURVEYOR August 16, 1912, pages 225 and 233.)

In the penultimate paragraph of his paper Mr. Meade refers to the experiments made by Professor Delepine, the results of which practically confirm those obtained by other investigators, which show that the presence of bacteria in sewer air, when found, is due to splashing or other disturbance of the sewage. It is specially interesting also to learn that an elaborate system of experiments has been commenced by Professor Delepine at the Public Health Laboratory, Manchester, to estimate the influence of sewer air upon health. In view of the conclusions arrived at by the Departmental Committee of the Local Government Board in its report upon the intercepting trap to the effect that, bacterially, sewer air is less dangerous than drain air, the result of these experiments will be anxiously awaited, as it is the one thing lacking in the Local Government Board report, and is required to satisfy those who view with distrust the recommendations for the abolition of the intercepting trap. In order to prevent adverse criticism, however, we suggest that these experiments should be conducted upon practical lines. For example, the sewer air used for the experiments should be taken after discharge at the top of a soil pipe on a house drain which is *not* disconnected from the sewer; in fact, the conditions which would exist if the recommendations in the Local Government Board report were adopted in their entirety should be provided.

* * * *

Rubber and Leather, as Measuring the Value of a Road Crust.

It is a fallacy that the cost of maintenance can be fully measured by money spent annually in the upkeep of a road regardless of other factors. The service performed by the road must necessarily be taken into consideration—that is, the value of the road compared with what it might be under the conditions brought about by reasonable variations in the methods adopted and materials employed. No comparison is here made between one road and another or one class and another, these remarks being confined to a consideration of the value of any particular kind of road-crust on a given road as regards both its cost and its value to the public. As regards a considerable number of the comparisons that can be made between one of the possible road-crusts and another, these are matters which cannot be dealt with by measure, but must be left to the judgment of the surveyor. Small differences in the total effort of hauling upon different surfaces, slight differences in the tendency of vehicles to sideslip, the effect of a slippery surface in reducing the average speed of vehicles—these and other considerations may be taken into account, but they cannot be measured or even estimated except by an effort of imagination coupled by sound judgment and a knowledge of the local requirements of the public. There are, however, a considerable number of items which can be measured, roughly at any rate, or may be the subject of estimation based upon partial but significant data.

We allude to such matters as the effects of certain materials used in the road-crusts upon the wear and tear of boots and shoes and of rubber tyres, including the important matter of punctures. It would not be difficult to make in an actual case a fair estimate of the mileage life of bicycle tyres upon different kinds of road surfaces, and the

average number of miles per puncture. The average life of both tyres should be taken, because some kinds of roads are relatively less or more severe upon front or back tyres. The rough enumeration of the number of bicycles passing along a given road with a specified kind of road crust will then furnish us with an estimate of the total amount of loss on that road. The basis of comparison may be either the best possible kind of surface, the difference in cost being accounted as a loss, or added to the cost of maintenance, or the worst kind of road may be taken as a starting-point for comparison of the differences expressed as a saving due to the particular kind of material employed and the method of making the crust. Another item which can be roughly estimated is the wear and tear of boots and shoes. On very rough roads a considerable amount of damage is done by actual cuts produced by sharp stones, but generally on ordinary roads what matters is the rate of wear of the soles. Due regard should be paid to the habits of the population; thick-soled boots furnished with stout hobnails do not suffer nearly so much as the boots usually worn by the upper classes and by women, and this must be duly considered in the enumeration of pedestrians, which will form the basis of this estimate. There is a considerable number of other items which have to be taken into account in the present connection, but the two already considered, rubber and leather, are the most important.

* * *

Grays.

The Eastern District meeting of the Institution of Municipal and County Engineers which was held at Grays on Saturday last was a very pleasant and successful function from every point of view. Favoured as regards climatic conditions, and provided with an excellently arranged programme, the meeting was fully appreciated by the large number of members who were present. A pleasing feature of the meetings of the Institution is the almost invariable interest which is displayed in the proceedings by leading members of the local authority of the town in which the gatherings are held; and in this respect the town of Grays was no exception, the members being received on arrival by Mr. T. N. Banks, J.P., the vice-chairman of the urban district council. A preliminary piece of business had to be transacted in the formation of a District Executive Committee (and the fact that of the twelve members elected three were deputy surveyors is both noteworthy and satisfactory), and this having been done, Mr. A. C. James, Assoc.M.Inst.C.E., the surveyor to the council, submitted his paper on "Municipal Works of Grays." This paper was a model of its kind inasmuch as it contained a careful epitome of the public works of the town, the author wasting no time in the discussion of unimportant matters or topics unsuited to the character and purpose of the meeting. The paper will be found in another column, and may be left to speak for itself.

The duties which have fallen to Mr. James as surveyor to the council have not been light, the whole of the works described in his paper, with two exceptions, having been designed by him and carried out under his supervision by direct labour; and the visits to the various works which took place in the afternoon showed that they have been well done in every way. In the course of the discussion which followed the reading of Mr. James's paper two matters received special attention. These were the remarkably low cost of road maintenance and the desirability of the standardisation of road materials. The cost of surface dressing at Grays has been kept at a low figure. The president, in closing the discussion, referred to the question of standardisation, which was raised by Mr. James. He agreed—and this is now the general opinion—that the standardisation of road materials can only be described as a crying need, and he expressed the opinion that the efforts of the Standards Committee would have results which would be of great benefit to the members in this direction. We need only add that any such results will be both widely and deeply appreciated.

Colonel Crompton and Calumny.

Under the caption "New Type of Road Surface: the 'Carpeting' Principle," we give elsewhere in this issue a brief chronicle of the laying in London of the new type of road surface which has been devised by Colonel R. E. Crompton, and has been the subject of much discussion of late. Since The Surveyor first saw the light we have read, especially in the general Press, of about as many discoveries of "the perfect road" as there are religions in the world or sauces in France; but, like the source of life, that highway is still to seek. We are cautious, therefore, in committing ourselves even to qualified prophecy as to Colonel Crompton's device. Time will test it, and the result will be waited for with the greatest interest. Meanwhile we take the opportunity of making an authoritative statement, which we hope will dispose of certain voiced and printed calumnies that are all unjustified and some malignant. It has been said, to meet the matter squarely and plainly, that Colonel Crompton, though an official of the Road Board, is "out," as the Americans have it, to increase such remuneration as he receives in that capacity by trading in the manufacture and laying of his road surfacing. Personally we should have nothing adverse to say if this were so. We do not know the detailed conditions under which Colonel Crompton gives his scientific services to the Road Board, and if we did we should take it that the observance of those conditions is solely a matter between that body and their official. What is of public concern is the advancement of road engineering, and if Colonel Crompton has in any degree effected this it is immaterial whether he be a Government or local government official, a manufacturer, or an airman. But in fact Colonel Crompton has not made, is not making, and does not propose to make a penny piece out of the supply and laying or the use of his road surface. There is no secret about its composition or magic in its manufacture, and anybody who is competent can make and lay the Crompton pavement in accordance with the specification of its inventor. If his device triumphantly emerges from the test of sufficient practical trial, Colonel Crompton must be ranked as a public benefactor of the highest self-effacing type; meanwhile, by the irony of fate, he has been assailed by more ignorant abuse than is usually suffered—even by pioneers.

* * *

Seizing the Opportunity.

The policy of delaying street improvements which are urgently required for reasons either of public health or of traffic requirements is usually not to be commended, and where adopted the underlying reason is ordinarily a desire to effect an immediate economy without regard to possible exorbitant expenditure in the future. A case in point has recently arisen at Berwick-on-Tweed, and we mention it chiefly in order to congratulate the borough surveyor (Mr. R. Dickinson) on his exceedingly wise and courageous report. It appears that a public house situated at the corner of two very narrow thoroughfares is to be rebuilt, and that the plans have received the approval of the justices. The question of setting back was therefore directly and urgently raised, and in the course of a report on the subject Mr. Dickinson refers to previous cases in which buildings had been re-erected without the opportunity being taken of effecting necessary public improvements. The report concludes with the following paragraph:—"I have not referred to the question of cost—the determining factor in so many issues, but in this it ought not to

rule. A matter of this kind, embracing as it does the abolition of the congestion to traffic, inconvenience and danger to the public, defective circulation of air, and unhealthy conditions, should be decided on higher grounds than monetary considerations, and be treated as a matter of principle. If these conditions exist, as they surely do exist, no question of cost ought to delay their abolition for the benefit of the community. Similar conditions would not be allowed to continue in the hands of a private individual." With this view we cordially agree, and we venture to commend Mr. Dickinson upon the stand which he is taking to secure that in questions affecting public health decisions shall rest upon a higher ground than pounds, shillings, and pence.

* * *

Persecution: The Cause.

We are constantly hearing through the local press and from other sources of cases in which the surveyor to a local authority is made the target for a groundless attack on his personal or professional reputation or is subjected to a course of petty persecution which renders his position intolerable. When the attack is made in public (which is by no means always the case) the prime mover usually commences by disclaiming any prejudice or personal hostility. Such statements are capable of being easily appraised, and may usually be disposed of by adding "*Qui s'excuse s'accuse;*" for there are three customary grounds of such baseless attacks, and merely to state them is to put an unanswerable case for Government protection. In some gross instances it is sought to get rid of a surveyor simply in order to appoint a desired new man in his stead; more commonly, a certain type of councillor, who by education and training is incapable of appreciating the difference between a navvy and an engineer, is moved by something akin to jealousy to harass an official who is "highly paid by the ratepayers," and who in his opinion ought to be a "practical man" satisfied with a weekly wage; the most usual cause of the trouble, however, is the interested councillor with whom the surveyor has come into collision in the conscientious discharge of his duties. Hardly a week now passes without a case of one of these types occurring, and the question of Government protection or security of tenure is becoming one of increasing urgency. It is usually coupled with the demand for superannuation, but the two matters are not inseparable, and we would suggest that the Institution of Municipal and County Engineers should take steps to obtain reliable evidence of some typical cases and submit them to the Local Government Board with a request for some effective departmental or legislative action.

* * *

Sterilisation of Sewage Effluents.

The sterilisation of sewage effluents at small works, though such a difficult matter in scientific discussions, is so simple in actual practice that it is apt to be overlooked when the works are described. The addition of a little hypochlorite of lime to an effluent is a much easier matter than its application to a water supply, seeing that there is no question of a taste or smell arising from the minute quantity of chlorine which may remain in the water after an overdose. From time to time we read descriptions such as that of the works at Pleasantville, recently quoted in these pages, or that of the works to deal with 564,000 gallons of sewage per day in Pennsylvania, which show that in America it is usual to sterilise sewage effluents which are likely to cause trouble.

It will be observed that at Pleasantville reliance is placed in the process of sterilisation as affording sufficient proof that an ice-pond used for the supply of ice to New York is not polluted with harmful germs, with the idea that this will be a safeguard against any legal proceedings. At the works we describe in the present issue it will be seen that a Pennsylvanian State institution has adopted the process. It may be that there are few places in this country where such works are required, but there can be no doubt as to the ease with which sewage effluents can be sterilised in practice. The adoption of sterilisation of sewage effluents in America at various places is also referred to in Mr. Fuller's recently published book upon sewage disposal. It is thus difficult to understand why the sewage effluents from hospitals for infectious diseases should ever be allowed to escape where pollution is remotely possible without sterilisation.

* * *

Motor 'Buses and Road Maintenance.

The undoubted grievance which is suffered by the ratepayers of many suburban districts in being compelled to pay an increased rate for road improvements which are necessitated entirely by the advent of the motor omnibus was strongly voiced at the Richmond conference on the subject, which we report elsewhere. It is claimed that an equitable share of the petrol tax should be allotted to the work of improving roads which are unsuited to the new traffic requirements. A specific instance occurs in Richmond, where Kew-road is being converted from macadam to wood at a cost of about £20,000. This work follows as a necessary consequence upon the increase of motor omnibus traffic, and it seems only reasonable that the omnibus company should be asked to pay their share of the expense. This they might do, in part at any rate, through the petrol tax, were it not for the limited interpretation which the Road Board put upon their own powers. The demand is clear, and the outer London authorities are unanimous in asking that the petrol tax should be handed over to those who have to pay for repairing and improving roads which the motor omnibuses destroy. If the Road Board cannot lawfully do this, we hold that a case for such legislation as may be necessary to enable them to comply with the demand has been abundantly made out.

* * *

The L.C.C.—a New Enterprise!

We have before us a copy of a rather extraordinary document which emanates from the Estates and Valuation Department of the London County Council. It appears that the council have revised and are keeping up to date a set of ordnance-sheets of the county, and they have issued a circular offering to supply tracings of the revised portions at stated charges, or to give special quotations for larger orders. We understand that this circular has been sent to surveyors, but we are not aware how much wider its circulation has been. We would point out, however, that if such tracings are supplied to the general public, the council are setting up the business of surveyors, and that their competition with the existing members of the profession in practice within the county will operate very hardly.

* * *

Chlorine or Hypochlorites.

An article by Mr. Eric Rideal on the respective merits of chlorine and hypochlorites for the sterilisation of water is given elsewhere in these pages. It is interesting to note that this statement from the chemist's point of view bears out exactly what was said in our minute of September 20th, dealing with the proposals of Dr. D. D. Jackson, of New York, given in his paper read before the American Waterworks Association. We then pointed out that chemists would not readily agree that sterilisation by means of chlorine gas would produce the same results as sterilisation by means of hypochlorites. Mr. Rideal shows very clearly that there are grave disadvantages to the use of chlorine gas, and his article is a valuable contribution to the literature of the subject.

The Ventilation of Sewers.*

By T. DE COURCY MEADE, M.Inst.C.E., City Surveyor of Manchester.

In England sewers were originally constructed for the purpose of conveying storm waters from roofs, street surfaces, yards, and so forth, to the nearest rivers or streams, and the admission of fæcal matters into sewers was forbidden by law. When the water-carriage system of sewage came into vogue in the early part of the last century sewers were gradually utilised for the reception of the overflow of liquids from cesspools and for the removal of house drainage. The admission of excremental matters into sewers was not only legalised, but made compulsory in London in 1847, and in the rest of England in the following year.

Prior to that time sewers were constructed with large open shafts placed at or near to the side walks for the admission of surface waters: these shafts were untrapped and were covered with grids of large size. There were no ventilating shafts in the centre of the carriageways, nor were there any side entrances for gaining access to the sewers. Ventilation was therefore effected by the gully shafts, the effluvium from which gave rise to very general complaint in London as early as 1830, and as the use of sewers for the conveyance of fæcal matter was extended, these complaints became intensified. Public attention was consequently directed to the subject with the object of devising some means of remedying this evil, with the result that in London and some other English towns the gullies were trapped and shafts were erected in the centre of the carriageways to admit of the escape of the sewer gases at points as far removed from the houses and side walks as practicable; this system was completed in the City of London by the end of 1848. The arrangement, however, did not remove the nuisance; it merely transferred it from the sides to the centre of the streets, most of which are narrow, with carriageways largely used by pedestrians.

In 1852 the English Board of Health advised the ventilation of public sewers, and in 1878 "suggestions" as to the preparations of plans for main sewerage, &c., were issued under the direction of Sir Robert Rawlinson, C.B., the Chief Engineering Inspector to the Local Government Board (the successors to the Board of Health). The Local Government Board advocated:—

(*a*) Sewers constructed in straight lines.

(*b*) Manholes or lampholes at each change of direction and gradient, and terminating at the street surface.

(*c*) The trapping and ventilation of all house drains.

The advice given by the Government Department has been generally followed by English engineers in the design of drainage works in Great Britain, but the sewer-gas problem still remains unsolved, and the nuisance from sewer emanations continues. . . . Numerous proposals have in the past been made for abating the nuisance caused by sewer gas; for example, mechanical ventilation by means of fans, specially constructed shafts with furnaces to extract and consume the gases, flexible screens to regulate the air currents, connections with factory chimneys, and numerous methods of chemical deterioration were suggested and tried more than fifty years ago with varying results.

EARLY DEVICES.

The old fallacy that the application of the principles successfully used in ventilating mines would be equally successful if applied to sewers is still retained by some theorists. Those who know how widely dissimilar the conditions are can readily appreciate that the remedial measures which prove successful in the one case may be worthless in the other. Plenum or vacuum systems, either separately or in conjunction, can be applied to mines, sufficiency of power being the principal factor; but in sewers dependent on water-sealed drain traps the application of power sufficient to produce an effective current of air throughout a large system is impracticable.

Most municipal engineers are conversant with the methods here referred to, and doubtless with many others too numerous to mention. They are well aware of the conditions that have to be met and of the impracticability of the suggestions put forward by many inventors, whose proposals, although sometimes of undoubted ingenuity, are generally found lacking in essential points.

Among the earliest suggestions should be mentioned those for deodorising the sewer gases by the admixture of chlorine gas and other chemically produced gases, the application of vegetable charcoal as a deodoriser, and the admission of smoke from factory chimneys forced into the sewer by water-driven fans.

The oxidising effect of charcoal, which had been determined by the researches of Lowitz, Saussure, Thenard and others in the latter part of the eighteenth century, was, at a later period, investigated by Drs. Stenhouse, Grace-Calvert, Letheby, and others; and under the direction of Colonel Haywood, when City engineer of London, this material was utilised for purifying sewer air by means of trays inserted in the ventilating shafts. Several mechanical arrangements were devised for the practical application of charcoal to this use, notably those of Messrs. Bean and Burgess, and later the spiral tray ventilator of Mr. Baldwin Latham.

The ventilator devised by the last-named gentleman possessed many advantages over the arrangements which preceded it, but in practical use it was found that charcoal, however skilfully applied, rapidly lost its power of deodorisation, mainly owing to the moist atmosphere with which it was necessarily brought into contact. Charcoal, therefore, failed to act as a useful deodoriser unless the ventilators were recharged with it very frequently. The air currents also within the sewers were reduced by its introduction. This was fully recognised by Lieut.-Colonel Haywood and Dr. Letheby, who were careful to point out that, while charcoal diminished the escape of effluvium into the streets, it was essential that the dilution of the gases generated in the sewers should not be so lessened by the diminished air supply as to render the atmosphere in the sewers dangerous to the men who work in them. These investigators, however, candidly admitted that, on the other hand, the diminution of the air currents did not appear to have any appreciable effect on the condition of the air within the sewers. The use of this material has been abandoned in the City of London and most other British towns where it had been tried.

The necessity for ventilating sewers conveying fæcal matter was generally recognised by most of the leading English engineers, notably by such pioneers as Mr. Frank Foster, Sir Joseph Bazalgette and Lieut.-Colonel Haywood, engineers whose names are well known in connection with the main drainage of London. Recent research, however, indicates that this view must be accepted with some reservation.

Since the period more particularly referred to (1840-70) many methods have been tried experimentally in towns in Great Britain, and much has been written on the subject, not infrequently by those who have had no opportunity for personal research. The author has had the advantage of closely studying the practical aspect of the problem, first under the direction of Lieut.-Colonel Haywood in the City of London, subsequently in other British towns, and more recently in conjunction with Prof. Delepine and other experts at Manchester.

ENGLISH AND AMERICAN PRACTICE.

He proposes in the first place briefly to refer to the systems in use in some of the principal English and American towns. A few years ago information was kindly furnished to him by the municipal engineers of upwards of sixty of the principal towns in the United Kingdom, and of several important towns in Canada and the United States, from which it appears that the methods adopted in various towns differ considerably, even in cases where the local conditions are somewhat similar.

For example, we find that Belfast adopted a system of ventilation at the surface of the streets somewhat similar to that already described in relation to the City of London, Birmingham a combination of surface grids and high ventilating shafts, Bristol practically unventilated sewers, and Leicester ventilation by openings at the street surface, superseded by high-shaft ventilation.

The cities of Buffalo, Chicago, Detroit, Minneapolis,

* Paper submitted to the recent Congress of the Royal Institute of Public Health in Berlin.

Philadelphia, Washington, Boston (U.S.), and Toronto adopted surface ventilation with—it is alleged—fairly satisfactory results, the house drains being cut off from the sewers by intercepting traps in seven out of the eight cities named.

Of the sixty towns in England from which information has been derived, we find that eight towns adopted ventilation by surface grids only; five, a complete system of trapped house drains; four, untrapped street gullies; twenty, surface ventilation supplemented by high shafts; twenty-three, a combination of surface inlets and high shaft outlets; four, trapped drains, and sewers ventilated by high shafts only. The sizes given of the ventilating pipes and shafts vary from 4 in. to 12 in. in diameter, according to the size of the sewer. These are usually placed about 150 yds. apart, and in the majority of cases they are fixed against buildings.

In one town the ventilating shafts are supplemented by brick structures 42 ft. in height, with a sectional area of 9 sup. ft.

BRISTOL.

The method adopted at Bristol is of special interest, as that city is an exception to the rule prevailing elsewhere, being the only large town in England in which no attempt has been made to ventilate the sewers systematically, but the author is informed that the sewer workmen in that city have met with no accident due to poisoning, suffocation, or explosion for many years, although the sewage is combined with trade refuse from breweries, soapworks, tobacco manufactories, cocoa works, tanneries, and so on. The death-rate also compares favourably with that of other towns of similar size and character, being 12·71 per 1,000 in 1911.

In one town, where the brewing industry forms a large proportion of the trade, the sewers are ventilated by connections with tall chimneys. Surface ventilators are not used owing to the objectionable smell arising from the brewery refuse, and the sewers in the residential portions of the town are not directly connected with the main drainage system; sewers in the residential areas are ventilated by high shafts. In another town situated on the South Coast of England the sewage is practically free from trade refuse, but considerable difficulties have been experienced in dealing with the emanations from sewer ventilators, and many methods, such as open gratings, tall shafts, specially devised surface grids and cremation by lamp ventilation, have been tried to obviate the nuisance, but these systems have been found unsatisfactory and discarded, either wholly or partially.

Taking as another example a fashionable residential town in the South-West of England, where the sewage is mainly of a domestic character, there are no surface ventilators, only a comparatively few ventilating shafts being in use; all modern house drains are trapped, and complaints of nuisance are seldom made. Another example will be found in a residential town of about 50,000 inhabitants not far removed from the place last referred to. There is no system of sewer ventilation, the sewage is of a domestic character, the house drains are trapped. Some of the sewers have flat gradients and flushing is resorted to. The public health and death-rate compare favourably with other towns of the same size and character.

In forty-seven of the towns previously referred to the flushing and cleansing of the sewers is systematically carried out. In eleven the sewers have little fall; in four the falls are considerable; in thirty-two the gradients vary; in seven the sewers that have flat gradients are flushed. In six (some of the latter being of considerable size) the sewers are not flushed.

In most of the American towns from which information has been received flushing is systematically carried out.

From the foregoing remarks it will be seen that the modern practice regarding sewer ventilation in England varies greatly, and where ventilation on a uniform system has been attempted the methods adopted have in most cases been subsequently modified to meet the difficulties that have arisen. When nuisance has been experienced by smell from ventilators terminating at the street surface, the remedy most generally adopted by English engineers has been the substitution of vertical shafts fixed in suitable positions and supported by buildings or independently. This arrangement affords a better diffusion of the gases emanating from the sewers, and frequently obviates the complaints by transferring the nuisance from the surface of the streets to a higher point, but it cannot be accepted as a satisfactory solution of the problem.

In the city of Manchester the tramway standards have for some years past been utilised as sewer ventilators, and the results have been fairly satisfactory.

AIR CURRENTS IN SEWERS.

The direction and velocity of the flow of air in sewers have been carefully investigated for a period of upwards of sixty years in several towns in England, commencing with the well-known series of experiments conducted in the City of London under the direction of Lieut.-Colonel Haywood about the middle of the last century.

Temperature observations conducted by the author in London and in Manchester show that the conditions in winter and in summer are reversed, the air in the sewers being warmer than the external air in winter and cooler in summer. These conditions, however, vary largely with climate and the character of the sewage, and the latter varies materially in different parts of some large towns where manufactories predominate. Some twenty-five years ago the author made an investigation of air currents in sewers and in pipe ventilators. A number of metal and earthenware pipes varying in diameter and in height were erected; some were placed vertically, both with and without bends, others were erected at different angles for the purpose of experiment. It was found that each pair of right-angled bends diminished the efficiency of an ordinary 4-in. metal pipe in calm weather by from 7 to 10 per cent, but this was largely varied when there was wind. The experiments were carried on continuously for eight months, and the pipes were afterwards used for ascertaining the extracting value of different kinds of cowls. Some of the cowls tested were found useful under certain conditions in preventing down draught, and some of them increased the up current in windy weather.

In experiments on two 30-ft. lengths of 4-in. cast-iron ventilating pipe of heavy section it was found that under favourable conditions the heat of the sun's rays was sufficient to alter the direction of the air currents in a length of 76 ft. of 6-in. diameter house drain, laid with a fall of 1 in 45. One pipe experimented upon was exposed to the south-east and the other to the north-west. With three exceptions the pipe exposed on the south-east was the upcast shaft in the earlier part of the day and the downcast shaft shortly after the sun's ray passed to the other side of the building. The exceptions occurred on days when the wind was high. The experiments were conducted on these latter pipes during hot weather only.

The observations on air currents in sewers showed that where sufficient free openings were provided the direction and force of the wind exercised a great influence and overbalanced all other local conditions due to temperature, gradients, character of sewage, and so forth.

Before the instruments were allowed to record, it was found necessary to restore the normal conditions within the sewer which are invariably disturbed by the opening of manhole or side entrance covers for the purpose of entry when placing the recording instruments in position. To effect this the writer devised a small case of sufficient size to hold each anemometer. At opposite sides, and facing the fan of the anemometer, were hinged doors; these were opened by pneumatic pressure applied by a small tube brought to the surface. The doors were balanced to close when the pressure was released. By this means the instruments were not brought into use until the normal conditions within the sewer were restored. In order to check the record of each instrument while exposed to the action of the air currents, two anemometers were placed side by side suspended in boxes from the crown of the sewer, and an interval of twenty minutes was allowed to elapse before these instruments were independently brought into action by the means described. Eight instruments in all were used and were carefully corrected from time to time during the progress of the work.

Records were taken under similar conditions with the ventilating spaces in the manhole covers closed and open for a distance of 1 mile on each side of the point of observation, and the results differed so slightly that the author came to the conclusion that the effect produced within the sewer by the ordinary type of ventilating cover was negligible. On the other hand, he found that the action of the wind and variation between internal and external temperatures on the open end of a large sewer, such as a storm overflow, will produce a very material current of air for a considerable distance along the sewer, but the

velocity of the current will gradually diminish, and in time cease altogether.

EFFECT OF WIND PRESSURE.

Where surface ventilating covers are used, wind pressure has undoubtedly an effect upon the air within the sewers, but even with high winds the author has found the effects much smaller than what has often been attributed to this cause.

These remarks apply to large sewers, sufficient for a man to enter. In the case of smaller sewers—pipes varying from 12 in. to 18 in. in diameter—he has found the effect of wind pressure on surface ventilators more pronounced.

In the type of ventilating manhole which has hitherto been in use in the city of Manchester, the proportionate ventilating area amounts to—

24·5	per cent of the cross sectional area of 12 in. diameter sewer.							
2·7	,,	,,	,,	,,	,,	3 ft.	,,	,,
·98	,,	,,	,,	,,	,,	5 ft.	,,	,,
·24	,,	,,	,,	,,	,,	10 ft.	,,	,,

The distances between the ventilating manholes varies from 100 yds. to 150 yds. in the case of the smaller sewers, and from 150 yds. to 300 yds. in the case of the larger sewers. It will therefore be seen that the effect of air pressures under such conditions must of necessity be much less in sewers of large section than in those of a smaller type.

The results of the author's observations may be briefly summarised as follows:—

(*a*) Where shaft ventilation only is relied upon, some of the shafts become inlets and others outlets.

(*b*) These conditions are not continuous, the directions of the air currents are at times reversed, the outlets acting as inlets, and *vice versâ*.

(*c*) The air currents within the sewers are governed to a large extent by the differences between the external and internal temperature, the flow of sewage, the construction and character of the sewer and other local circumstances.

(*d*) All these conditions are neutralised, and at times reversed by the change of direction and force of the wind.

(*e*) Ventilation by metal shafts is affected, and in some cases materially assisted, by the heat of the sun.

(*f*) No general rule can be laid down which would be applicable to all cases and under all conditions.

(*g*) Under normal conditions, in properly constructed and regularly flushed sewers not receiving trade refuse, the perceptible odours are less when they are unventilated than when ventilated.

(*h*) Air currents do not invariably flow from lower to higher levels, the reverse being frequently the case even where gradients are steep.

(*i*) Air in sewers in partial use is generally more offensive than that in similar sewers which are used to their full or nearly full capacity, other conditions being equal.

(*j*) That the regular and efficient flushing of sewers with fresh water is a more important desideratum than the introduction of large volumes of air. A case in support of this view may be quoted where intermediate manholes were inserted in an old sewer in fair condition, which increased the ventilation openings by 100 per cent, but did not appreciably improve the condition of the air within the sewer. Flushing was resorted to and a marked improvement was immediately effected.

(*k*) All methods which replace or retard natural ventilation are inadvisable except under very exceptional circumstances.

(*l*) Ventilation of sewers is necessary for the safety of the workmen, and for the free escape of air when sewers are rapidly filled in times of storm.

(*m*) Methods usually adopted in the ventilation of houses cannot be successfully applied to sewers.

MANCHESTER CORPORATION'S INVESTIGATIONS.

In 1902 the Manchester Corporation appointed a special committee with a twofold purpose: First, to determine on the generally accepted hypothesis that the ventilation of sewers is necessary—the best method of accomplishing this object; secondly, to investigate the composition of sewer air bacteriologically and chemically obtaining under varying conditions, such as are to be found in the Manchester city sewers, and to determine as far as practicable the influence of these circumstances on health.

The committee appointed Prof. Delepine, M.B., C.M., M.Sc., Director of Public Health Laboratory, Manchester University; Dr Fowler, D.Sc., F.I.C., consulting chemist, Davyhulme sewage works; and the author, to investigate and report. Prof. Delepine undertook the bacteriological work, Dr. Fowler the chemical work, and the author the experimental installations, investigation of air currents, &c.

As a rule, when matters of public interest are about to be officially investigated in England, numerous remedies are suggested by irresponsible persons from outside. These were anticipated by advertisement in the public press intimating that the Special Committee were prepared to receive particulars of methods for improving the ventilation of sewers. In response to this invitation twenty replies were received. Most of them contained particulars of some proprietary arrangement or method of ventilating sewers. Each case was carefully considered, and four of those who responded were invited to furnish additional particulars, and after further consideration arrangements were made for a practical test of the method advocated in each of these four cases, which will here be referred to by the letters A, B, C, and D respectively.

Method A consisted of an electrically driven fan to extract air from the sewers and discharge it through an outlet shaft into the open air, fresh air being admitted to the sewers through inlet shafts fixed at suitable points to replace that extracted. The fan used in the experiments was 20 in. in diameter, and had a velocity of 650 revolutions per minute. It was driven by a 4 b.h.p. electric motor, placed in a brick chamber under the roadway. The upcast shaft was of steel, 20 in. in diameter, with an outlet 28 ft. above the road level. The base of the shaft was concreted into the side of the fan chamber and connected to it by a concrete duct. There were twenty-two fresh-air inlet shafts, 4 in. in diameter, varying from 5 ft. to 30 ft. high. Twenty were fitted with inlet caps by means of which the amount of air admitted at each inlet was adjusted so that the extracting power of the fan could be equally distributed throughout the whole system to be ventilated.

The area experimented upon in this case was 39½ acres. The sewers within that area had a capacity of about 25,000 cub. ft., and the resident population was about 3,000. The area included two cotton mills, an india-rubber works, a soapworks, an artificial manure factory, &c., two schools attended by 1,175 scholars; 322 water-closets and 186 pail-closets; the length of the sewers was about 5,560 yds. The area was, in fact, selected because the local conditions made the sewers within it the most difficult to ventilate that could be found in a city where from various circumstances the problems regarding the efficient ventilation of the sewerage system are, perhaps, among the most difficult and complicated in England.

The contractor who supplied the fan had guaranteed that it would discharge 6,000 cub. ft. of air per minute against a water pressure of an inch, but in actual use only 4,036 cub. ft. per minute was registered. Anemometer tests showed that 247 cub. ft. of air per minute was brought into the sewers through the air inlets, and that four of the inlets at times acted as outlets. The water gauge registered a vacuum of 1 in. in the pipe connecting the sewer with the 20-in. upcast shaft.

This system of ventilation produced a considerable dilution of the sewer air where the connections were good, but only a small proportion was drawn in through the regulated fresh-air inlets that were provided, and this notwithstanding that every care was taken, short of relaying the sewers, to make them air-tight; the system was, however, considered worthy of further investigation. The air escaping from the outlet shaft contained no more bacteria than the street air, and on some occasions much less. It had, however, an unpleasant smell, and it was considered doubtful whether there was any advantage in throwing into the street air at one point large quantities of bad-smelling gases such as escaped from the outlet shaft.

Method B consisted of a special type of lamp column placed on the footways or carriageways, and connected with manholes in the centre of the road or closet with the sewers by earthenware pipes. The pipes used were 6 in. in diameter, enlarged to 9 in. in diameter near the sewer or manhole. The column of the lamp contained a 6-in. diameter vertical copper tube connected at its lower end with a pipe leading to the manhole, and at the upper end to three incandescent gas burners in the lantern. The lantern was airtight, with the exception of the outlet situated immediately over the burners; the sewer air extracted by the lamp passed through and round the

burners, and was discharged into the open air through the outlet at the top.

The current of air passing from the manhole through the pipe was generally so small that the most sensitive anemometer obtainable, when placed in the end of the pipe, did not record it; therefore the end of the pipe was closed with the exception of the space occupied by the recording instrument, in order to set up a sufficient velocity to enable the instrument to register. A small current of air was thus produced in the 6-in. drain attached to the base of the column, but its effect on the air in even the smaller sewers was practically *nil*, and quite worthless in the case of large sewers. The average quantity of air extracted per lamp was 723·9 cub. ft. per hour.

The amount of coal gas per lamp consumed from June 20 to September 21st was 33,000 cub. ft., at a cost of £3 14s. 3d. At another site the average amount of air drawn from the sewer by this apparatus was about 1,100 cub. ft. per hour.

Prof. Delepine found no evidence of any material dilution of the air in the sewer even close to the ventilating column. When the lamp was not lighted there was an escape of bad-smelling air, but the number of bacteria reaching the lamp outlet was very small. When the gas was lighted, the smell was not noticeable. The temperature of the air at the outlet was so high (exceeding 250 deg. Cent.), that even during a rapid transit it is believed that the bacteria suspended in the air would be destroyed, and this was proved to be so in the case under investigation. The system appeared to be capable of reducing a local smell nuisance without affecting the state of the air in the sewers, and the action of each lamp appeared to be very limited.

Method C consisted of forcing the sewer air, after admixture with fresh air, by a jet pump through clean water, which was supposed to wash it and free it from all impurities. Complaints were received of smells from one of these washing installations, which it was ascertained did not come from defective covers or any points outside the apparatus. Each ejector installation required about 254,000 gallons of water per quarter if worked continuously. The cost for water at Manchester amounted to about £13 13s. per ventilator per quarter.

The proprietors claimed that the sewers would be kept entirely free from sewer air, but this was not justified by the results obtained. Prof. Delepine found that this apparatus did not materially affect the composition of the air contained in the sewer to which it was applied. The air escaping from the outlets at the level of the pavement usually contained about twice as much carbonic acid as the air collected about 5 ft. above the pavement, and distinctly more carbonic acid than the air collected at the level of the pavement. The air also had an unpleasant smell.

Method D consisted of a cylindrical casting containing a cotton-wool filter and disinfectants, and fitted into the manhole shaft, and the inventor claimed that by this method the heat of the sewer air could be made use of to prevent the cotton wool becoming saturated by the condensation of warm, damp sewer air, but the results of the tests would not warrant the general application of the system.

Shortly stated, the investigation of the subject at Manchester showed that the air within the Manchester sewers, situated at a depth exceeding 10 ft. below the surface, generally contained more carbonic acid than the worst street air, and that the proportion of carbonic acid in sewers increases with the depth below the surface and becomes considerable when all openings are closed, a condition more apt to mechanical ventilation. Although a large quantity of carbonic acid can be extracted by mechanical ventilation, a greater proportion was found in the air of sewers that were so ventilated, which may be accounted for by the restriction of free ventilation, a condition indispensable under Methods A, B, C and D.

Prof. Delepine found that the bacteria in the air of the street sewers ventilated in the ordinary way were subject to variations which appear to be due to sudden disturbances of the air, such as steps in sewers, the fall of sewage from inlets above the level of the flow, and condensation on the sewer surfaces exposed to the air.

In order to estimate the influence of sewer air upon health, an elaborate system of experiments has been commenced by Prof. Delepine at the Public Health Laboratory, Manchester, and has not yet been concluded; the results obtained up to the present are, however, extremely interesting and instructive.

TAR AND CEMENT PAVEMENTS IN GERMANY.

Experiments have been made in Bremen and elsewhere with a street pavement composed principally of tar and cement, and which for one reason or other has been baptised "terbacca," which has a familiar sound, not entirely suggestive of street paving.

A test section at the Oldenburg freight station shows, after two years of heavy traffic, but little surface wear and no cracks, although laid on filled ground. The surface layer remains plain and level, and shows less wear than the adjoining sections, which are stone paved on sand bed, and which are more uneven, showing in many places considerable ruts.

The tar-cement pavement is laid on a bed of 5 in. to 6 in. of beton, or over broken stones slicked with cement mortar, say about 2 in. or 3 in. for ordinary streets, ¾ in. to 1½ in. for foot pavements, and 1½ in. to 2 in. for courts. The mixture is made up of ninety volumes of hard, broken stone of three different sizes, ten of gravel and sand, and forty to sixty of Portland cement, mixed dry, then 10 per cent of water is added, and at least five parts of coal tar, thinned down with a solvent. The tar-cement mixture is laid on much more quickly than required finally, and tamped down with a 6-lb. rammer to the required thickness. Where grades are unusually steep more cement is used than on levels.

To prevent the formation of cracks, it is sufficient in ordinary climates to leave openings of ⅛ in. every 40 ft., filling these with asphalt.

In Gothenburg, Sweden, and on the Kaiserstrasse in Hagen, Wesphalia, this pavement has done well; and in the latter city the tar-cement covering is only 7 centimetres (1·78 in.) thick, but a week after its laying it is run over by a steam roller without showing any signs of ill-usage. Here the grade is 1·60. This street shows a smooth, even surface after about eighteen months' use. The Bergstrasse, Elberfeld, on part of which the grade is 1·10, has an equally good appearance after nineteen months' use.

As regards the strength of the mixture for sewer pipes and the like, tests of a five-week-old pipe, 15 cm. (5·8 in.) clear diameter, 27 mm. (1·05 in.) thick, showed that it could carry 130 metric cwt. (14,300 lb.).

In the matter of impermeability, after subjecting plates 1 cm. to 2 cm. (0·394 in. to 0·788 in.) thick to water columns in glass pipes 2 metres to 2½ metres (5·56 ft. to 8·2 ft.) long, for six weeks the under sides of the plates were not wet.—From the *Contract Record* (Toronto).

CREOSOTED WOOD PAVING.

The immense amount of creosoted wood paving laid during the year is said to establish a record in the use of this class of road material, and its suitability for heavy motor traffic is rapidly becoming recognised, according to a statement of the Improved Wood Pavement Company, Limited, of 46 Queen Victoria-street, London, E.C.

A list of a few of the contracts undertaken by the company this year, up to July 1st last, shows that over 239,000 sq. yds. of creosoted deal blocks were laid by them for the authorities of the City and County of London, Birmingham, Chelsea (Chelsea Embankment), Chiswick, Finsbury, Hammersmith, Hampstead, Hove, Kensington, Kingston, Lewisham, Liverpool, Paddington, Richmond, Stoke Newington, Stafford, Westminster (fifteen thoroughfares), Wolverhampton, Wandsworth, Willesden and Wimbledon.

The company recognise that the extension of the loan period has made a very great difference, but they contend that the principal reason for the wider adoption of creosoted deal is its suitability for motor traffic, already referred to.

Rat Plague in France.—Rats are again devastating certain agricultural districts on the eastern frontier of France, and the French Government have made a special grant of £8,000 to be spent on their destruction, which is being effected by the application of Danysz Virus in liquid form, prepared by the Pasteur Institute, Paris, who are at present sending out several hundred quart bottles of Danysz Virus daily. This same preparation can, we understand, be obtained at the Danysz Virus London depot, 52 Leadenhall-street, E.C.

Institution of Municipal and County Engineers.

EASTERN DISTRICT MEETING AT GRAYS.

A pleasant and most profitable time was spent by those who were present at the Eastern District meeting of the Institution of Municipal and County Engineers held on Saturday at Grays. Excellent weather favoured the gathering, and the interesting round of visits at the close of the usual business proceedings took place under the best possible conditions. The meeting opened in the Victoria Hall, High-street, where, in the absence of the chairman, Mr. H. E. Brooks, J.P., Mr. T. N. Banks, vice-chairman of the council, welcomed the members, who included Messrs. H. Percy Boulnois (Westminster), A. T. Bridgewater (East Ham), B. F. Cadle (Gillingham), E. R. Capon (Epsom), S. H. Chambers (Hampton), R. Chart, junr. (Croydon), A. Clark (Croydon), J. Dewhirst (Chelmsford), R. H. Dyer (Southend-on-Sea), E. J. Elford (hon. district secretary, Southend-on-Sea), W. Farrington (Woodford), H. S. Graves (Ashford), G. G. Haman (Gillingham), P. T. Harrison (Chelmsford), A. C. James (Grays), P. G. Killick (Finsbury), C. Lawson (Southgate), H. W. Line (London), R. J. W. Layland (Billericay), J. Liversedge (Leigh-on-Sea), A. J. Mason (Brentwood), E. J. Messent (Southend-on-Sea), T. G. Newcomen (Finchley), W. H. Prescott (Tottenham), A. H. Quick (Thornton Heath), J. L. Redfern (Gillingham), E. J. Reynolds (Friern Barnet), J. E. Sharpe (Cheshunt), L. J. Small (Woodford), C. Chambers-Smith (Westminster), J. P. Spencer (Tynemouth), F. W. Wale (Wealdstone), H. T. Wakelam (Middlesex), H. Walker (Wealdstone), H. C. Whitehead (Southend-on-Sea), H. F. Wilkinson (Tottenham), E. Willis (Chiswick) and O. E. Winter (Hampstead).

Mr. R. J. THOMAS (Buckinghamshire), the president, occupied the chair.

In his address of welcome to the members Mr T. N. BANKS, the vice-chairman of the council, said he was afraid there was little in Grays to boast of. The industries which had been carried on there for many years past had deprived the district of much of its former beauty. They must be content, therefore, with seeing what remained.

The PRESIDENT (Mr. R. J. Thomas) said it was his pleasant duty to propose a hearty vote of thanks to the vice-chairman of the council for his reception of the institution. It was always a pleasure for officials to examine the work of their *confrères* in other towns, and in the case of municipal engineers particularly they were able to learn much more from such inspections than from the mere reading of papers descriptive of undertakings in which they were interested. He felt sure that they would see many things to admire and profit by during their stay in Grays.

Mr. E. WILLIS (Chiswick) seconded the proposition.

The vote of thanks was carried with acclamation. Mr. Banks making a brief acknowledgment of the compliment.

ELECTION OF DISTRICT EXECUTIVE COMMITTEE.

The minutes of the last Eastern District meeting, held at Lowestoft, having been read and confirmed, the matter of the formation of a district executive committee was introduced by the hon. district secretary, Mr. E. J. Elford.

At the outset a protest was entered by Mr. R. CROOME (Cromer) against considering the appointment of the committee at a meeting of that kind.

The PRESIDENT said he presumed the correct course was for representatives of the district only to take part in the proceedings.

Mr. H. T. WAKELAM (Middlesex) expressed the view that, as the meeting had been called for the purpose in question, they should proceed with the business.

Mr. S. H. CHAMBERS (Hampton) contended that, in view of the small number of local representatives present, they were hardly properly constituted for the purpose. He moved that the matter be adjourned.

Mr. ELFORD questioned whether anything would be gained by that. They wanted the committee, and it was to be hoped that the meeting would proceed to its election. If they called a special meeting at the [illegible] they might be asked [illegible] At any rate, they had [illegible] Let us get on with our business.

Mr. H. PERCY BOULNOIS (Westminster) said he supported Mr. Elford. They were met for a specific purpose, and he saw no reason for delay.

On being put to the vote the motion was lost, and the meeting, without further discussion, elected the following to act as the district executive committee—*viz.*, Messrs. C. Brown (Edmonton), S. H. Chambers (Hampton), A. E. Collins (Norwich), A. Gladwell (Eton), P. T. Harrison (Chelmsford), W. H. Prescott (Tottenham), J. E. Sharp (Cheshunt), C. Vawser (New Barnet), E. Willis (Chiswick), H. Collins (Norwich), W. R. Hicks (Ealing), and F. Wilkinson (Wimbledon), the three last-named being deputy engineers in their respective towns.

The following paper next came before the meeting for discussion:—

THE MUNICIPAL WORKS OF GRAYS.

By ARTHUR C. JAMES, ASSOC.M.INST.C.E.,
Surveyor to the Urban District Council.

[Mr. James is a native of Malvern, and was educated at the local grammar-school. He was articled to Mr. G. Eastlake Thoms, M.I.C.E., borough engineer of Wolverhampton, and on the latter's resignation remained a few months under his successor, Mr. R. E. W. Berrington, M.I.C.E. He was assistant borough surveyor at Cambridge from 1887 to 1893, under Mr. J. T. Wood, M.I.C.E., and the late Mr. E. W. Harry, and took part in the preparation of the scheme of drainage for the borough carried out by Mr. Wood. Mr. James has occupied his present post since September, 1893, and has carried out various municipal works in the town of the value of about £100,000.]

The history of Grays Thurrock goes back for many centuries. Its name, Thurrock, is a corruption of Thor's Oak, reminiscent of a druidical worship under the oak trees of the neighbourhood. Harold, the last of the Saxon kings, was Lord of the Manor of the middle part of Thurrock. Grays, the name by which the town is now known, except for official purposes, was added by the grant of the manor of Thurrock to Henry de Grey by Richard I. in 1194, the grant being confirmed by John in 1199. The original grants are still in existence, and facsimile copies are hung in the free library.

The municipal history of the district dates from 1886, when the local board was formed. Before the construction of Tilbury Docks, Grays was little more than a riverside port for the conveyance of agricultural and other produce to and from the surrounding countryside. There were also extensive chalk quarries and, later, the cement industry found employment for a considerable number of men. The docks were commenced in 1882, and opened in 1886, and the population increased from 5,327 at the census of 1881 to 11,199 in 1891, the town becoming the residential and shopping centre of the district. At the census of 1911 the population was 15,998, and the rateable value is £51,062, or only £3 3s. 10d. per head of the population. When the low rateable value per head, and the fact that the district is a new one, in which the needs of modern urban life have had to be provided for within the last twenty years, so that few of the loans have yet fallen in, are considered, it is not surprising that the general district rate is 4s. 4d. in the £. The poverty of the place has permitted little expenditure except for necessaries, but the author trusts that members may find something of interest in the following brief description of the work which has been carried out.

The district is approximately 2¼ miles from north to south, 1¼ miles in width, and the land area is 1,382 acres. The levels range from 6 ft. above ordnance datum in the south, to 115 ft. above ordnance datum in the north-west. The low-lying land adjoining the Thames is alluvium, and much of it is below high-water level, being protected by the river-wall, for which the Essex Sewers Commissioners are responsible. The higher ground consists chiefly of gravel beds overlying the chalk. The death-rate for 1911 was 10·7 per 1,000, only three deaths being attributable to infectious disease.

SEWERAGE AND SEWAGE DISPOSAL.

The first task of the local board was the provision of a system of sewerage, the town then being entirely drained into cesspools which were not watertight. Designs for schemes were invited and that of Mr. W. H. Radford, ASSOC.M.INST.C.E., of Nottingham, was selected. Work was commenced in August 1892, and the disposal works were brought into use in November, 1894, the cost being £12,000. The scheme is designed on the partially separate system, all rain water from streets and front roofs being taken by surface-water

drains to four main outfalls. The sewers are laid chiefly in the back roads, with which all streets are provided, and receive all yard and back-roof drainage, in addition to the sewage proper. A system of ventilation by means of columns 30 ft. and 40 ft. high was installed in 1902. The disposal works are placed on the marsh land in the southern part of the district, where all the sewage is pumped and treated. The sewage from Chadwell St. Mary (now the recently formed urban district of Tilbury) and Little Thurrock, two parishes in the Orsett rural district, also drains to the works, being pumped and treated by the Grays Council under agreement. The average daily flow to the works last year was 238,000 gallons from Grays, and 233,000 gallons from Tilbury and Little Thurrock. The dry-weather flow from Grays is about 11 gallons per head.

Originally the works were designed for the treatment of the sewage by chemical precipitation, but in 1902 the precipitation tanks were converted into septic tanks, and new bacteria beds constructed at a cost of £4,500. The original tanks cracked considerably owing to bad foundations; the walls and floors of the new beds were therefore reinforced with old railway metals, and no cracking has been experienced.

The works do not present any features of special interest. Daily records of the quantities of sewage pumped have been kept since the works were opened, and some years ago the author had occasion to extract details of the daily flow over a period of eleven years, particulars of which may be found useful, as they bear upon the requirements of the Local Government Board for new works. It was found that the increase in the dry-weather flow due to rainfall was as follows:—

Exceeding once, but not exceeding	1¼	times the D.W.F.,	562	times.
,,	1¼	times	,,	,,	2	,,	,,	125	,,
,,	2	,,	,,	,,	3	,,	,,	43	,,
,,	3	,,	,,	,,	3½	,,	,,	8	,,
,,	3½	,,	,,	,,	4	,,	,,	once.	
,,	4	,,	,,	,,	4½	,,	,,	once.	
,,	4½	,,	,,	,,	5	,,	,,	once.	
,,	5	,,	...	...	...	...	...	never.	

It will be seen that the total daily flow exceeded twice the dry-weather flow only on fifty-four occasions in eleven years.

For some years there has been a proposal before the district for the provision of a joint outfall sewer for West Thurrock and Stifford, to the west of Grays, as well as the three parishes now using the Grays works, with new disposal works below Tilbury. A Provisional Order forming a joint sewerage board for this purpose has recently received Parliamentary approval.

SURFACE-WATER DRAINAGE.

Owing to the low level of portions of the district the disposal of surface water is an expensive matter. For one portion of the town a tank to contain the rain falling at high water had to be provided, its contents being discharged to the river at about half-tide. The centre of the town, which drains to a tidal ditch, was subject to considerable flooding, and a new 30-in. drain was constructed in 1904, at a cost of £3,550, by which a large part of the drainage was diverted from that outfall. This proved still to be insufficient, and recently further works were undertaken, at a cost of £2,230, which included the provision of electrically driven centrifugal pumps to discharge the flow direct to the river at high tide. The rising main from the pumps is about a ¼ mile long, and is constructed of Siegwarts' reinforced concrete pipes. The author has lately presented a report upon flooding in other parts of the town, recommending certain works, estimated to cost £4,100, pumping being necessary at two outfalls.

SCAVENGING AND HOUSE REFUSE COLLECTION.

About 9 miles of streets are regularly scavenged either daily or two or three times weekly as required, and the main shopping streets are swept twice daily. The sweepings are taken to a farm in the district, but, since the advent of surface tarring, the farmer finds they are useless as manure. The annual expenditure is about £670. Formerly the house refuse was carted to any convenient tip, but in 1901 a destructor was provided in connection with the electric lighting station then being built. The plant consists of a Meldrum Simplex twin cell and Lancashire boiler, the steam being utilised by the electricity department. The destructor is placed in the centre of the district, 300 yds. from the council offices, and the cost was £3,284, including fencing the land and heavy foundations necessitated by the character of the site. The refuse is collected once weekly in covered carts containing 2½ cub. yds., and the cost is 3s. per load, or 3s. 6d. per house per annum. Trade refuse is not collected, but is received and burnt free of charge. The clinker has been largely used for making up back roads and other purposes, and finds a ready sale at 1s. per load, the income from this and from the sale of old tins being about £60 per annum.

PARKS.

In 1898 the council purchased 8¾ acres of land in the centre of the district, at a cost of £2,100. Of this 1½ acres were set apart for a depot, and the balance laid out as a public recreation ground. Stabling, &c., was at the same time erected in the depot, the total expenditure on the scheme being £3,400. Further buildings have since been erected, at a cost of £850. Though small, the park forms a useful open space, which would otherwise undoubtedly have been occupied by cottages ere this. Attention may be called to the use of concrete in the boundary walls where appearance is not material. This wall, 6 ft. 6 in. high, cost only 8s. 6d. per yard, including foundations, and there has been no expense for maintenance. Ivy is planted against the wall, forming a good background for the gardens and shrubs.

In 1903 the council purchased 4¾ acres of land adjoining the river Thames for £1,880, and the owner gave 1 acre as a memorial of the coronation of King Edward VII. The land is situated on both sides of the river wall, and the part next the river has been filled up and covered with Thames ballast and sand to form a beach, and the ground is known as "The Beach." This was not done, as was widely assumed at the time, with the idea of making Grays a seaside place, but as an economical method of rendering useful land which is covered by the river at spring tides. It is much appreciated by the children of the neighbourhood, who make use of it in large numbers during the summer. On the land side of the river wall, which is about 8 ft. lower than the wall, it was proposed to construct a model yachting pond, and the plans also provided for an enclosed open-air swimming bath. The Local Government Board declined, however, to sanction a loan for the latter. When work was begun, the Sewers Commissioners issued an order for the river wall to be raised 18 in., and it was therefore determined to deepen the pond in order to provide the necessary soil for raising the wall, and at the same time make the pond available for swimming. Water is supplied to and removed from the pond at spring tides by a 21-in. pipe communicating with the river by way of the surface-water storage tank above referred to. The cost of a special communication with the river was thus avoided. Although the bottom was only of mud, the bathing proved such an attraction that in the autumn of 1905. It was decided to deepen the pond, line it with concrete, erect dressing sheds, and provide a well and pump to supply fresh water. The concrete bottom is only 6 in. thick, and is reinforced with wire netting. The walls round the pond are of the same thickness, reinforced with wire. The pond is 90 yds. long by 50 yds. wide. It is 1 ft. 9 in. deep at the sides, sloping towards the centre, where there is a portion, 70 ft. by 30 ft. in front of the diving stage, which is from 6 ft. 6 in. to 6 ft. 9 in. deep. A refreshment kiosk was at the same time built, the shop being at the level of the river wall, while beneath it are a store for model yachts and conveniences for both sexes. Altogether £4,500 has been spent on this work. The pond is open for bathing daily during the summer months, from 6 a.m. to 9 a.m., and from 6 p.m. till sunset, at a charge of 1d., and 2d. is charged for a private dressing box. Ladies are admitted free from 9 to 11 daily, and boys of school age from 9 till noon on Saturdays. On other days the boys from the elementary schools have the use of the pond for swimming instruction.

CEMETERIES.

The council act as the Burial Board, and possess two cemeteries, one adjoining the church in the town and the other in the parish of Little Thurrock, about 1½ miles distant. This was purchased and laid out thirty years ago. In 1900 the council purchased 7½ acres of land adjoining the Little Thurrock cemetery for the purpose of extension, and this has been fenced and partially laid out to find work for unemployed. The fence consists of about ¼ mile of concrete wall similar to that at the park, but rendered on the outside, where [illegible] a public road.

WORKMEN'S DWELLINGS.

In 1901 twenty-five cottages were erected in Parker-road. The cottages [illegible] parlour, kitchen, scullery,

larder, and three bedrooms, and the contract price was £5,250. The cost of the land was £272, and that of roads and sewers £206 10s. The cottages were first let at 8s. per week, afterwards reduced to 7s. 6d., and again, three years ago, when many of the houses in the town were empty, to 6s. 6d. At 7s. 6d. per week the houses might pay their way, but at 6s. 6d. this is impossible, and there is a considerable debit balance on the account.

LIGHTING.

An electric lighting scheme for the district was carried out in 1901 by Messrs. Preece & Cardew, and since its completion in October of that year the town has been entirely lighted by electricity. There are 284 public lamps, the candle power ranging from 50 to 400, with an average of 70-candle power. The price of current for public lighting last year averaged 3·1d. per unit. For private lighting the price of current is from 4½d. to 3d., according to the quantity consumed, the average price received being 3¾d. For power the charge is 2½d. per unit, and motors equivalent to 294-horse power are supplied. The undertaking makes a small nett profit, after payment of all charges.

HIGHWAYS.

The main roads of the district are 2 miles 7 furlongs in length, and are maintained by the council, contracts being entered into from time to time with the county council for periods of five years. The annual sums paid have been: 1896-1906, £1,140; 1906-1911, £900; current contract, £950. For special improvements extra payments are made. It will be seen that the large increase in the cost of maintenance which has been experienced elsewhere, owing to the advent of motor traffic, has not obtained here, although there is a very considerable motor traffic, both heavy and light, through the district between London and Southend, and to Tilbury Docks.

Some 5½ miles of private streets have been made up during the author's term of office, the specification being as follows: –

Carriageways.—9-in. chalk flint foundation and 4-in. hand-broken chalk flint surface.

Footways.—*In situ* concrete, composed of 3-in. Thames ballast concrete, faced with 1-in. granite concrete (cost 3s. per square yard).

Kerbs.—Straight, 12-in. by 8-in. concrete, similar to the footway, formed *in situ* (cost 1s. 6d. per yard); circular, 12-in. by 8-in. granite.

Channels and Crossings.—Formerly of granite setts on concrete, but latterly of scoriæ bricks.

The price of flints has largely increased of late, and on the last streets made up the carriageway construction was varied to 4-in. destructor clinker, 6-in. flints, and 3-in. granite macadam, without extra cost. Most of the streets in the district are 40 ft. wide, and the average cost is about 10s. 6d. per foot of frontage. Formerly, none of the streets were channelled, but the author persuaded the council to include this work when the first batch of private streets was taken in hand. It was afterwards decided to channel all the existing roads. In all, 11¼ miles of kerbs, 17¾ miles of channels, and 9½ acres of footway paving have been laid down since the author's appointment. Very considerable improvements have been effected to existing roads, some 2 acres of land having been added to the highways. Advantage was taken of the opportunity when widening a road to strengthen the foundation of the road dealt with over its total width, and it is to this that the fact that maintenance costs have not increased is in large measure to be attributed. For many years granite chippings have been used in binding road surfaces, and it is the practice when re-scarifying a road to remove all the small scarified material, which, when sifted, is used for repairs in streets of less traffic, and for patching.

Surface tarring was first tried experimentally in 1905, and since 1906 all streets have been tarred annually without any addition to the total expenditure. The cost of watering has been reduced from £240 per annum to an average of £80, while the quantity of mud removed during the winter and the contents of street gullies has decreased 45 per cent. It is certain that both of these items would have been largely increased as a consequence of the motor traffic, had not this or some similar treatment been adopted. Crude tar has for several years been applied by machine at a cost of 0·42d. per square yard, with tar at 2d. per gallon, sand 2s. 6d. per yard at the pit, horse hire 8s. per day, and labour 6d. per hour. This cost includes the special preliminary scavenging and foreman's wages. This year dehydrated tar at 2½d. per gallon has been used, while horse hire has risen to 9s. per day, and labour to 7d. per hour. Several lengths of macadam grouted with bituminous material have been laid down, the following materials having been used: crude tar, tar and pitch, roadoleum, natural asphalt matrix, asphaltmac and camarco. Until the last two years 1½-in. macadam has been employed, it being found to give a smoother surface than larger stone, and to minimise the wheel friction, with the result that less dust is created. With the advent of heavy motor traction 2-in. stone has been substituted on the roads of heaviest traffic, but the author is of opinion that with bituminous binders 1½-in. material is preferable.

While dealing with the subject of highways the author would like to emphasise the importance of standardising materials, especially macadam. Samples sent with tenders are generally well broken, and of the specified sizes, but, to judge by the character of subsequent deliveries, must sometimes have taken a considerable time to find. Having had to reject a good many cargoes of stone on account of bad breaking the author knows from experience how difficult it is to convince some contractors that when "cubically broken" stone is specified it is of any consequence that it should be supplied. The rejection of a ship's cargo of 200 tons is a serious matter both for the contractor and the council, and it is sincerely to be hoped that practical good may result from the efforts of the Standardisation Committee of the Institution in this direction.

CONCLUSION.

The whole of the works above described, with the exception of the sewerage scheme as originally designed and the electric lighting scheme, have been designed and carried out under the author's supervision by the direct employment of labour, contractors only being employed for the erection of buildings.

The fire station in Orsett-road was designed by the author's predecessor, the late Mr. Chas. Cobham, F.S.I., and erected in 1892 at a cost of £1,500. The free library in Orsett-road was built in 1903 at a cost of £3,000, provided by Mr. Andrew Carnegie, from the designs of Mr. C. M. Shiner, A.R.I.B.A., of Grays.

DISCUSSION OF MR. JAMES' PAPER.

Mr. H. Percy Boulnois (Westminster) congratulated Mr. James on his paper, which was concise and quite to the point. It gave an admirable epitome of the work which Mr. James had carried out. The table with regard to the flow of sewage in the district he regarded as exceedingly valuable, and he hoped that every surveyor in the country would follow the example of Mr. James and prepare similar tables. The Local Government Board only had overflows put in the sewers when six times the dry-weather flow had been reached, but the return showed that at Grays that had never happened; five times had only been reached once, and four and a-half and four only once each. That was the sort of information they wanted, and it would be useful if the practice of obtaining it could be extended to other towns. It was very difficult, of course, to criticise the paper until one had seen the various works which it described, and he threw out the suggestion that members might after their tour of inspection communicate by letter with Mr. James in regard to any point on which they desired to be enlightened. He had pleasure in proposing a vote of thanks to the writer of the paper.

Mr. E. Willis (Chiswick) seconded. In regard to the levels of the district, he did not think all of them were aware that any part of the district was as much as 115 ft. above ordnance datum. He thought that was very fortunate for the district, because they were gradually reducing these levels in the chalk hills. In connection with the surface-water drainage, he would like to know whether Mr. James had had any serious difficulty with flooding; he knew there had been some, but it was not stated whether it had been serious. He had the tide running up the centre of his district, and had had to carry it away by the sewer. Vans of a capacity of 2½ cub. yds. were used in the collection of house refuse, and he would like to know whether these had proved economical. He himself had started with vans of 3 cub. yds. capacity, and had gone up to 6 cub. yds. But his district was very flat, which accounted for his being able to use such large vans, and they had been able steadily to reduce the cost of collection in spite of the increasing population, and without any apparent additional wear and tear on the horses. On the matter of highways he congratulated the author on the fact

that although the traffic had developed so much in recent years the current contract for maintenance was lower than in 1906. That seemed remarkably good. Some information appeared to be required as to the *in situ* concrete footpaths. He had had trouble in effecting repairs where there were any trenches underneath, and he would like to know whether Mr. James had experienced similar trouble. Then as to the wear of concrete kerbs he had had no personal experience with them, but if they really did wear well they might be worth considering. They were told in the paper that the cost of watering had been very considerably reduced since the adoption of surface tarring. He did not know whether that had been the universal experience of the members of the institution; at any rate it was not his. He had tarred between one-third and one-half of the roads in his district, and the watering had not been reduced very much. Residents did not seem to like roads that had not been watered. Perhaps other members would give their experience?

Mr. E. R. Capon (Epsom) said he noticed that the paper did not state what area was covered per gallon of tar. The work was done at a very low price, so low, in fact, that he could not touch it by a penny, his price being from 1¼d. to 1⅜d. per square yard. Some information on the point he had mentioned seemed desirable. The Grays carriageways were constructed with only 4 in. of flint surface. He would like to know how these had lasted, and have some information also as to the concrete kerbs.

Mr. E. J. Elford (Southend-on-Sea) said he was sure the council of the institution would appreciate the way in which Mr. James' paper had been written. If all papers were written in the same concise, business-like way the printing bill of the institution would be very much reduced, and he did not think they would lose much in the usefulness of the papers. Mr. James' contribution gave one the impression that he had done his work very well and economically. There was not the scope in Grays that there was in larger districts, but what he had done he appeared to have done most capably. Proceeding, Mr. Elford said he would like to know the weight of the 6 cub. yd. vans referred to by Mr. Willis.

Mr. Willis: The tare is just over a ton.

Mr. Elford: That is an exceedingly low tare. The cost of house refuse collection in Grays was very economical. The plans for the open-air swimming bath were not approved by the Local Government Board, and it would be interesting to know the reason for that. A sum of £4,500 was spent on the refreshment kiosk, a store for model yachts, conveniences and baths. Had that been paid for out of loan or revenue? The fact that a profit was being made out of the electric light undertaking was very creditable in the case of so small an undertaking. Mr. James had not yet commenced to use tar-macadam or other similar material for private street works, but he would have to come to it, and the cost would not be much greater. The use of 1½-in. macadam on the majority of roads and 2-in. stone on the heavier traffic roads was mentioned, but personally he favoured 1½-in. stone for all situations, a road made up of good 1½-in. material being much more satisfactory than one constructed with larger material.

Mr. S. H. Chambers (Hampton), in adding his thanks to the author, asked what was the water supply per head in the district. A sewage flow of 11 gallons per head was an abnormally low one, and he did not think there were many places in the country where the quantity was so small. It was interesting to see the particulars of flows given, but he thought it must be a very dry neighbourhood, considering that the average flow was some 15 gallons per head per day. As to the cost of watering, he asked whether Mr. James had to pay for the cost of the meters.

Mr. H. T. Wakelam (Middlesex) said he also wished to thank the reader of the paper for presenting such a valuable document. Having watched the growth of the district under Mr. James' administration, and followed his career for several years past, he could testify to his engineering abilities.

Mr. C. Lawson (Sandgate) put a question as to the cost per annum of the electric lighting, and the number of hours during which the lamps were burning.

Mr. P. T. Harrison (Chelmsford) said the information given in the paper was so concise that he did not think he could touch upon any point except the stables. He was particularly interested in that class of work, and would like to know the cost per horse, and to have any figures with regard to the cost of the stables separately from the depot buildings.

The President, in putting the vote of thanks, referred briefly to one or two points in the paper. In the first place he wished to echo the remarks of one of the speakers as regarded the cheapness of the surface tarring done in Grays. One halfpenny per square yard was a very low price, and it would, he agreed, be interesting to know the area over which a given quantity of tar was distributed. Figures as to the average rainfall might usefully be included in the paper. He himself had found concrete kerbs fairly satisfactory. At times they chipped, but they were true in line, and were very economical. The paragraph with reference to the standardisation of materials was interesting. Standardisation was one of the most crying needs of the day, particularly in connection with road materials. At present they had all sorts and kinds of stone labelled as granite, and to a young officer not conversant with the quarries from which the materials were derived it was confusing. He quite believed the efforts of the Standards Committee would result in their obtaining considerable assistance in that direction.

The vote of thanks was passed.

Mr. James, in reply, expressed regret that there was not more in the town to show the members. They were very poor, and everything had to be done as economically as possible, though they had tried to do the work so that it would not require to be done over again. The surface-water drainage flooding referred to in the paper was due to rainfall, and not to the breaking of the river wall. They had had one break of that kind, however, when they had to stop pumping altogether. In June last they had 2½ in. of rain in an hour, and they suffered from flooding in consequence in the low-lying part of the town, one building—a chapel—having as much as 3 ft. of water in it. But such a thing did not often happen. With regard to dust collection, at present they used carts, and if one day they scrapped these they might go in for vans, though not of a capacity of 6 cub. yds. For one thing, they would have considerable difficulty in manipulating the vans in the back streets. They had received £1,500 a year from the county council. The reason for the lower cost of the main roads was entirely that which he had given in the paper. They had widened the roads and taken the opportunity to put in a good foundation. The tarring of the roads had also a considerable effect in increasing their life. The area of the roads was about double what it was fifteen or sixteen years ago, and the cost was just about the same. They did not have trouble with the trenches underneath the concrete footpaths. They had a bar from 6 ft. to 10 ft. long, with a special loose cast-steel head, which they drove under the paths, and threaded either a cable or water or gas pipe through to the premises. They only had to break up a path if it was more than 8 ft. wide, and then they cut open the path to a regular size and kept slabs made ready for repair at once. They began the tarring very early, commencing on April 2nd and finishing by the middle of May. If one put the work off until June one could effect no saving in the matter of watering. Seven square yards had been covered with each gallon of tar, and with dehydrated tar 6 sq. yds. The price was ·55d. They did not know why the swimming bath was omitted from the loan, but perhaps because it was thought they were too extravagant. The £4,500 was for building and everything except the fencing. They had not used tar-macadam on private streets, but the last one or two streets they tar sprayed, practically without any addition to the cost of water binding. It was too early to say whether it would stand. There were several pieces of bituminous-grouted road. The water supply per head he was afraid he could not give. Practically the district was without any baths at all. He was told that in the mining districts in the North of England the flow at the sewage works was the same as at Grays. The sewers were absolutely watertight. After they were laid the sewers were lying empty for several months, and he was not able to trace any leakage into them, although they were laid in low and marshy ground. The rainfall was about 19 in. per annum. He knew only of Shoeburyness being drier than they were. The water meters belonged to the council. The water company used to charge them 27s. rent. It was about £70 the water company wanted for them second-hand before they bought them. They had then paid £53 in rent. Last winter they had Tantalum lamps in the streets, the lanterns holding two 25 c.p. lamps. For these they had sub-

stituted one Osram lamp, with the result that they were saving £150 a year. He was afraid he could not separate the cost of the stables from the other work. The concrete kerbs were adopted sixteen years ago, at the suggestion of the father of the chairman of the council, who had seen it in Philadelphia. It was laid down against his (the speaker's) wishes, but he was now convinced that it was perfectly good for any purpose. He did not say it was good for heavy traffic, but he had seen it opposite the Waverley Station, Edinburgh, and in St. George's-square, Glasgow.

An inspection of the "Beach" Recreation Ground and open-air swimming pond, and the new infants' school and school baths in Bridge-road, was afterwards made by the members, following which the party were driven to the Wouldham Cement Works. Luncheon was provided on arrival, the hospitality of the company being acknowledged on behalf of the members by the president of the institution (Mr. R. J. Thomas). In the subsequent tour of the works the members were shown the various processes of manufacture, which were followed with the greatest interest by all present. Later in the afternoon the manufacture and testing of reinforced concrete pipes were witnessed at the works of Messrs. Siegwart, Limited.

AN EXTENSIVE WATERWORKS FILTRATION SCHEME.

Situated between the Wessenden Valley reservoirs of the Huddersfield Corporation and the Woodhead reservoirs of the Manchester Corporation is the watershed of the Ashton, Stalybridge, Mossley and Dukinfield Joint Waterworks Board. In the valleys at Greenfield, Chew and Swineshaw are seven or eight large reservoirs, which supply water to a population of 140,000 people, distributed over an area of 52 square miles. For some years complaints of lead poisoning were prevalent in the Yorkshire part of the board's area, and in order to remedy this the board decided to undertake a scheme of filtration.

This work has been carried out, at a cost of £80,000, and last week the filtration stations at Greenfield, Saddleworth and Swineshaw—among the largest of their type in the kingdom—were officially opened. The two installations comprise thirty-six pressure filters, designed to purify collectively 5,352,000 gallons of water per day. The filters and the chemical plant have been supplied and erected by Messrs. Mather & Platt, Limited, of Manchester. Practically the whole of the power in the filter-houses is generated by water.

Cheshire Sanatorium Scheme.—The Chester Town Council have approved of a scheme under the Insurance Act for a joint sanatorium district for the county of Cheshire and the county boroughs of Chester, Birkenhead, Stockport and Stoke-on-Trent and the borough of Wallasey. It is proposed to build a sanatorium for 150 beds at a cost of £25,000.

Street Dust and Street Pavements.—In a recent article published in *Hygiene* Dr. Rasser draws attention to the considerable danger connected with street dust, the action of which on the human organs of respiration is responsible to a great extent for the origin of tuberculosis and similar diseases of the lungs and wind-pipe. But, apart from this kind of trouble, dangerous chronic inflammations of the eye should be put down to the action of street dust. In fact, an increase in the frequency of catarrhs has been observed with continued dry weather and a reduction on the occurrence of the first rain. Under these conditions road engineering, apart from its technical task, has primarily to fulfil a sanitary task. As the production of dust depends on the fixing of roads, a pavement complying with all hygienical requirements should be looked for. Asphalted streets would seem to comply with most of these conditions, provided there be an extensive and thorough removal of waste matter followed by an abundant sprinkling of the road surface. Granitchrome pavement, as used with especially satisfactory results in London, would seem to be most desirable. Dr. Rasser does not seem to think very highly of the sprinkling of roads with chemicals, such as salts and tar. An ideal means of laying street dust which has been suggested of late years is sprinkling with a solution of sulphite pitch in water, which would seem to avoid any dust for at least six weeks. Sulphite pitch is obtained as a by-product in manufacturing cellulose.—*Scientific American.*

TOWN PLANNING: THE PRELIMINARY SURVEY.

To the Editor of The Surveyor.

Sir,—In your issue of September 20th you note the reference of Prof. Geddes, University College, Dundee, to the necessity of a survey being made before the preparations of any town-planning scheme can be satisfactorily undertaken. We found it advisable at Letchworth to have the whole estate of 4,000 acres odd contoured for every 5 ft. difference of level. From this we were able at once to see the main line for the sewers and position of sewage farm, and obtain other necessary information.

Having had charge from the commencement of the engineering work at Letchworth, I should like to emphasise Prof. Geddes' warning. It is impossible to make an economical plan without a careful survey. In my opinion at present too much consideration is given to the bird's eye view of town plans (the result of which can only be seen from a flying machine when the place is built). The drainage should determine the roads rather than the roads the drainage. —Yours, &c.,

A. W. E. Bullmore, Assoc.M.Inst.C.E.

Estate Office,
Letchworth, Herts.

IS THE ROAD BOARD A FAILURE?

To the Editor of The Surveyor.

Sir,—As I notice you are inviting correspondence on this subject, it is my opinion that if the Road Board has not yet had time to prove itself a failure, there is no doubt that this will be its end.

In the article you refer to it is said they have "splashed tar about," and this has apparently been done quite freely.

There is also another material that they appear to favour, although it has no particular advantage with the exception that it belongs to contractors who, I believe, are closely connected with the Government.

To make better roads, or to know how to make them, it is necessary to have some knowledge of the materials being used, and it will be interesting to hear other views on this subject.—Yours, &c.,

Practical.

September 24, 1912.

[With deference to our correspondent we suggest he has misinterpreted our invitation. A general statement that the Road Board appears to favour a material which is supplied by contractors who are closely "connected with the Government" is neither convincing nor helpful. Does our correspondent suggest that the Board's Advisory Committee are parties to this unholy partiality? On this minor point we think it can be accepted that the Road Board make their grants solely on their unprejudiced judgment as to the merit of the specific work under consideration. The important broad issue is this: The board has at its disposition a certain revenue for the stimulation and encouragement of roads improvement. Does it disburse this income on right lines? If not, how could it improve upon its methods?—Ed., Surveyor.]

Standard Pipe Specifications.—We have been favoured by the British Engineering Standards Committee with copies of the newly issued standard specifications for cast-iron pipes and fittings. The specifications, which are obtainable at the price of 5s. each, are two in number, one relating to pipes and fittings intended for soil, and a separate one dealing with pipes and fittings for other purposes. It is hardly necessary to say that the specifications are most carefully drawn, and are complete in every particular. Each deals separately, as far as drawings and dimensions are concerned, with straight pipes, bends, inspection doors, double sockets and holder bats. A large scale drawing is given of each pipe or fitting, and the standard dimensions are indicated by means of letters corresponding to the required dimensions in tables applicable to pipes of varying sizes. These standard specifications will be indispensable to all users of cast-iron pipes for any purpose, and it affords us pleasure to call the attention of our readers to their publication.

New School at Chiswick.

DETAILS OF CONSTRUCTION.

The Chiswick Urban District Council have erected at Strand-on-the-Green a boys' school, the design of which embodies a number of interesting features, and which in point of cost compares favourably with other buildings of a similar class in the metropolitan area.

SITE.

About 2,800 sq. yds. of site have been covered, the school occupying about 440 sq. yds. The playground has been raised and tar paved for an area of 1,850 sq. yds., and about 510 sq. yds. has been left for the boys' gardens.

The whole area has been enclosed by solid unclimbable iron railings, but double gates have been fixed for the admission of the fire-escape should it be required. The existing southern gate will form the main entrance for boys. The covered playground at present forms part of the school, but should it be required for open-air classes, an additional covered playground at ground level may be added.

DRAINAGE.

The whole area is drained by gullies only at the sides into the storm-water drainage system, thus leaving an even and unbroken surface for games. The heating chamber and coal store, which forms the only basement, is provided with a fixed semi-rotary pump for lifting all waste or rain water to the general drainage level.

Lavatories are provided in the head master's room (for use during medical examination), and in the cloak-rooms, on mazzanine and ground floors, these

discharging into the foul-water sewer in Brook-road. One masters' and two additional boys' water-closets have been provided with dials worked by the same master clock in the head master's room.

Strand-on-the-Green School, Chiswick.

Corner of Covered Playground, Strand-on-the-Green School.

have been provided with extra urinal accommodation, while three "Purita" fountains placed outside the school provide a continuous supply of drinking water.

STRUCTURE.

The walls are of stock bricks, with red brick dressings and blue brick plinth, all below the damp-proof course being in cement mortar. The roof is of wood construction covered with boarding, felt and best Broseley tiling.

The internal surface of the walls to the staircase is finished with brown salt-glazed brick facings, this material also forming a dado 4 ft. high on both floors, the remaining surface being distempered. The thresholds and steps are of York stone, while the window cills are made with blue brick blocks, and the arches of rubbed brick, with Portland keystones. Bull-nozed angles are provided both externally and internally at all projecting angles.

The windows in all walls are formed with steel casements, with hopper openings for the prevention of draught and better ventilation. This type also gives a maximum amount of light for the size of the opening. The borrowed lights are similarly of steel construction, and are made to open for ventilation.

The internal joinery to the classrooms is in pitch pine throughout, with yellow deal for the cloakrooms and lavatories.

The floors to the classrooms are of steel and concrete, finished with 1½-in. pitch pine blocks laid to herring-bone pattern, while the staircase is ferro-concrete, and the cloak-rooms and corridors are all finished with granolithic paving. Blue brick paving is adopted in the basement.

VENTILATION, HEATING AND LIGHTING.

In addition to the ordinary windows extra ventilators are provided to all classrooms, four opening direct into the external air, and four discharging through a ventilating turret about 40 ft. high. Fanlights are fixed to the classroom doors, and at all times cross-ventilation in either direction is possible.

The heating of classrooms, lavatories and corridors is effected by a low-pressure system, regulated automatically with a sectional boiler in the basement and radiators in all classrooms, the master's and assistant masters' rooms being warmed by open fires.

The artificial lighting throughout is by means of gas, inverted incandescent mantles being used in the classrooms and plain guarded burners in the corridors.

FITTINGS.

All rooms are provided with the Magneta Time Company's clocks, and [illegible] the "Metrical" [illegible]

A special pendulum fire alarm and telephone is fixed in the ground-floor corridor at the foot of the staircase, this ringing direct to the fire station. The

Strand-on-the-Green School, Chiswick.

turret, chimney stacks, and so forth are properly protected by lightning conductors connected to a copper earth-plate on the southern side.

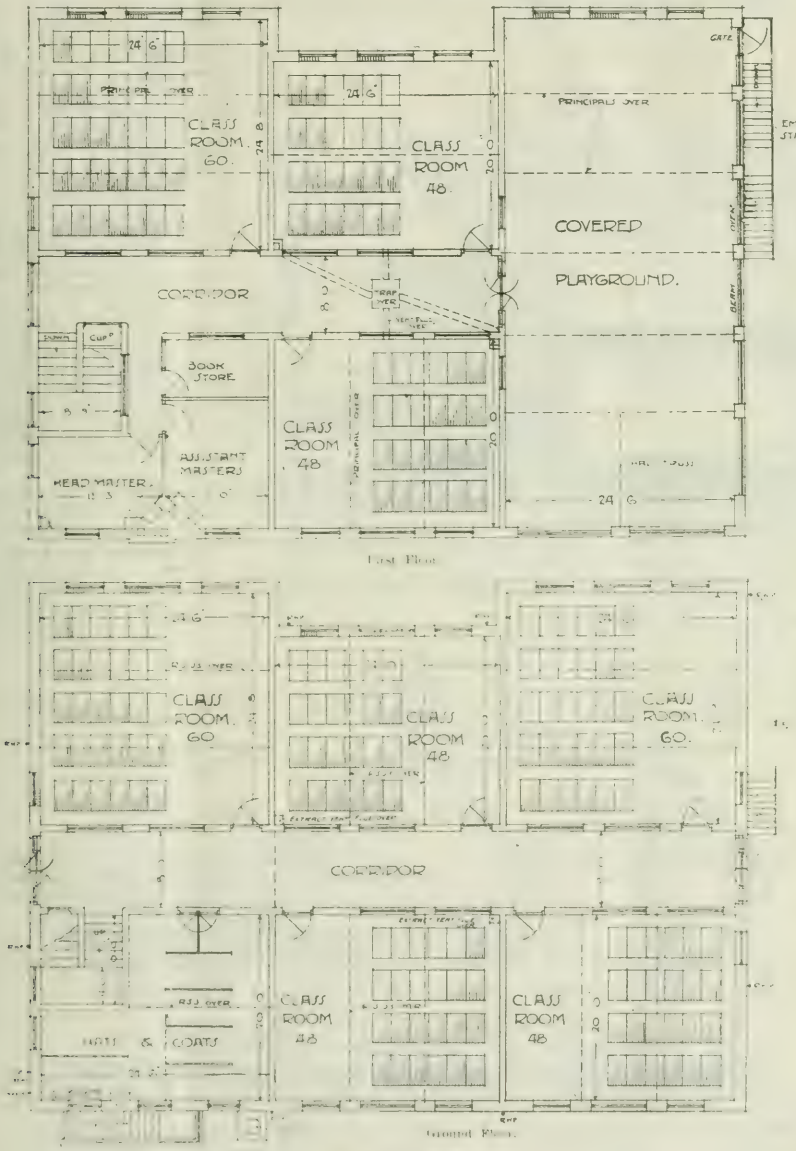
ACCOMMODATION.

The building comprises two floors and basement, heating chamber and coal store. The ground floor includes a bicycle store, three classrooms for forty-eight and two for sixty boys, with three lavatories and cloak-room accommodation.

his supervision by Mr. W. J. Macklison, of Canning Town, Mr. J. Empson being the clerk of works.

It is anticipated the final cost of the building will not exceed £5,000, or about £12 per school place.

Change of Address.—Owing to their premises having been acquired by a company with a view to rebuilding, Roadite, Limited, will remove to-morrow from



First Floor.

Ground Floor.

Strand-on-the-Green School, Chiswick.

The first floor has only one classroom for sixty boys and two for forty-eight boys, making 420 as the total present school accommodation. The lavatory and cloak-room accommodation for first-floor scholars is on the mezzanine floor.

The design was prepared by Mr. Edward Willis, Assoc.M.Inst.C.E., F.S.I., architect to the Education Committee, and the contract was carried out under

9 Great Georges-street to Broadway-court, Westminster, S.W.

Tiverton Surveyor and Tar Spraying.—The borough surveyor of Tiverton, Mr. J. Siddalls, in his annual report states *inter alia* that the advantages in the way of economy and comfort derived from tar spraying are more apparent in the case of side streets than on main thoroughfares.

MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE AT WEST HAM.

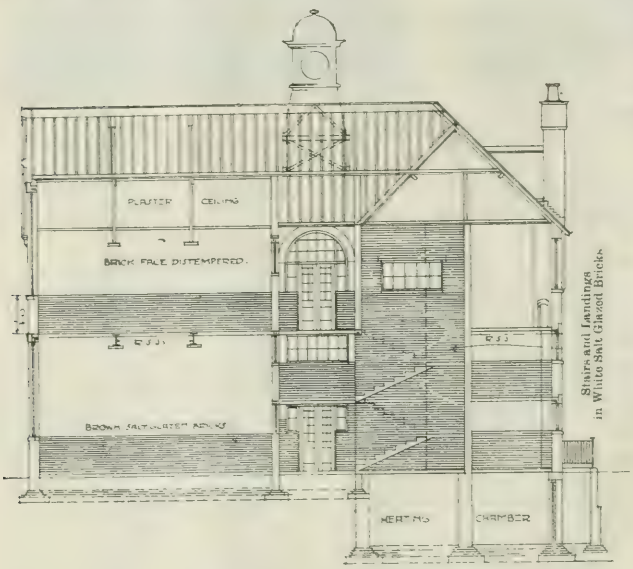
About 250 delegates, representative of the tramway undertakings of most of the principal towns in the United Kingdom, are attending the eleventh annual conference of the Municipal Tramways Association, which opened on Wednesday at Stratford Town Hall.

In his presidential address, Mr. H. E. Blain, tramways manager to the West Ham Corporation, dealt with the subject of motor 'bus competition. Taking structive effects of motor omnibus traffic. While recognising, as he did to the fullest extent, the rights of private enterprise, and the exceedingly valuable traffic facilities which had been furnished by motor omnibuses in many areas, it was unreasonable and unfair that when competition of such magnitude existed there should not be such central authority for the control of traffic as would be empowered to enact satisfactory street regulations, or that the municipally owned undertakings should be at the enormous disadvantage (in competition with private enterprise) which was entailed by their road maintenance and rating responsibilities. If competition was to exist on the public highway for the conveyance of the public, all such means of traction should pay a proportionate cost of road maintenance, should be rated on similar lines, and should be governed in the conduct of traffic by similar public regulations.

RAIL CORRUGATION.

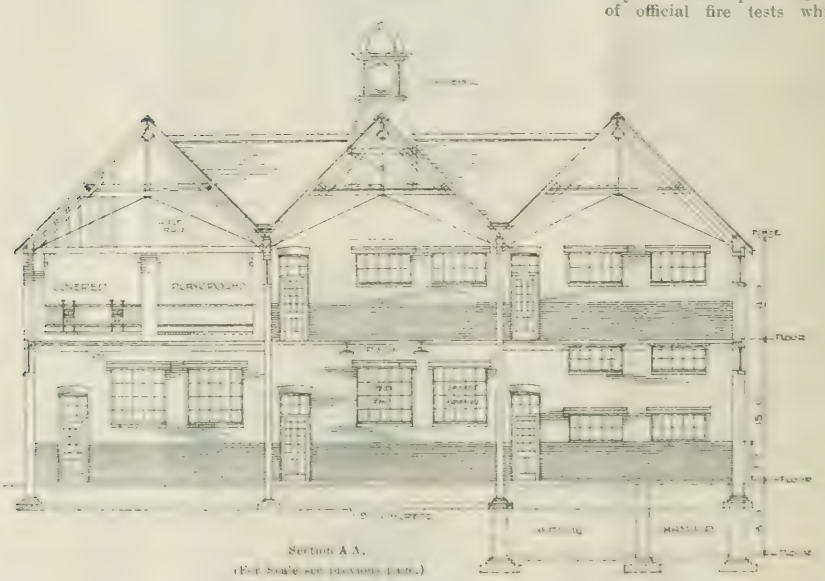
A debate took place in the course of the proceedings on the interim report of the Corrugation Committee.

Mr. C. A. King, who forwarded some explanatory comments, said that, while the action which resulted in corrugation had not yet been definitely proved, there had been a great clearing up of the subject, and future investigation could be confined within reasonable limits with the assurance that within these limits the corrugating influence would be found.



Section B B.

Celluloid and Petrol Dangers.—The British Fire-Prevention Committee opened its autumn session on Wednesday with two important series of official fire tests which



Section A A.

(For Scale see previous page.)

STRANDON THE GREEN SCHOOL, CHISWICK.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

273. Cast-Iron Stanchion.—Calculate the size of a cast-iron stanchion 12 ft. in height alongside an external or party wall to carry a load of 54 tons. (T. R.)

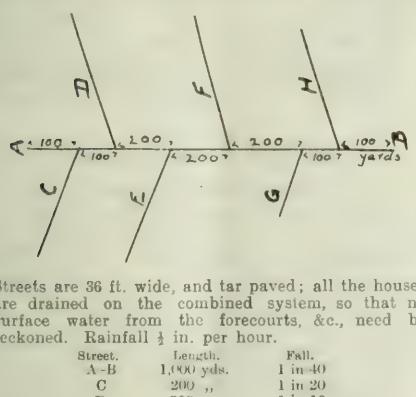
275. Cantilever.—A cantilever of uniform cross-section and length L carries a concentrated load W at the free end. A prop is placed at a point $\frac{L}{4}$ from the free end, bringing this point to the same level as the fixed end. Find an expression for the reaction at the prop, and the deflection of the free end of the cantilever. Neglect the weight of the cantilever. (B.Sc.Eng. Final.) (H. F. W., *Tottenham.*)

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

277. Sewage Disposal.—What main principles should be kept in mind in arranging the sewage disposal of the following: (*a*) A village of 800 inhabitants (purely agricultural)? (*b*) A town of 2,000 inhabitants (industrial)? (*c*) An infectious diseases hospital of 100 beds? ("Charger.")

REPLIES TO QUESTIONS.

272. Surface-Water Drainage.—State, showing the method of working out, the sizes of pipes necessary to take the surface water from streets as per sketch.



Streets are 36 ft. wide, and tar paved; all the houses are drained on the combined system, so that no surface water from the forecourts, &c., need be reckoned. Rainfall ¼ in. per hour.

Street.	Length.	Fall.
A–B	1,000 yds.	1 in 40
C	200 ,,	1 in 20
D	800 ,,	1 in 10
E	200 ,,	1 in 20
F	500 ,,	1 in 30
G	100 ,,	1 in 15
H	150 ,,	1 in 50

(F. H. S., *Sheringham.*)

In working out this problem, the first step is to arrive—taking each street in turn—at the quantity of surface water to be carried off, and upon the falls given, to select by calculation a pipe of sufficient capacity for the same. It is also well to ascertain that the velocity of the sewer is a self-cleansing one *viz.*, not less than 2 ft. 5 in. to 3 ft. per second although it is apparent in this case that there is ample velocity.

Commencing with road C, area to be drained = 36 ft. by 600 ft. = 496 acres = for all practical purposes ½ acre.

Rainfall of ¼ in per acre = 11·32 gallons per hour the pipe must be capable of carrying off 5,662 gallons per hour, which is equal to 15·12 cub. ft. per minute. A 6-in. circular pipe (the minimum size for main drainage) will carry off 87·71 cub. ft. per minute, running full (the fall being 1 in 20), so that a 6-in. diameter glazed stoneware socketed pipe should be laid in this street. This is worked out as follows:—

$$\text{Velocity} = V = 55 \sqrt{x \times 2f} \text{ where } x = \frac{\text{sectional area of flow, feet}}{\text{wetted perimeter, feet}}$$

and f = fall in feet per mile.

$$\therefore 55 \sqrt{\frac{1963 \times 2 \times 264}{1{\cdot}57}} = 55 \times 8{\cdot}124 = 446{\cdot}82 \text{ ft. per minute velocity.} \quad \text{(Eytelwein.)}$$

Discharge or carrying-off capacity = V × sectional area of flow = 446·82 × ·1963 = 87·71 cub. ft. per minute discharge. (Eytelwein.)

Street D, 900 ft. × 36 ft. = ·74 acre, say ¾ acre to be drained, which equals 22·68 cub. ft. per minute. A 6-in. pipe with a fall of 1 in 10 has a velocity of 631·95 ft. per minute (working as previous examples), and will carry off 124·05 cub. ft. per minute, so that a sewer of this diameter should be laid here.

Street E, being exactly similar to street C—15·12 cub. ft. surface water per minute to be carried off—a 6-in. sewer should be provided, the capacity of which is 87·71 cub. ft. per minute.

Street F, 1,500 ft. × 36 ft. 1·24 acres, say 1¼ acres to be drained, equal to 37·8 cub. ft. per minute. A 6-in. pipe with a fall of 1 in 30 has a capacity of 365·2 ft. per minute, and will carry off 71·68 cub. ft. per minute, so that a sewer 6 in. in diameter should be laid in this street.

Street G, 300 ft. × 36 ft. = ¼ acre to be drained, equal to 7·56 cub. ft. per minute. A 6-in. pipe with a fall of 1 in 15 has a velocity of about 500 ft. per minute. It is scarcely necessary to work this street out further, as it will be clearly seen by the preceding streets that a 6-in. sewer is undoubtedly ample.

Street H, 450 ft. × 36 ft. = ⅜ acre to be drained, or 11·34 cub. ft. per minute to be carried off. A 6-in. pipe with a fall of 1 in 50 will be found to have a velocity of 280·5 ft. per minute, and will carry off 55 cub. ft. per minute, so that a sewer 6 in. in diameter should be laid in this street.

Street A B, from A to street D, 600 ft. × 36 ft. = ½ acre to be drained, which equals:—

15·12	cub. ft. per minute, plus	
15·12	,, ,,	discharge from sewer in road C
30·24	,, ,,	total.

A 6-in. pipe with a fall of 1 in 40 has a velocity of 316·25 ft. per minute, and will carry off 62 cub. ft. per minute, so this section of sewer should be 6 in. diameter.

Street I B, from street D to H, is 2,100 ft. × 36 ft. 1¾ acres to be drained, which equals:—

52·92	cub. ft. per minute, plus	
30·24	,, ,,	discharge from sewer A to D, plus C
22·68	,, ,,	discharge from sewer D
15·12	,, ,,	,, ,, ,, E
37·80	,, ,,	,, ,, ,, F
7·56	,, ,,	,, ,, ,, G
166·32	,, ,,	total to be carried off.

A 9-in. pipe with a fall of 1 in 40 has a velocity of 386·65 ft. per minute, and a capacity of 170·78 cub. ft. per minute; and a 9-in. diameter sewer will therefore be just sufficient for this length.

The remainder of the street, from street H to point B, 300 ft. × 36 ft. = ¼ acre to be drained, which equals:—

7·56	cub. ft. per minute, plus	
11·34	,, ,,	discharge from sewer H
166·32	,, ,,	,, ,, whole of the other sewers
185·22	,, ,,	total to be carried off.

A 9-in. pipe is just too small here, so a 12-in. sewer (the next larger size) should be laid for this portion.

All the gully connections should, of course,

be made with 6-in. diameter pipes. (W. H. A., *Romford.*)

Dealing first with the inclination of the surface-water sewers, it is clear that the gradients of the streets will allow each sewer to be laid to a satisfactory fall. A comparison may be made with Maguire's general decimal rule, which states the following gradients: 6-in. pipes, 1 in 60; 9-in. pipes, 1 in 90; 12-in. pipes, 1 in 120. These gradients provide a self-cleansing velocity of flow of nearly 4½ ft. per second, which may be considered as satisfactory in the present case. The size of the pipes can be found from the equation:—

$$A = \frac{Q}{V}$$

Where A = area of pipe in feet = $\cdot 7854\, d^2$

Q = quantity discharged in cubic feet per second

V = velocity of flow in feet per second.

Taking the point B, the quantity discharged will be the total area of all the streets multiplied by the depth of rainfall—that is, $7{,}350 \times 36 \times \frac{1}{24} = 11{,}025$ cub. ft. This is discharged in sixty minutes, equivalent to 3·06 cub. ft. per second.

$$\cdot 7854\, d^2 = \frac{3 \cdot 06}{4 \cdot 5}$$

$$d^2 = \frac{3 \cdot 06}{4 \cdot 5 \times \cdot 7854}$$

$$d = \cdot 93 \text{ ft.}$$

$$= \text{say } 12 \text{ in.}$$

If the sewer A B is laid to a fall of 1 in 40, the necessary calculations would be as follows, assuming a 9-in. pipe to be adequate. First, to find the velocity by Eytelwein's formula:—

$v = 55 \times \sqrt{r \times 2f}$.

v = velocity in feet per minute.

r = hydraulic mean depth in feet = one-fourth the diameter in this case = ·187 ft.

f = fall in feet per mile = $\frac{5{,}280}{40} = 132$ ft.

$v = 55 \times \sqrt{\cdot 187 \times 2 \times 132}$

$= 55 \times 7 \cdot 02$

= 386 ft. per minute, or 6·43 ft. per second.

The size of pipe can be calculated as before:—

$$A = \frac{Q}{V}$$

$$\cdot 7854\, d^2 = \frac{3 \cdot 06}{6 \cdot 43}$$

$$d = \cdot 78 \text{ ft.}$$

It is thus shown that a 9-in. pipe is not large enough at B. From B to the connection of G, therefore, the sewer A B should be 12 in., and above this point 9 in.

Similar calculations can be used to find the correct sizes of the remaining sewers. Six-inch pipes would be large enough to drain the water from the side street, but, owing to the gully branches being formed with 6-in. pipes, and the possibility of further connections, it is usual to construct the sewers with 9-in. pipes at least. (F. E. Y., *Richmond.*)

274. Administration.—What is the best arrangement of the columns in a surveyor's cash-book (also wages-book), to show, in addition to the usual items, separate columns for the workmen's and the council's contributions under the National Insurance Act? ("R. D. C.")

The diagram shows a combined cash account and wages book, and is, I think, self-explanatory. The column on the extreme right balances with the one on the left. The intermediate space can be arranged to suit the locality. Of course, the wages-book could be kept separate, if desired.

In that case the Insurance Act part would be the same, and an ordinary cash-book could be used, an item being added to the wages to cover the insurance stamps—in this case 8½d. over the gross wages. (L. B., *Ware.*)

NEW TYPE OF ROAD SURFACE.

THE "CARPETING" PRINCIPLE.

The members of the council of the Roads Improvement Association last week inspected, under the guidance of Colonel R. E. Crompton, a new type of road surface now being laid down in Addison-road, Kensington. The material consists of graded granite, cement, bitumen and sand, heated and mixed to a temperature of 600 deg. The cost of the work—comprising a sub-layer of material 2¾ in. thick and a "wearing carpet" of smaller material 1 in. thick, making a total thickness of new surface 3¾ in.—is about 4s. 6d. per super. yard, and the contractors (The Taroads Syndicate, Limited) have given a five years' guarantee.

After inspecting the work of laying the already prepared material on the road the members travelled to the depot, and there saw the various materials mixed and heated. Colonel Crompton afterwards entertained the council at his house and, in his laboratory, demonstrated the various processes in fuller detail.

Something New in "Booby" Prizes.—A western United States town has an interesting method of selecting workmen for repairing its roads, and at the same time ridding it of undesirable citizens. When tramps hit the burg they are gathered in by the town marshal and placed in the lock-up until there are a sufficient number. They are then taken out and lined up in front of the town hall at one end of a half-mile stretch of straight road. At the other end a constable is stationed. At a pistol shot the tramps start running, and the last man to reach the end of the half-mile section secures a job repairing the roads for his board and lodging. The remaining tramps are allowed to keep on running as long as they keep headed away from the town. *The Contract Record* (Toronto).

NATIONAL ASSOCIATION OF LOCAL GOVERNMENT OFFICERS.

A mass meeting of the National Association of Local Government Officers will be held in the Congress Hall of the Latin-British Exhibition, Shepherd's Bush, to-morrow (Saturday), at 3.30 p.m. The speakers will include Sir Homewood Crawford, City solicitor, London (president); Sir Laurence Gomme, clerk to the London County Council (vice-president); Mr. E. R. Pickmere, town clerk of Liverpool (vice-president); Mr. A. P. Johnson, town clerk of Hampstead (chairman, National Council); Mr. J. E. Balmer, Cheetham, Manchester (vice-chairman, National Council); Mr. H. E. Blain, general manager, West Ham Corporation tramways; and Mr. J. M. McElroy, general manager, Manchester Corporation tramways.

The seventh annual meeting of the National Council of the association is to be held at the City of London Guildhall, on Saturday, October 12th, at 10.30 a.m.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith, and not for publication. Sketches accompanying queries should be made separate, on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

894. Cesspool Emptying.—"H. C." writes: Will you kindly inform me what firm makes Bexley carts (cesspool emptiers)? I am desirous of obtaining a cart that will empty cesspools by creating a vacuum in the cart.

The cart referred to by our correspondent is made by Messrs. George Waller & Son, Stroud, the London representative of whom is Mr. W. E. Horsman, 127 Pendle-road, Streatham, S.W.

Wandsworth Borough Council's Dispensary.—A dispensary for the treatment of consumption is about to be established by the Wandsworth Borough Council, at a cost not exceeding £1,000.

MANCHESTER SEWAGE DISPOSAL.

RIVERS COMMITTEE'S REPORT.

In its report for the year ended March 31st last the Rivers Committee of Manchester Corporation, which has control of the sewerage and sewage disposal systems of the city, states that the total charge on the rates in respect to its work during the period referred to was £112,360. Of this amount a sum of £35,108 was required for the upkeep of the Davyhulme, Moss Side, Withington, and Gorton sewage works, and for general rivers work, comprising the administration at the town hall, the cost of labour and various rivers improvements, contribution to the Mersey and Irwell Joint Committee, &c. The remainder, amounting to £77,252, was applied in the payment of interest on loans, and repayment of debt on the capital outlay on intercepting sewers throughout the whole of the city, and on the purification plant at the various sewage works.

During the year 11,667 tons of house refuse were delivered at the Withington bunkers and destroyed. In addition, 365 tons of garbage were removed from the screens and burned in the destructor, making a total of 12,032 tons of refuse destroyed. The record obtained from the gaugings at the works shows that the volume of sewage delivered at the Withington works during the year under report was 1,673,345,100 gallons, or an average of 4,597,100 gallons per day. The average daily flow of sewage per head has ranged from a minimum of 39 gallons for the four weeks ending September 13, 1911, to a maximum of 86 gallons for the four weeks ending February 28, 1912. The greatest daily flow was recorded on March 15, 1912, when 11,250,000 gallons passed down to the works.

The volume of sewage delivered at the Davyhulme works from March 30, 1911, to March 27, 1912, inclusive, was 12,382,950,000 gallons. A portion of this quantity, amounting to 129,227,000 gallons, was diluted beyond the 5 to 1 limit up to which the works are designed to treat. The average daily flow of sewage was 34,019,000 gallons, that of the previous year being 36,182,000 gallons, showing a decrease at the rate of 2,163,000 gallons per day, or nearly 6 per cent.

The report states that there are definite indications, apart from the question of rainfall and temperature, that the amount of putrescent matter in the Ship Canal water is being gradually reduced. The average effluent obtained during the year shows a higher percentage of purification of the raw sewage than has hitherto been obtained. "Further improvement," the report adds, "in the final average effluent may be anticipated as the beds on the Barton area which are at present under construction come into operation."

PRESTWICH TOWN PLANNING SCHEME.

FOUR-FIFTHS OF DISTRICT INCLUDED.

Prestwich Urban District Council have decided to make application to the Local Government Board for permission to prepare a town planning scheme under the Act of 1909, and as a preliminary a meeting of owners or other persons interested in any lands likely to be affected was held recently.

It was explained by the chairman of the council, Mr. A. E. G. Chorlton, who presided, that the main lines of communication in the district would follow the present accepted routes, and, if necessary, be extended so as to coincide with the ideas which the various landowners had formed. The preservation of trees would not be lost sight of, and with respect to residential thoroughfares it was proposed to have them constructed in a less expensive manner, with narrower carriageways, with more garden space. They proposed also to limit the number of houses per acre, and that where a certain class of house had been erected in a particular locality its value should not be depreciated by building other houses of an inferior character. Provision would be made for recreation grounds in various parts of the district, and other amenities of a social character.

The urban district of Prestwich covers an area of 2,482 acres, its population is 18,000, and the rateable value stands at £84,591. The area included in the scheme—which was unanimously decided upon by the council after consultation with the surveyor, Mr Sydney H. Morgan, ASSOC.M.INST.C.E.—is approximately four-fifths of the total area.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11 Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* **All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment.** *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. *The letter* X, *combinations such as* X.Y.Z., *and words such as* "engineer" *and* "surveyor," *should never be used.*

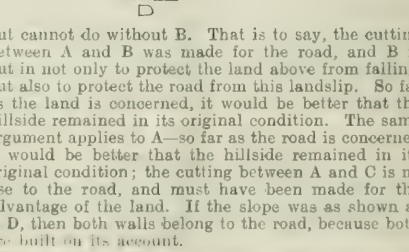
COMBINED DRAINAGE.—"Saxon" writes: A local co-operative society some years ago obtained land and built upon the front portion of it a number of shops. For the drainage of these shops the society, by arrangement with the owners of the adjoining land (now partly occupied by a street of houses), laid a drain through the land to the public sewer. On this drain the society built a manhole, but never placed a proper cover upon it. At a later period the society built five cottages at the rear of the shops, and drained these cottages into the shops drain. Up till now the society have kept the whole of the above drains clean and in repair, and have never at any time asked to have any portion of them taken over by the council as a sewer. Quite recently seventeen houses on the adjoining land were built by the owners of the land. The line of the co-operative society's drain would have been beneath two or three of these houses, so a new drain was laid by the owners of the land, and the society's drain was connected into the new one by arrangement between the parties. You will see the council have had no part in the laying of these various drains, neither, up to the time of writing, have they been requested by any of the parties to take over any portion of the drains as a public sewer. But since the opening out of a roadway (private) between the society's shops and the new houses, complaint has been made about the nuisance and danger arising through the inadequate covering of the manhole built on this ground by the society, and my council have requested the society to complete the manhole and abate the nuisance by providing and fixing a proper cover on the manhole. This the society refuse to do, now—and not until now—bringing forward as their reason the suggestion that the manhole is part of a public sewer, and that the council should do the repairs required. I contend it is not a case of repairs, but a case of uncompleted work, and that, putting all other questions of fact aside, it cannot become a public sewer until the work is completed, and the council have been asked, and have agreed, to take it over in the usual way.

In my opinion the whole of this drain, from the point at which it receives the drainage of more than one building, is a sewer: unless, therefore, it falls within either of the exceptions mentioned in sec. 13 of the Public Health Act, 1875, it is vested in the council under that section. The manhole is part of the sewer. *Staunton* v. *Wrockenham Local Board*, 11 Ch.D., 838), and the council are liable to keep it in repair under sec. 15 of the Act. I do not think the fact of its being imperfect prevents it from vesting in the council as part of the sewer, or relieves them from liability. With regard to that portion of the sewer which is in the private road it may be that the council could recover the road at the expense of the frontagers, if sufficient time has not elapsed from the construction of the sewer for the presumption that they were satisfied with it to arise. See *Waltham-stow Local Board* v. *Staines* (L.R., 1891, 2 Ch., 695.)

EXTRAORDINARY TRAFFIC.—"H. H. L. B." writes: I shall be much obliged if you will kindly advise me whether in your opinion a claim could reasonably be made for extraordinary traffic under the following circumstances. A macadamised county road, of about ½ mile in length, about 1½ miles from the nearest town, and having sand pits in the possession of three different owners on both sides, has been used for between thirty and forty years for sand carting by horse haulage, and during that time, on account of the extent of the traffic, has required annual repair. About two years ago one of the sand-pit owners commenced to use a steam tractor and trailer on this road. The weight of the tractor is within the axle-limit allowed under the Heavy Motor Cars Act, 1905, and the weight of the trailer is 4 tons 10 cwt. The load carried has been about 6½ tons, consequently the weight on each axle has been 4 tons. The road authority has now forwarded an intimation that they are about to make up the road in question in a more substantial manner, and at considerable expense and charge the owner of the tractor with the cost. The work proposed includes filling up ditches on each side after laying earthenware drainage pipes therein, and reforming the entire roadway to an increased width, with an ironstone foundation and broken granite surface. The owner of the tractor and trailer, however, only carries one-third of the sand taken over the road, and a fair amount of ordinary traffic also passes through it. The *World's Carriers* of May 15th last reported (on page 247) the result of a similar case at Greenock. As an appreciative reader of your "Law Notes" in THE SURVEYOR, however, I would value your opinion of the case herein set forth very much.

The case referred to is an interesting and instructive one. The traffic consisted of the haulage, by traction engines, of machinery, boilers and cylinders, weighing up to 65 tons (which is far in excess of the weights carried in the present case). Engineering, iron-founding, and boiler-making were staple industries of the district, and the defendants had hauled loads over the road for thirty-three years. The judge held that the substitution of traction engines for horse-drawn vehicles did not make the traffic extraordinary, and that the loads were not excessive in weight; also that the primary cause of the damage was that the plaintiffs had failed to lay down setts capable of sustaining the traffic; and he gave judgment for the defendants. Although the claim was for damages for a nuisance at common law (and not under the Locomotive Acts), the case appears to have been decided much upon the same principles as are applicable to cases under the Acts. It was established in *Hemsworth Rural District Council* v. *Micklethwaite* (68 J.P., 16, 345) that the local authority must, either in fact or as a matter of calculation, make up the roay so as adequately to carry the ordinary traffic (including locomotives if they have become part of such ordinary traffic), and only when thid has been done can a locomotive owner be made liable for extras ordinary traffic in addition. In the present case I think it is improbable that the authority would succeed in recovering the whole of the cost of the proposed works from the owner of the tractor—though they might recover something.

HIGHWAY WALLS.—Mr. G. P. Robertson, M.I.MUN.E., M.I.C.E., &c., municipal engineer, Darjeeling, writes: On p. 770 of THE SURVEYOR for May 24th I notice a query from "R. C. C." anent "Highway walls." He says that the wall at B rightfully belongs to the owners of the land, and you say that it is a "question" of fact whether or not the wall is part of the highway. In Darjeeling the "question of fact" considered is the original run of the bank. If this was as shown at B C, then B belongs to the highway and A to the land, because the highway can do without A,



but cannot do without B. That is to say, the cutting between A and B was made for the road, and B is put in not only to protect the land above from falling, but also to protect the road from this landslip. So far as the land is concerned, it would be better that the hillside remained in its original condition. The same argument applies to A—so far as the road is concerned it would be better that the hillside remained in its original condition; the cutting between A and C is no use to the road, and must have been made for the advantage of the land. If the slope was as shown at B D, then both walls belong to the road, because both are built on its account.

This is a very interesting communication, and the test suggested undoubtedly seems to afford a very practical method of solving the problem, when the original slope of the bank can be ascertained.

WATER RATE.—"S." writes: I shall be glad of your opinion on the following matter: "A corporation water undertaking has usually, in the case of an altered (reviewed) assessment, based their charges from the commencement of a quarter immediately after the actual date of entry on the overseer's books." Is this correct or should the altered charges date back to the date of appeal? In the case of general district rate I am aware that the latter is correct, but in the case of water rent I suggest the former is correct, seeing the clause reads: "The R.V. of any such premises as above and shall be ascertained by the valuation list in force at the commencement of the quarter

for which the rate accrues." As you are aware, water rate can be demanded in advance by equal quarterly payments.

According to a strict reading of the clause this would appear to be correct. The assessment committee are bound to alter the valuation list in conformity with the decision of the Court of Appeal, but until they do so the unaltered list is presumably "the valuation list in force."

Alterations to Building.—"R. J. H." writes: In this district the work of reconstructing an old cottage is being carried out in the following manner: The old roof has been left underpinned and the new walls, &c., are being built underneath. This work is being carried out under a notice from the inspector under the Housing and Town Planning Act. Is it necessary for the persons erecting this building to submit a plan to the council's surveyor? The council have adopted the by-laws of the Local Government Board. Will this be termed a new building within the meaning of the Act?

The question what alterations constitute the erection of a new building for the purpose of by-laws is one of fact to be determined in each particular case after considering all the circumstances. In the present case I should think it would in all probability be held that a new building is being erected, in which event plans must be submitted.

Private Street Works: Resewering.—"Arosa" writes: A street has been sewered to the satisfaction of the local authority, and some years afterwards made up by the local authority under sec. 150 of the Public Health Act, the council at the same time putting in a new surface-water sewer, and charging for it with the cost of making up the street to the frontage owners. I am informed that the local authority cannot charge the cost of laying the new surface-water sewer with the making up of the street, as the street has already been sewered. I shall be much obliged if you will inform me of any decisions by the Local Government Board or of any cases.

If a street has once been sewered to the satisfaction of the local authority they cannot require it to be resewered at the expense of the frontagers. As a general rule, and in the absence of special circumstances, when a sewer has existed for a long period, it will be assumed that the authority have accepted it as a sewer laid to their satisfaction (see *Homelia* v. *Twickenham Local Board*, 29 Q.B.D., 951). As an instance of special circumstances entitling the authority to resewer at the frontagers' expense, see *Walthamstow Local Board* v. *Staines*, L.R., 1891, 2 ch., 498. If no special circumstances exist in the present case the authority cannot, in my opinion, charge the frontagers with the cost of the new surface-water sewer.

Alteration of Area: Main Roads.—"Clairnian" writes: Has a borough, upon extending its boundary, powers compulsorily to take over the main roads in the new portion? In the case in question, at the passing of the Local Government Act, 1888, the borough took over the repairs of the main roads passing through it. Can it do so with those portions of the main roads acquired in the proposed extension of the borough? The powers in the Local Government Act, 1888, appear to apply to areas in existence at the time of the passing of the Act.

I do not think the council could claim to retain roads within the added area which for twelve months prior to the date of the extension of the boundary had been main roads (see "Lumley's Public Health Acts," 9th Edition, note (c) on p. 600). But as to other main roads I think the council could claim to retain them within twelve months from the respective dates of their becoming main roads.

Highway: Tunnelling under Carriageway.—"G. L. M." writes: A large ratepayer has business premises on either side of a narrow street in my district. He wishes to connect the two places by tunnelling under the carriageway, and claims that he has the right to do this seeing that he holds the freehold on both sides. Can he do this after giving the council due notice?

This being an urban district, the owner cannot construct any vault arch or cellar under the carriageway without the written consent of the urban district council, under sec. 26 of the Public Health Act, 1875. See *Walker Urban District Council* v. *Wigham Richardson & Co.* 106 J.P., 152.

NEW SECONDARY SCHOOL FOR HEREFORD.

On the 14th inst., Sir James Rankin, Bart., performed the opening ceremony in connection with a new secondary school for boys at Hereford, the total cost of which, including land and furnishing, has amounted to £10,000.

The building, which is the largest of its kind in the county, is constructed of local red bricks, with Bath stone facings, and the arrangements are of a thoroughly up-to-date character. The accommodation provided is as follows: Ground floor—separate cloakrooms and lavatories for senior and junior boys, caretaker's store, head master's and assistant master's rooms. Immediately behind the main block is placed the large assembly hall and six classrooms, two of the latter being so constructed as to be easily convertible into part of the large hall. On the first floor there are science and art rooms, together with a dining-room and kitchen attached. The school is heated on the low-pressure hot-water system.

Hereford New Secondary School.

Messrs. E. W. Wilks & Son, Hereford, were the contractors, Mr. G. H. Jack, F.G.S., county surveyor and architect, being responsible for the design of the new building.

Third International Road Congress.—A meeting of the Traders' Committee will be held at the offices of the Road Board on Monday next, at 2.30 p.m., to receive reports from the Entertainment and Demonstration Sub-Committee, the Exhibition Sub-Committee and Motor Car Sub-Committee, and to transact any other business.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangement well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bacup T.C. (September 10th. Mr. R. H. Bicknell). £17,148 required for the paving of Burnley-road, Rochdale-road, and York shire-street.—The borough surveyor, Mr. J. Entwistle, stated that the average breadth of Rochdale-road is 34 ft. 9 in. The carriageway was 28 ft. 9 in. It was not proposed to widen the roadway. There was a footway on one side only measuring 6 ft. At present the road was partly of local setts and macadam. These would be taken up, and excavations sufficient to enable them to put down 6 in. of concrete, and on top of that granite setts 5 in. by 4 in., pointed with pitch and oil. The length of Burnley-road to be paved was 668 ft., and the area 1,804 ft. Tenders had been provisionally accepted for the work as follows: Rochdale-road (except the setts), £7,007; Yorkshire-street, £443; Burnley-road, £715.

Bristol T.C. (September 19th. Mr. M. K. North). —£6,646 for the electricity undertaking, and £1,391 for the widening of Blackswarth-road, Wood-lane, Lodge-hill, Fishponds-road, Bath-road, Victoria-road, Bedminster; Soundwell-road, Dean-lane, Southville, and Johnson's-lane, St. George.—The schemes for street widening were explained by Mr. W. H .Wise (from the town clerk's office). He stated that in each case there was a provisional arrangement for the purchase of the land at an agreed sum. The land was only of the actual extent required for the improvements, and there would be no surplus. In only one case had the work been begun in anticipation of the sanction of the Local Government Board, and that was at Johnson's-lane. Under the by-laws the minimum width of a road must be 30 ft., and the alterations complied with that rule. Asked if there had been an independent valuation of the properties, Mr. Wise said the values had all been settled by the consulting engineer, Mr. T. H. Yabbicom. The loan of £6,646 for the electrical undertaking consisted of several items. At the Temple Back works it was intended to instal a motor converter and switch gear at a cost of £3,785. At the Avonmouth works there would be improvements in the water supply costing £1 398, and a secondary coal-handling plant costing £515. These were new items. Then, in connection with the laying of the electric mains from Bristol to Avonmouth, £947 had been expended over and above the estimated amount sanctioned by the Local Government Board, and that money they sought powers to borrow. As to the motor converter and switch gear at Temple Bank, owing to increased load, it was imperative that it should be installed, preferably before the 1912 winter load.

Blyth U.D.C. (September 5th. Mr. R. H. Bicknell). —£900 for the purchase of land at Cowpen Quay for purposes of public walks and pleasure grounds, and for certain street works in connection therewith, and £1,025 for purposes of Cowpen Cemetery.—The necessary particulars were given, the surveyor, Mr. R. Grieves, stating that the loan for cemetery purposes had been increased from £600 to £1,025 for the purpose of draining the extended area—about 3½ acres.

Bourne U.D.C. (September 12th. Mr. W. O. E. Meade-King).—£925 for the purchase of land adjoining the sewage works.—The land in question consists of about 14 acres. The council, it was stated, propose to let the land not required for sewage purposes as allotments.

Chatham T.C. (September 13th. Mr. M. K. North). £2,500 for the extension of the cemetery.—It was stated that the land was suitable in every way for the purposes of a cemetery: it was high and dry with a chalky soil, and there was no source of the water supply of the town near the site. The subsoil was of a porous nature, and no drainage would be required. The area of the land was over 36 acres.

Colne T.C. (September 10th. Mr. F. H. Tulloch).—£24,462 for paving Alkincoates-road and a hundred other streets, £438 for the widening of the Red-lane footpath, and £470 for the widening of the Black-lane path. The town clerk (Mr. A Varley) said a number of objections had been made by private owners against the work being carried out. Some asked for time to pay, but this would not affect the inquiry. The town clerk added that the hundred streets included fifty-two front streets and forty-eight back streets. The scheme was explained in detail by the borough surveyor, Mr. T. Hartley.

Cosport U.D.C. (September 17th. Mr. M. K. North). —£1,670 for sanitary works.—The surveyor, Mr. H. Frost, explained that it was desired to complete the drainage system by connecting properties not already included. There was no opposition to the application, but Mr. Hooley raised the question of the recovery of a portion of the cost of this work from the property owners. The inspector said that was a matter that would come before the council when the loan had been secured. Their clerk or legal adviser would direct them upon the point. Mr. Savage and Mr. Fleming hoped that this matter would be pressed as much as possible, pointing out that the owners of the property in question were those who had hung back from carrying out the connection of their property.

Harrogate T.C. (September 7th. Mr. R. H. Bicknell).—£2,700 for the extension of the Royal Pump Room; £250 for the provision of a new entrance for the Valley Gardens; £4,170 for the extension of the water supply of the borough, including the provision of a supply to Goldsborough; and £2,000 for additions to the Victoria Baths.—The town clerk, Mr. J. Turner Taylor, stated that the application for £2,700 for extensions to the Royal Pump Room was made by the corporation under statutory powers granted them for the purpose of utilising the mineral waters, and there was a great need for the extension of the present pump room for the accommodation of people resorting there to take the waters. They had no covered place to which the people could go, and in a season such as the present one, when there were so many wet days, the pump room became very congested, and they received many complaints. What they proposed to do was to construct additional accommodation in connection with the main building, which would not be interfered with in any way. The borough surveyor, Mr. C. E. Rivers, presented plans and estimates for the proposed work. With respect to the Goldsborough water supply it was stated that the Harrogate Corporation had power to supply water to places outside the borough boundary, and Lord Harewood, who was the owner of all the land in the village of Goldsborough, had asked them to provide a supply for that village. The Knaresborough Rural District Council, under whose jurisdiction the village was, had power to take over the supply when they had paid to the Harrogate Corporation the capital outlay. There was a great need for a proper supply of water to this village. It was further explained that the £2,000 for the Victoria Baths was required for additional accommodation for the taking of sulphur and mineral water baths, and various other treatments.

Hay (Brecknock) U.D.C. (September 19th. Mr. A. A. G. Malet).—£4,000 for purposes of sewage disposal.—M. Holt, town clerk of Hereford, urged the promotion of the scheme at the earliest possible date, for at present the sewage of Hay was a source of pollution to the river Wye, from which Hereford inhabitants drew their water supply. Hereford's intake was below Hay, and the present proceedings were the result of pressure. They had not taken legal action, but were prepared to do so if necessary. The clerk, Mr. R. T. Griffiths, explained how at present the town emptied its sewage into the river Wye and its tributary, Dulais Brook. In reply to Mr. Corner, Mr. Wilcox said he did not think the sewage farm would mean any depreciation in the value of the surrounding properties. The inspector: Are you taking the sewage on to undrained land? Mr. Wilcox: Yes. The inspector: I am afraid the board will not agree to that.

Smethwick T.C. (September 13th. Major J. Stewart). —£7,950 for street improvements in Rolfe-street and Raybone-lane, Smethwick.—Mr. J. C. Lloyd, deputy town clerk, explained that the scheme was to relay part of the existing granite pavement in Rolfe-street, and to lay the remaining portion with granite setts. In consequence of the heavy traffic along these thoroughfares between Smethwick and Handsworth it was thought it would be more economical to pave the road.

Stalybridge T.C. (September 10th. Mr. T. C. Ekin). —£6,400 for alterations and additions at the public baths, and £1,692 for the erection of buildings and workshop at the Waterloo-road depot for the highways department. It was explained that the old baths were out of date, and that the intention was to make extensive improvements and additions to the building, including the Turkish baths. It was proposed to introduce continuous filtration and aeration of the water

used in the baths. With respect to the proposed new buildings for the highways department, it was stated that it was proposed to put on the ground floor a room for the fire escape and horse ambulance, as well as a wheelwright's shop, and accommodation for the weights and measures department.

Wednesbury T.C. (September 12th. Mr. H. R. Hooper).—£3,700 for the purchase of an engine and dynamo at the electricity station. In the course of the inquiry the inspector said that according to the plan the roof would not be fireproof. He understood they had had a fire already, and it was highly desirable that such buildings should be fireproof.

York T.C. (September 6th. Mr. R. H. Bicknell).—£3,030 for the purchase of land in Bull-lane, Heworth, York, for the purpose of a recreation ground.—It was stated that there was a demand for a recreation ground and bowling greens at Heworth. The value of the land was far above £3,000. The inspector said he had visited the place, and he considered it a most reasonable site, but he hoped the children would get their fair share of the land.

APPLICATIONS FOR LOANS.

Linthwaite U.D.C.—£2,500 for new sewers.

Nuneaton T.C.—£6,000 for an improvement scheme.

Portland U.D.C.—£5,079 for new municipal offices.

Rishton U.D.C.—£4,200 for the provision of working-class dwellings.

Saffron Walden T.C.—£863 for making up a street.

Southampton T.C.—£5,670 for sewage disposal works.

Southend T.C.—£3,900 for an additional 500-kw. steam generating set.

Swansea T.C.—£3,600 for relaying water main.

Woking U.D.C.—£1,337 for proportion of the cost of new bridges.

LOANS SANCTIONED.

Battle U.D.C.—£1,500 for the erection of six working-class cottages.

Bo'ness T.C.—£1,000 for electricity extensions.

Buckingham R.D.C.—£1,100 for the provision of six cottages.

Chester-le-Street R.D.C.—£8,500 for the council's share of the cost of building a bridge over the Wear.

Darfield U.D.C.—£1,722 for the provision of a cemetery.

Godalming T.C.—£5,000 for repaving the main streets.

Hayes U.D.C.—£8,717 for workmen's cottages.

Leatherhead U.D.C.—£1,650 for the provision of a recreation ground.

Lowestoft T.C.—£1,812 for street improvement works.

Mansfield T.C.—£1,000 for the purchase of a recreation ground.

Oswaldtwistle U.D.C.—£3,000 for meters and cookers.

Southend T.C.—£7,013 for works of street improvement.

COMBINED DRAINAGE.

METROPOLITAN COMMITTEE'S PROPOSALS.

The Public Health Committee of the Camberwell Borough Council recommend the council to concur in a resolution passed by the Executive Committee of the Metropolitan Boroughs Standing Joint Committee in the following terms: "That the Standing Joint Committee be recommended to endeavour to secure in the next Session of Parliament an amendment of the law relating to combined drainage on the lines of the Metropolitan Sewers and Drainage Bill of 1908, and that the City and Metropolitan Borough Councils be requested to agree to bear a proportionate part of the cost of the promotion of the proposed Bill, and to concur in the promotion thereof." It is suggested that the proposed legislation should follow the lines adopted at a conference of metropolitan authorities convened by the St. Pancras Borough Council in 1908, but that in order the better to ensure the Bill being properly considered, it should be promoted as a private measure by or on behalf of the Metropolitan, City and borough councils at the joint expense of those authorities.

The following is the clause proposed: "In and for the purposes of the Metropolis Management Acts, 1855 to 1899, and the Public Health (London) Act, 1891, or any Act or Acts amending the same, the word 'drain' shall be deemed to include any sewer or drain, whether constructed before or after the passing of this Act, with which two or more houses, buildings or premises are, at the date of the passing of this Act, or may at any time thereafter be connected, or which is used or capable of being or intended to be used for the conveyance of the drainage of such houses buildings or premises directly or indirectly to any sewer which has been approved as such by the Metropolitan Commissioners of Sewers, the Metropolitan Board of Works, or the London County Council, but shall not include any sewer so approved as aforesaid."

Problems in Engineering with Solutions.*—The English journal The Surveyor and Municipal and County Engineer carries on a section devoted to various questions which might be put in an examination for the position of municipal engineer in an English town or city. The questions are given one week and answers provided by various correspondents given in subsequent issues. The volume noted above is the first one to be made up from these questions and answers. As is well known, the position of municipal engineer in England is one of most varied activity, so that the subject covered by the questions and answers extends through the whole field of engineering. For example, the chapter headings are as follows: Mechanics and Hydrostatics; Strength and Elasticity of Materials; Theory of Structures; Surveying and Levelling; Water Supply and Hydraulics; Sewerage; Sewage Disposal; Road Making and Tramways; Building Construction and Materials; Law and Miscellaneous. While the questions and most of their solutions are distinctly British in character, the wide range of subjects and the method of treatment make the book of some value to American engineers. There is a good deal to be said in favour of the question and answer method of instruction.—*Engineering News.*

* Being Questions and Answers reprinted from the Assistants' and Students' Section of The Surveyor and Municipal and County Engineer. First Series, 1909-10. Edited by Sydney G. Turner, associate, i.s.e.e. London: St. Bride's Press, Limited. Price 5s. nett.

Municipal Work In Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Barnsley, Birmingham, Cardiff £15,000, Edinburgh £7,000, Grimsby £13,333, Worcester; housing and town planning—Gosport; roads and materials—Darlington, Hastings £13,000, Morecambe, Swansea; sewerage and sewage disposal—Southampton £5,670; water, gas and electricity—Hastings £32,109.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Barnsley T.C.—A committee has been appointed to consider the question of providing new offices and a town hall.

Birmingham T.C.—The work of completing the Birmingham Council House extension and art gallery was advanced another stage on Monday last, when the General Purposes Committee accepted, subject to the approval of the council, the tender of Messrs. Barnsley & Sons, at £57,058. The contract, which is to be finished in eighteen months, provides for the extension of the art gallery by the erection of a further suite of "Feeney Galleries," which will have an imposing entrance from Great Charles-street, and the provision of additional departmental accommodation and a museum of casts. Messrs. Jeffreys & Co., the present contractors for the heating, ventilation and hot-water supply, will extend the system to the new buildings, at a cost of £1,742.

Blackpool T.C.—The borough surveyor, Mr. J. S. Brodie, has been instructed to prepare plans and estimates for the construction of new and more suitable public conveniences near the Layton tramway terminus.

Camberwell B.C.—The Public Health Committee recommend that the borough engineer, Mr. W. Oxtoby, be authorised to carry out the repainting of the public baths, Church-street, at a cost of £258.

Cardiff T.C.—The Watch Committee, on Monday last, received the awards of the assessor, Mr. A. Marshall McKenzie, F.R.I.B.A., of London, in the competitive designs for the new fire station, to be erected in Westgate-street, at a cost of £15,000. The awards were: (1) Messrs. E. Vincent Harris & Thomas J. Moodie, London; (2) Messrs. Ivor Jones & Percy Thomas, Cardiff; (3) Messrs. Mangor & Littlewoods, Manchester; (4) Messrs. Wilmot & Smith, Cardiff. The committee unanimously accepted the design of Messrs. Harris & Moodie, who were the architects for the new county hall in Cathays Park. The award of £75 for the second design goes to Messrs. Ivor Jones & Percy Thomas, of Cardiff, who are the architects for the new technical institute; and the authors of the third and fourth designs receive respectively £50 and £25.—The Parks Committee recommend the construction of an open-air bath in Llandaff Fields. It is proposed that the pond should be 150 ft. long by 50 ft. wide. Mr. W. Harpur, the city engineer, has been instructed to prepare a plan and submit an estimate of the cost.

Chester-le-Street R.D.C.—The Lumley Bridge Committee report that at a joint meeting between that body and the representatives of the urban district council, it was decided to recommend that the tender of Messrs. Brims & Co., Newcastle, at £9,916, for the building of the new bridge over the Wear at Chester-le-Street, should be accepted. The tenders, it was reported, were all in excess of the estimates, and the engineer, Mr. D. Balfour, junr., stated that this was due to the increase in the cost of material and labour during the last two years. It has also been agreed that the tender of Messrs. Thompson & Son, of Chester-le-Street, at £4,597, for making the roads to the bridge, should be accepted.

Coventry T.C.—The tender of Messrs. Jones & Bacon, at £2,333, has been accepted for the extension of the market.

Dorking U.D.C.—The surveyor, Mr. W. A. Clegg, has been authorised to carry out necessary repairs and improvements at the council's stables.

Downham (Norfolk) R.D.C.—The common seal of the council has been affixed to the agreement with the county council for the rebuilding of Magdalen Bridge, on the terms agreed upon. These are that the county council undertake to rebuild the bridge, at an estimated cost of £6,000, the district council guaranteeing to contribute the difference between £2,000 and the sum provided voluntarily by the locality (said to be £500).

Edinburgh T.C.—Tenders, approximating to £7,000, have been accepted in connection with the erection of the new Portobello Town Hall.

Grimsby T.C.—The tender of Messrs. J. H. Thompson & Sons, of Grimsby, at £13,333, has been accepted for the erection of a new school in Victoria-street.

Kingston (Surrey) T.C.—Land in Richmond-road, with a frontage of about 60 ft. and a depth of 170 ft., is to be purchased for £1,000 for a site for the new fire station.

Wandsworth B.C.—The Public Health Committee recommend that a tuberculosis dispensary should be established in the borough. The cost of the apparatus and of furnishing and fitting up the rooms is put at £120, and the annual cost of maintenance at £880.

Whitby R.D.C.—The tender of Mr. A. Palframan, at £224, has been accepted for the construction of the new Wath Bridge.

Worcester T.C.—The Health Committee have unanimously passed a recommendation in favour of central baths, which will be available throughout the year. These will be in addition to the provision in the river Severn.—A school is to be built on the site of the skating rink in the Arboretum, at an estimated cost of £1,500. The plans are limited to Worcestershire architects.

HOUSING AND TOWN PLANNING.

Gosport U.D.C.—The surveyor, Mr. H. Frost, has prepared a town-planning scheme for the North Ward, which has been approved and forwarded to the Local Government Board.

Pembroke (Co. Dublin) U.D.C.—Certain areas have been declared unhealthy within the meaning of the Working Classes Act, and it has been agreed to promote an improvement scheme.

Portadown T.C.—The medical officer of health, Dr. Rowlett, last week reported that certain houses, streets and courts, by reason of sanitary defects, constituted an insanitary area, which could only be effectually remedied by the demolition of the houses and by the rearrangement and reconstruction of the streets. The area in question, Dr. Rowlett stated, containing 196 houses, having a population close on 1,000 persons, crowded together and breathing vitiated air, seriously affecting the health of the residents, and in the past serious epidemics of disease had only been allayed by the constant and untiring efforts of the council's responsible officers. The report is to be considered by the Sanitary Committee.

Selby U.D.C.—An offer is to be made for a plot of land in Armoury-lane for the building of about fifty artisans' houses, and the purchase of land in Flaxley-road for a similar purpose is also contemplated.

PARKS AND OPEN SPACES.

Bushey (Herts) U.D.C.—The surveyor, Mr. Ernest E. Ryder, has been instructed to prepare plans and estimates for bowling greens and pavilions at King George's and Bushey-grove recreation grounds.

Llanelly U.D.C.—Parc Howard, the gift of Sir Stafford and Lady Howard, was handed over to the town on Saturday last.

Southampton T.C.—A sub-committee of the Public Lands Committee has been asked to consider the question of providing bowling greens on public lands.

REFUSE COLLECTION AND DISPOSAL.

Oakham R.D.C.—The Local Government Board have written advising that the system of public scavenging already established at Greetham and Langham should be extended to all the larger villages in the district.

ROADS AND MATERIALS.

Darlington T.C.—It has been decided to relay the whole of the streets of the town, the total length of

which is over 12 miles, with tar-macadam. The work will be done as occasion for the repair of the streets arises.

Dorking U.D.C.—The tender of Mr. H. M. Blaker, at £675, has been accepted for surfacing 4,043 sq. yds. of London-road. The cost of the work will be repaid by the Surrey County Council.

Hastings T.C.—A scheme has been adopted for an extension of the Parade, seaward, at a point between the baths and Hastings Pier, to provide accommodation for about 2,000 people, at a cost of about £13,000.

Maldens and Coombe U.D.C.—The owners of the Fitzgeorge Coombe estate are arranging with the Highways Committee for a boulevard scheme in Coombe-road, and the provision of ornamental gardens and paths in Coombe-lane, by the dedication of sufficient land for these purposes.

Morecambe T.C.—The borough surveyor, Mr. F. W. Hipwood, has prepared a comprehensive improvement scheme, which Mr. J. H. Brown, a councillor, stated recently he should like to see proceeded with. At present, he said, Morecambe was doing nothing in the way of improvements, and it was high time that more money was spent to remove the reproach so often levelled that the town was not progressive. He contended they should spend another £50,000 on widening the Promenade at the east end, and so prove to outsiders that Morecambe meant to be in the forefront of holiday resorts.

Swansea T.C.—The borough surveyor, Mr. G. Bell, at the last meeting of the Parks Committee, submitted a proposal for a proposed pier and promenade and a winter garden in the Victoria Park, which he prepared some years ago, and suggested that it would prove a good thing for the town and prove an attractive feature to visitors. The matter was referred to a sub-committee with instructions to report at once.

SEWERAGE AND SEWAGE DISPOSAL.

Ashby U.D.C. The profits on the working of the sewage farm for the year exceeded £97.

Kingston (Surrey) T.C. The tender of Messrs. Stewart Brothers for the supply during the ensuing twelve months of 8,000 yds. of press cloth for the sewage works at 5⅞d. per yard has been accepted; and 100 tons of charcoal have been purchased from Messrs. Cowburn, Limited, at 26s. 6d. per ton.

Preston R.D.C.—A communication has been received from the Local Government Board with reference to the council's sewerage scheme in connection with the township of Longton and Little Hoole, drawing the council's attention, as regarded the difficulty experienced in obtaining easements, to the provisions in secs. 16 and 308 of the Public Health Act, 1875, from which it would be seen that the laying of necessary sewers was not in any way dependent upon the consent of owners being obtained. It appeared to the board that, having regard to the admitted necessity for a proper scheme of sewerage and sewage disposal for these areas, no avoidable delay should be allowed to occur in carrying such a scheme into execution. The letter has been referred to the Sewage Committee.

Poole R.D.C.—One of Messrs. Merryweather's vacuum cesspool exhausters, to take 350 gallons, is to be obtained, at a cost of £276.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, has submitted a scheme, which has been approved, for the treatment of the sewage in Bitterne Park district. It is proposed that half the sewage be run into the tanks by gravitation, and that the remainder be pumped. The estimated cost, including engine-house, engines and pumps, is £5,670.

Tiverton T.C.—The borough engineer, Mr. J. Siddalls, in a report, stated that before long some improvements in the older portions of the sewerage system must be made. It may be possible, however, by the construction of manholes and provision of flushing apparatus to keep the old sewers going for many more years without detriment to the sanitary well-being of the town. Disposal of house refuse, he adds, gives greater difficulty than ever.

WATER, GAS, AND ELECTRICITY.

Fifeshire C.C.—The district committee recommend the scheme of Messrs. Bruce & Proudfoot, engineers, for a new reservoir at Largs, at an estimated cost of £4,570.

Hastings T.C.—A scheme has been adopted for the development of Forewood waterworks, at a cost of £32,109.

Lexden and Winstree (Essex) R.D.C.—The council have instructed Messrs. Taylor & Walling (Mr. Harry W. Taylor, ASSOC.M.INST.C.E.), of Newcastle-upon-Tyne and Birmingham, to prepare a scheme and report upon the waterworks for the parishes of Abberton, Peldon, Little Wigborough, Great Wigborough, Virley and Salcott.

Totnes R.D.C.—A scheme for a water supply for Bittaford, Ugborough, has been approved.

Uckfield U.D.C.—The question of applying for a Provisional Order for the supply of electricity at Crowborough, is under consideration.

MISCELLANEOUS.

Kenilworth U.D.C.—Nine tenders have been received for fencing the proposed new cemetery, and the contract has been divided between Messrs. Bayliss, Jones & Bayliss, of Wolverhampton (£308), and Messrs. Hill & Smith, of Brierley Hill (£308).

Leicester T.C.—The council have approved the proposals of the Tramways Committee for extending and linking up the present tramway routes, and establishing a motor bus service to Thurmaston. The total cost of the extensions for which powers are to be sought will be about £100,000, but the work will be proceeded with in sections when the time is considered ripe.

Maldens and Coombe U.D.C.—The council recently decided to pay the contributions of their employees under the Insurance Act. The Local Government Board, however, have now informed the council that they have no power to sanction such payments.

Montgomery C.C.—It has been decided to increase the wages of the roadmen and other labourers from 16s. to 17s. per week, with a weekly allowance of 3d. for providing tools.

Otley U.D.C.—It has been agreed to support the Leeds Corporation in their effort to obtain Parliamentary powers for the extension of their tramway system from the present terminus at Guiseley to Otley. Since the extension of the route from Horsforth to Guiseley this line has proved very popular with Leeds people who desire to get out into the country, and several suggestions of a continuation have been made.

Rowley U.D.C.—The Local Government Board have given their approval to the provision and use of the land at Powke-lane, Black Heath, for burial purposes, on condition that the council gave an undertaking that burials should not take place within 100 yds. of any dwelling.

PERSONAL.

Mr. D. Munro, burgh surveyor of Nairn, has resigned.

Mr. J. H. Clarke, assistant surveyor to the Romford Rural District Council, has been appointed surveyor to the Haverhill Urban District Council.

Mr. F. C. Hodgkinson, surveyor of Birkdale, whose area has been amalgamated with Southport, is to receive £1,550 as compensation for loss of office.

Mr. J. W. Liversedge, surveyor to the Leigh Urban District Council, has had his salary increased by £25 per annum, to be followed by a similar increase next year.

Mr. A. M. Ker, assistant surveyor of Warrington for ten years, was on Monday appointed to succeed the late Mr. T. Longdin as borough surveyor of Warrington at a salary of £450 a year.

Mr. C. T. Fulcher, for three years and a-half draughtsman in the Shoreditch borough surveyor's department, has been appointed assistant surveyor at a salary of £160, rising to £200.

Mr. Stanley Llewellyn, deputy surveyor to the Ogmore and Garw Urban District Council, has had his salary increased from £104 to £120, rising by annual increments of £10 to £150 a year.

Mr. T. de Courcy Meade, M.INST.C.E., as will be seen from the present issue, was the author of one of the papers presented at the recent Congress of the Royal Institute of Public Health in Berlin. It is not, perhaps, generally known that Mr. Meade, shortly after receiving the invitation to contribute to the proceedings of the congress, was unfortunate enough to be involved in a cab accident, which resulted in his

receiving such severe injuries to the face and head that he was incapacitated from work for many weeks, and obliged to proceed to a nursing home in London for treatment. The absence of diagrams and statistical information which Mr. Meade had proposed to include in the paper is one of the consequences of the accident, but while they will regret that he should have been prevented from doing proper justice to the important subject with which his contribution deals, all who are privileged to know him will, we are sure, experience feelings of the liveliest satisfaction at his providential escape from more serious disaster.

FOR OTHER ADVERTISEMENTS

See End of Paper.

TO CONTRACTORS AND OTHERS.

The Council of the Metropolitan Borough of Wandsworth is prepared to receive Tenders for Executing necessary Works of Repair upon the following Carriage Roads—*viz.*:—

(*a*) That part of Wimbledon Park-road, Southfield, which lies between the south-west side of No. 365 Wimbledon Park-road and Prince's-road.

(*b*) That part of Viewfield-road, Southfield, which lies between Granville-road and Melrose-road.

The Specifications and Drawings may be seen, and Forms of Tender obtained, of the Borough Engineer, Mr. P. Dodd, M.INST.C.E., at the office of the New Streets Department, No. 56 East-hill, Wandsworth, S.W., between the hours of 10 and 4 (Saturdays 10 and 12), upon payment of a deposit of Five Guineas in each case.

Tenders, enclosed in separate sealed envelopes, and endorsed "Tender for Repairing ——," must be delivered at the Council House, East-hill, Wandsworth, S.W., and may be placed by the person tendering in the box provided for the purpose, not later than 4 o'clock in the afternoon of Monday, the 14th October next.

Persons tendering must in the case of all workmen employed by them in and about the execution of the contract, pay wages at not less, and observe hours of labour not greater, than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed. No Tender will be received unless it be made upon one of the forms provided for the purpose. The Council does not pledge itself to accept the lowest or any Tender. If required, the contractor must provide two sureties for the due execution of the contract.

D. A. NICHOLL,
Town Clerk.

Council House,
Wandsworth, S.W.
September 25, 1912.

METROPOLITAN BOROUGH OF ISLINGTON.

Wanted, in the Borough Engineer and Surveyor's Department, an Assistant. Must have had experience in the office of an Engineer and Surveyor, and be able to survey, level, and prepare plans. Selected candidates will be examined as to their professional knowledge.

Salary to commence at £90 per annum, rising by annual increments of £7 10s. to £120 per annum.

Applications, in the handwriting of the candidates, stating age, present employment and past experience, accompanied by copies of not more than three testimonials of recent date, and endorsed "Engineer's Assistant," must be received by the undersigned not later than 12 noon on Tuesday, the 8th October, 1912.

WM. F. DEWEY,
Town Clerk.

Town Hall, Upper-street,
Islington, N.
September, 1912

SURVEYOR and ARCHITECT, Junior Assistant, re-engagement required; working and detail drawings; good draughtsman; well up in surveying, levelling, and assist quantities; first-class testimonials; moderate salary.—G. R. G., office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

SINGAPORE, STRAITS SETTLEMENTS. MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant, under 32 years of age, and of sound constitution, chiefly for their new sewage scheme. He must have received a good technical education, a regular training as a Civil Engineer, and including a practical knowledge of surveying, levelling and estimating. He must also have had special experience in designing and constructing sewerage and sewage disposal works and waterworks, and their maintenance. Preference will be given, other things being equal, to applicants who have passed the Examination of the Institution of Civil Engineers—Associate Members—or that of the Institution of Municipal and County Engineers. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out. The salary will be 350 dollars per month, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Such local transport allowance as may from time to time be sanctioned by the Commissioners will be paid. Applications, stating age and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 8th October next.

METROPOLITAN BOROUGH OF STOKE NEWINGTON.

TENDERS FOR CREOSOTED DEAL PAVING.

The Council of the above Borough invites Tenders for Supplying and Laying 4-inch Creosoted Deal Blocks, and for all Works in connection with the Concrete Foundation in Lordship Park.

Specification and Form of Tender may be obtained on application to the Borough Surveyor.

Tenders, endorsed "Tender for Wood Paving, Lordship Park," to be delivered to the undersigned not later than 4 o'clock p.m. on Tuesday, 8th October, 1912.

The Council does not bind itself to accept the lowest or any Tender.

GEORGE WEBB,
Town Clerk.

Town Hall,
Milton-road,
Stoke Newington, N.

CITY OF MANCHESTER.

The Rivers Committee invite applications for the position of Outdoor Engineering Assistant on the Main Drainage Works. Salary £200 per annum.

Applications, in writing, stating experience, with copies of three recent testimonials, to be sent to the Chairman of the Rivers Committee, Town Hall, Manchester, not later than 10 a.m. on Saturday, the 5th October, 1912. Canvassing, directly or indirectly, will be a disqualification.

THOMAS HUDSON,
Town Clerk.

Rivers Department.
September 25, 1912.

SUPPLY OF CAST-IRON PIPES OR STEEL TUBES.

Alternative Tenders are invited for the Supply of about 50 lineal yards of 15-in. diameter Vertically Cast-Iron Pipes, Bank Pipes, or Steel Tubes. For full particulars apply W. Quest, Surveyor, Town Hall, Wombwell. Tenders, endorsed "Tenders for Pipes," to be delivered to P. M. Walker, Esq., Town Hall, Wombwell, on or before Tuesday, the 8th prox., at 5 o'clock.

P. M. WALKER,
Clerk to Council.

ASSISTANT, 7 years' experience municipal office, seeks appointment, surveyor, leveller, good draughtsman; excellent credentials, and experience roads, water supply, sewerage and sewage disposal, private street work, buildings, &c.—Wilson, 14 Belgrave-avenue, Victoria Park, Manchester.

Institution of Water Engineers.

VISIT TO LLWYN-ON RESERVOIR WORKS (CARDIFF CORPORATION).

On Saturday last, the 21st inst., a party of members of the Institution of Water Engineers, numbering in all about forty, paid a visit to the Llwyn-on reservoir works now being carried out by the Cardiff Corporation to the designs and under the supervision of Mr. Chas. H. Priestley, M.INST.C.E. (past-president of the institution), in the Cwm Taff Valley some 30 miles from the city. The appended description of the works by Mr. Priestley will give all the important details of the scheme, but the interest of the visit was greatly enhanced by the fact that it took place at a most interesting stage in the progress of the undertaking.

The party assembled in force at the terminus of the contractors' railway at Cefn, 1 mile out of Merthyr Tydfil, and were first conveyed to the stone quarries from which the materials required for the construction of the dam are obtained. These having been inspected under the guide of the contractors' agent, Mr. Buchner, the party were conveyed to the works, where, in addition to Mr. Priestley himself, the visitors had the chief resident engineer (Mr. H. W. B. Cotterill, ASSOC.M.INST.C.E.) and his staff of assistants to act as guides, and supply all information asked for.

Having inspected the screening chamber, the most advanced part of the permanent works, and the concrete-mixing machine (in operation), most of the party went down the trench and were able to inspect the face of the excavation so far as the timbering allowed, and particularly the nature of the rock forming the watertight base of the whole structure. The engineer was congratulated upon the very favourable character of the strata, and the important and hearing power nature of the rock, which represented such important features in the successful and economical carrying out of the scheme. Concreting was in progress, and the excellence of the materials, design and workmanship was the subject of general comment. Returning to the surface, the members then inspected the temporary timber channels carrying the stream across the trench, and were able to appreciate the strain put upon this during the heavy rains in August last, when the water rose to within a few inches of the top of the channel timbers. The permanent discharge tunnel was then seen under construction, and the large dimensions and the solid nature of the lining were both commented on. Climbing the hill to the engineer's offices, the members were invited to inspect the plans of the work and a fine model showing a section of the embankment.

At this stage the programme announced the provision of lunch, but, owing to some misunderstanding on the part of the caterers, this proved to have gone astray, and the chief engineer and his staff were faced with a problem which for novelty and unexpectedness was quite equal to many met with in the course of their normal duties. In solving this, however, they proved their ability to "direct the forces of Nature for the use and convenience of man," and a very welcome and sufficient makeshift meal was quickly forthcoming. The members then drove up the valley to the Cantreff reservoir, completed in 1892, which afforded a striking contrast with the Llwyn-on reservoir in its present condition. Returning to the engineer's offices, the luncheon previously missing was found to be waiting attention, and this having been disposed of the president (Mr. J. S. Pickering, M.INST.C.E., borough and water engineer of Cheltenham) took the opportunity of expressing thanks and congratulations to Mr. Priestley, to the Water Committee of the Cardiff Corporation represented by the chairman, Alderman W. P. Bird, J.P., and to the engineer's staff, for the unusually favourable opportunity afforded to those present of inspecting such a fine example of modern reservoir embankment work.

The weather being exceptionally fine, in pleasant contrast to the occasion when the association visited the Beacons and Cantreff reservoirs in 1900) the members were able to inspect the works, and to appreciate the natural beauties of the Taff Valley under the most favourable conditions, and all present will retain pleasant recollections of a most successful function.

The council of the institution are contemplating the arrangement of other visits of this nature between the usual half-yearly meetings, and the success of this visit will no doubt afford them encouragement in repeating the experiment.

THE "LLWYN-ON" RESERVOIR.

By CHAS. H. PRIESTLEY, M.INST.C.E.,
City Water Engineer, Cardiff.

Under the Cardiff Corporation Act of 1884, powers were obtained for the construction of three reservoirs in the Taff Fawr Valley in Brecknockshire, over 30 miles distant, for the supply of the town and compulsory area. This was an entirely new source of supply, determined upon after careful consideration by the council, upon full and exhaustive reports prepared by their engineer, Mr. J. A. B. Williams, M.INST.C.E., who had been instructed to examine all available sources which would be likely to give a pure, ample and sufficient supply for the fast-growing needs of the district, the existing sources being insufficient to meet increasing demands, and also of somewhat doubtful quality.

The "Cantreff," or No. 2, reservoir was first constructed and opened in the year 1892, the aqueduct to Cardiff having been laid in the meantime. The "Beacons," or No. 1, reservoir was then built and opened in the year 1897.

From the time the Cantreff reservoir was put into operation, water from the Taff Fawr source was conveyed to the storage reservoirs near Cardiff and supplied after filtration throughout the district. The requirements of the city and district of supply continued to increase, and reports were made showing the necessity of constructing the third reservoir of the series in the Taff Fawr Valley, but a long continuation of wet summers did not bring home to the council the urgency of being prepared for a prolonged drought, and it was not until after the author had presented to the council, at the request of the Waterworks Committee, an exhaustive report in the spring of 1908, that any active steps were taken to proceed with the further reservoir, the last of the series authorised under the scheme sanctioned in 1884. After full discussion and consideration of a number of alternative schemes, the report above mentioned was adopted by the council in the autumn of 1908, and instructions given to proceed with the Parliamentary deposits and prepare a Bill for the session of 1909.

Although sanction had been obtained for a reservoir on the site of "Llwyn-on" under the Act of 1884, and a certain portion of the land had been purchased for it, it was deemed desirable, having regard to the favourable character of the site, considerably to enlarge the capacity of the reservoir; the borrowing powers having also been exhausted, it was necessary to go to Parliament for further sanction, which was obtained, after considerable opposition, by the Act of 1909.

The "Llwyn-on" reservoir is being constructed of the full capacity and size allowed under the Act.

AN UNUSUAL CLAUSE.

It may be of interest to mention that by the Act of 1884, confirmed by the Act of 1909, a somewhat unusual clause was inserted. Before proceeding with the making of any of the reservoirs, notice had to be given to the Board of Trade, accompanied by drawings and specifications of the proposed works, a copy being deposited in the office of the town clerk; notice had also to be given to the Merthyr Corporation and a number of the other riparian owners. These drawings and specifications were to be open to inspection by the parties interested, who had the right to make objection to the proposed materials or mode of construction or any part thereof to the Board of Trade, who, after due consideration, might alter or amend the same if they thought fit. In this instance no objections were lodged with the Board of Trade, but before approving thereof the board instructed a well-known firm of independent engineers to make an inspection of the site, and to examine the plans and specification, making such suggestions as they thought desirable in connection therewith. One or two slight modifications were suggested with regard to the specification, but no alterations whatever were made in the plans. The amendments were accepted, after which the Board of Trade gave their formal approval.

The principal dimensions of the reservoir are given herewith:—

DIMENSIONS OF RESERVOIRS.

—	No. 1, or "Beacons," reservoir.	No. 2, or "Cantreff," reservoir.	No. 3, or "Llwyn-on," reservoir (in construction).
	a. r. p.	a. r. p.	
Water area T.W.	51 2 34	42 3 17	144 acres
T.W. level above O.D. ...	1,340 ft.	1,073 ft	854 ft.
Greatest depth of water for compensation and supply	54 ft.	73 ft.	63 ft.
Length of embankment from side to side of valley	1,200 ft.	600 ft.	1,200 ft.
Height from bed of river	65 ft.	90 ft.	81 ft.
Greatest width at base ...	400 ft.	600 ft.	500 ft.
Width at top	30 ft.	30 ft.	8 ft.
Inside diameter of discharge tunnel	10 ft.	13 ft.	16 ft.
Length of tunnel	530 ft.	580 ft.	520 ft.
Length of overflow weir	160 ft.	160 ft.	300 ft.
Width of by-wash ...	20 ft.	30 ft.	50 ft.
Capacity of reservoir ...	345 mil. gal.	323 mil. gal.	over 1,200 mil. gal.
Drainage area	2,000 ac.	2,000 ac.	6,400 ac.

Height of watershed, 2,910 ft. above O.D. at Brecon Beacons.

The reservoir is situate about 5 miles north of the county borough of Merthyr Tydfil, Brecknockshire, well above the outcrop of the mountain limestone and in the old red sandstone formation. The gathering ground comprises 10,400 acres of land, reaching to the foot of the Brecon Beacons, the highest mountains in South Wales. The amount of compensation water to be discharged daily to the river Taff Fawr on the completion of this reservoir will be at the rate of 861 cub. ft. of water per minute (approximately 7,750,000 gallons daily). This quantity was fixed by the Act of 1884, and no alteration made therein under the Act of 1909.

The average rainfall on the gathering ground varies from 76·96 in. at the "Beacons" reservoir to 60·31 in. at the "Llwyn-on" reservoir. The highest register at the "Beacons" reservoir was in 1903, being 113·16 in.

The contract for the construction of the "Llwyn-on" reservoir was let in November, 1910, to Mr. Louis P. Nott, of Bristol, the amount being £201,077. This did not, of course, include the purchase of land, road diversions, removal and rebuilding chapel and other contingencies in connection with the work, all of which are additional thereto.

The contractor's railway from the Cefn station of the Brecon and Merthyr line was first put in order for the conveyance of plant and material to the site of the works. The excavation of the trench and other parts of the reservoir actively commenced in the spring of last year, and considerable progress has been made since that date.

The corporation have erected offices, staff quarters, mission room, school for the children of the employees, &c., the contractor under the terms of the specification building huts for the housing of a number of the men employed upon the works, with offices, &c.

The time for the completion of the whole of the works under the contract is December 31, 1916, subject to any period which may be allowed by the engineer for unforeseen circumstances that may arise during construction.

Tramways in the City of London.—The Corporation of the City of London have received a letter from the London County Council stating that it has been decided to renew in the next Session of Parliament the application for authority to extend the existing tramways in Farringdon-street as far as Ludgate-circus, and expressing a hope that the corporation will co-operate by giving the consent required by the Standing Orders to enable the council's bill to be proceeded with.

A Remarkable Recovery. Ten years ago (the *Surrey Comet* reports) a well-known professional gentleman, still residing in Hampton, accidentally dropped his gold-framed spectacles down a sewer manhole which he was inspecting. The spectacles were in a case, but the lid was open. He was informed by one of the district council officials that they would be found in due course at the disposal works. In a few days the case turned up there, but minus the spectacles. A fortnight ago the latter were recovered at the same place, and although the lenses were lightly scratched the frame was in the main intact, in spite of its long immersion in the sewer.

DAMAGE TO ROADS BY MOTOR 'BUSES.

CONFERENCE OF LOCAL AUTHORITIES.

The increasing cost of road maintenance as a result of heavy motor traffic was the subject of an important conference held at Richmond on Thursday, the 19th inst. All the local authorities on the western fringe of London were invited, and twenty-three were represented, in addition to the county councils of Surrey and Middlesex. The delegates numbered nearly 100, among those present being Messrs. H. T. Wakelam, county engineer, Middlesex; E. F. Morgan, borough surveyor of Croydon; R. H. Clucas, borough surveyor of Kingston-on-Thames; C. H. Cooper, borough engineer of Wimbledon; J. H. Brierley, borough surveyor of Richmond; C. Jones, borough engineer of Ealing; J. Stevenson, surveyor to the East and West Molesey Urban District Council; H. C. Fread, surveyor to the Esher and the Dittons Urban District Council; S. H. Chambers, surveyor to the Hampton Urban District Council; R. W. Hindhaugh, surveyor to the Ham Urban District Council; P. Taylor, surveyor to the Hampton Wick Urban District Council; R. H. Jeffes, surveyor to the Maldens and Coombe Urban District Council; H. Mather, surveyor to the Surbiton Urban District Council; M. Hainsworth, surveyor to the Teddington Urban District Council; and F. W. Pearce, surveyor to the Twickenham Urban District Council.

Alderman R. W. SIMPSON, J.P. (Mayor of Richmond), presided over the gathering. In opening the proceedings the roads, he said, had never been made for heavy motor 'buses, and they desired an equitable share of the petrol tax or powers to license for local and highway purposes heavy omnibuses, with powers to regulate their speed, and to define the routes which the 'buses used. The Road Board should disgorge the £2,000,000 they appeared to be hoarding for some purpose. Last year it cost Richmond a 1d. rate over the ordinary rate in order to keep the roads in fair order, and they were spending £20,000 on wood paving in one particular road. While that was being done they found that other roads were requiring to be put in order, and a large sum of money would have to be spent. The 'buses were shaking the foundations of houses, and there were bitter complaints of injury to health and damage to property. Although motor-'bus traffic was comparatively recent in Richmond, a census taken on the previous Sunday showed that 1,646 motor vehicles passed a given spot, and of these 919 were motor 'buses.

The first resolution, moved by Alderman EDGAR (Richmond), was that, in view of the enormously increased cost of road maintenance due to heavy motor traffic, those conducting such traffic should contribute substantially. At present, he said, motor 'buses paid nothing to local rates except where garages were situated. He pointed out that the Road Board had a large sum of money in their possession, but not a cent was given for ordinary road maintenance; they were hoarding it in order to make great roads to Brighton and the West.

In the course of the discussion Mr. J. J. BISCOOE (Richmond) said that every mile travelled by a motor 'bus paid three-fourteenths of a 1d. tax, and the sum was not adequate, nor would it pay half the cost of road repair. Each 'bus earned £1 16s. 8d. per day, or £540 nett profit a year for the company, on a capital outlay not exceeding £400, so that they could well afford to pay more.

The MAYOR OF KINGSTON, in supporting the resolution, advocated some restriction in the case of the heavy traction motors, which, he believed, were capable of causing even more damage to the roads than the 'buses. The traffic of these huge engines was much on the increase.

Alderman EDGAR disclaimed anything like hostility to the motor 'buses, but it seemed that they were practically running at less than cost price, while non-passengers and those who positively objected to them had to pay what should be included in the fares.

The resolution was carried.

Approval was also given to a resolution: "That a proviso be introduced into next year's Finance Act that in future the proceeds of the petrol tax or any other charges levied in connection with 'buses be returned to the local authorities in proportion to the use made of the roads."

Mr. H. J. SAUNDERS, clerk to the Twickenham Urban District Council, the mover, said he followed other speakers in his views on Road Board policy, which was certainly not to make any grant for road mainten-

ance. He pointed out that the tramway companies constructed a large portion of the roads they travelled over, and paid considerable sums to the rates, and if the 'bus owners contributed towards the upkeep of a quarter of the road area the local authorities would no doubt be content.

THE QUESTION OF ROUTES.

A third resolution, which was also carried, suggested that local authorities should be given power, subject to appeal to the Local Government Board, to limit and define the routes to be taken by motor 'buses in the districts surrounding the metropolis and other large trade centres. It was pointed out that as things were at present the companies could select the shortest and most remunerative routes without any regard to the nature of the road or the wishes of the inhabitants. Another thing to be considered was that many local authorities were preparing town planning schemes under which roads were to be graded. Roads in purely residential parts were to be of lighter construction, but if motor 'buses were to be allowed along such roads the work of the local authorities would be rendered of no account.

Mr. J. H. Salmons, clerk to the Teddington Urban District Council, expressed the view that it would be more reasonable to have a central tribunal, and not leave the matter in the hands of the local authorities.

Mr. C. H. Cooper, borough engineer of Wimbledon, said it was erroneous to state that the Road Board had £2,000,000 in its possession; all it had to deal with was £633,000, and it had done very well with it. He pointed out also that in many localities the authorities owned the tramways, and it was hardly fair for them to legislate for owners of the 'buses.

Mr. H. T. Wakelam, county engineer of Middlesex, suggested that the word "local" should be left out of the resolution and "highway" substituted, but the mover of the resolution replied that he had given this matter a good deal of consideration, and preferred to have in the word "local," as he felt that it included all authorities.

The resolution was carried unanimously.

WEIGHTS OF MOTOR VEHICLES.

The final resolution, moved by Councillor Bisgood (Richmond), was as follows: "That the weight on each wheel and the speed of heavy motor vehicles are excessive, and should be subjected to stringent restrictions; and further, that the speed should be kept within the legal limit of twelve miles an hour by mechanical means." Councillor Bisgood said that what they wanted to put before the conference was that there was no road surveyor and no borough engineer who could make a road to withstand the impact of the rear wheels of motor 'buses as at present designed. He had taken the trouble to have the figures calculated by a very eminent engineer, and it came to this: each rear wheel of a motor 'bus was carrying 2½ tons of dead weight when the 'bus was loaded to its capacity. The front wheels carried very little weight, and the reason was that Mr. Beaumont, the technical adviser to the Commissioner of Police, said that they must put added strength in the rear wheels, as a disaster to the rear wheels was a more serious matter than disaster to the front wheels. The dead weight when the vehicle was at rest was 2½ tons per wheel, but when the vehicle began to move at a speed of 5 miles an hour there was added to that weight the pressure due to the momentum, which increased the weight to 3 tons a wheel. At 10 miles an hour the weight was 4¼ tons a wheel, and at 15 miles—the average speed of motor 'buses—the pressure per rear wheel was 7 tons. That was equivalent to a blow on the road surface of 7 tons, and he was told that to make a road to stand a pressure of 7 tons required 22 in. of concrete and wood, or other material. It was not right and fair to expect the ratepayers to construct such roads. He felt that this was the true basis, and unless they could get a limitation of the blow, no pavement could compensate an authority for the damage.

The resolution was passed.

At the suggestion of the chairman it was decided that each council should appoint a delegate to an executive committee to urge the Government to consider the demands of the conference.

ACTION BY BOROUGH COUNCILS.

The General Purposes Committee of Kensington Borough Council are about to challenge the right of persons to use the streets for heavy and noisy motor traffic. The council have been receiving complaints for some time of the annoyance caused by motor omnibuses and other heavy motor vehicles, and the committee have now given instructions to its solicitors to take proceedings against offenders.

A notice of motion with reference to motor traffic appeared on the agenda for last Wednesday's meeting of Wandsworth Borough Council. It expressed concern about the falling receipts of the London County Council tramways owing to motor omnibus competition, and urged the London County Council to endeavour to obtain power to prohibit the use of any roads in the County of London by motor omnibuses without the joint consent of the governing bodies—the London County Council and the borough councils concerned.

SEWAGE EFFLUENT STERILISATION AT POLK STATE, PENNSYLVANIA.

A scheme for the purification and sterilisation of 564,000 gallons of sewage daily is described in the *Engineering Record*. The works are designed for the Pennsylvania Institution for Feeble-minded at Polk. They consist of settling tanks, sprinkling filters, humus tanks, dosing apparatus for treating the effluent with hypochlorite of lime, and a straining filter for sludge from the various units. The sewage is first screened, and then passes into the settling tanks. Each tank consists of four departments, and they are of such a size that with three tanks in use a settling period of twelve hours is given. These tanks are constructed of reinforced concrete, and are roofed with the same material.

The filters are filled with broken sandstone of a grade of from ¼ in. to 1 in. They are 6 ft. deep, and are capable of dealing with the sewage at a rate of about 200 gallons per cubic yard per day.

The humus tanks consist of two rectangular compartments, one to each filter, having an average width of 30 ft., an average length of 52 ft., and an average depth of 4 ft. Each has a capacity of 47,000 gallons, or holds two hours' flow.

The sludge bed is 135 ft. long by 100 ft. wide by 2 ft. deep. It is filled with coarse sand. It will be observed that the area allowed for the sludge bed is in the proportion of about 1 sq. yd. for every 350 gallons of the daily flow. The liquid from the sludge bed is pumped into the settling tanks for further treatment. It is not clear from the description given whether the sterilising agent is added to the effluent while it is in the humus tanks or later. The effluent is sterilised by means of chemical hypochlorite.

Institute of Sanitary Engineers.—The opening sessional meeting of this body will take place at Caxton Hall, Westminster, on Wednesday, October 2nd, at 8 p.m.

Workmen's Cottages.—In last week's issue there appeared an inquiry from a correspondent for the names of any medium-sized towns (say of between 15,000 and 20,000 inhabitants) where cottages for the working classes have been erected by the local authorities. In reply to this Mr. Percival T. Harrison, Assoc.M.Inst.C.E., borough engineer of Chelmsford, writes: "This council is completing thirty-eight cottages, and have decided to erect a further 105. The population of Chelmsford is nearly 24,000."

Dusseldorf City-Planning Exhibition.—Although the congress arranged on city planning concludes to-morrow, the exhibition on that subject and on city operation and city administration functions remains open to October 31st. The first group of exhibits in connection with it consists of general ground plans, traffic systems (such as railways; local and express facilities; elevated, subway, suspension and street railways), aviation stations, city embellishment, bridges, docks, parks, lawns, forests and real estate polities. Under city operation are grouped: Gasworks, waterworks, electric central-stations, sewage systems, street cleaning, refuse disposal, cemeteries and crematories. Under the third group (administrative functions) are exhibited plans and models of hospitals, rescue homes, poor-houses, lodging-houses, orphan asylums, homes for widows and the aged infirm, schools, churches, museums, art galleries, libraries, concert halls, &c. Dusseldorf, known as the "Park City," is the most modern city in western Germany, the centre of the industrial empire, and reputed to be the most beautiful city.

CHLORINE OR HYPOCHLORITES?

By Eric K. Rideal.

At the present time, when many waters are being treated with electrolytic bleach, with bleaching powder, or with magnesium hypochlorites, in order to produce a sterile water supply, it is important to investigate whether the purifying agency of the added substance is chlorine or not. For if it is chlorine that is the potent germicide in the water we have at first to investigate the action of dilute chlorine water on the human system, for which the water is intended, and, secondly, to discuss whether chlorine gas *per se* would not be a more economical form of treatment.

Pettenkofer and Lehmann say that 1 to 5 parts of "free" chlorine per 100,000 parts of air affect the respiratory organs, while 6 parts per 10,000 soon prove fatal. Koch also spoke firmly against the use of free chlorine, showing that it was poisonous in a similar manner to bromine and iodine, two other well-known halogens.

Various authors from time to time have shown that chlorine itself in the gaseous state forms only a fair disinfecting or sterilising medium, while solutions of bleach are comparatively strong, strengths such as 1 to 5 parts of "available" chlorine per 1,000,000 usually sufficing to sterilise contaminated waters. The differences noticed between these two "chlorine" disinfectants are accounted for by their different mode of working. The action of chlorine on water containing traces of organic matter and also organisms is threefold.

A part of the chlorine attacks the organic matter and liberates substituted chloramines; these, as my father has shown, are very strong germicides, and are consequently of great utility in the water. Some of the chlorine acts directly on the organisms as a toxic agent, while the greater part of the chlorine (in the case of a water that does not contain large quantities of organic matter) is only slowly decomposed by the water into hydrochloric and hypochlorous acids. This occurs more rapidly under the influence of light.

Since hydrochloric acid is a strong acid, it will replace the carbonic acid in the carbonates that are probably already present in the water, setting free carbonic acid at the same time. If, on the other hand, the quantity of carbonates in the water is low, such as is the case in very soft waters, the hydrochloric acid formed by the chlorine will give the water a marked acidity, which, in course of time, will affect the water conduits and pipes. The hypochlorous acid remains free and liberates oxygen when in contact with organic matter.

This hypochlorous acid is a strong disinfectant and steriliser, it possesses the advantage shared only by ozone and the peroxides (including nascent hydrogen peroxide liberated from the "per" salts)—namely, that it only liberates oxygen in the nascent state.

In the case of hypochlorites, such as bleaching powder or electrolytic hypochlorites of sodium or magnesium, the only salts in solution are, firstly, neutral chlorides, that at such dilutions possess no physiological action whatever. The effect of adding calcium or magnesium hypochlorites to a hard water will be merely to increase slightly the hardness of that water. This may be obviated by using electrolytic sodium hypochlorite, which will not increase the hardness, but, in certain cases, will, in fact, soften it.

Secondly, calcium or sodium hypochlorite; these, if treated with strong acids, will liberate chlorine, which, as has already been shown, possesses marked toxic properties. If, however, they are treated with dilute weak acids (such as carbonic or humic), they liberate hypochlorous acid. This substance will sterilise the water by means of its oxygen liberating capacity. Thus, sterilising by hypochlorites in normal waters, which contain free carbonic acid, is equivalent to sterilising by means of oxygen, the mere traces of chlorine that may be evolved are at once fixed by the substituted ammonias of the organic matter to form chloramines. There is at no time in the water a large quantity of free chlorine, as is the case in waters which have been treated with chlorine water.

Again, it is to be remembered, when the suggestion of treating water supplies with chlorine or hypochlorites is made, that one has to face the possibility of an overdose occurring through some accident or neglect. In the case of the chlorine treatment, the effect might prove disastrous, while with hypochlorites a slight increase in the salinity of the water would be the only result.

Another point in favour of the hypochlorite treatment, whether the hypochlorites of sodium, magnesium or calcium be used, is that the crude chemicals do not exert that powerful destructive effect both on the human system and on the vessels with which they come in contact, which is the characteristic of the halogens. Very special precautions, indeed, would be required if liquid chlorine in bombs were to be used as a disinfectant for waters or effluents.

Although the price of chlorine falls considerably below the market value of any form of hypochlorites, from these considerations it may be perceived that the employment of free chlorine for water supplies has its grave disadvantages, which are not shared by the hypochlorite treatment.

Vacuum Cleaning Extraordinary.—A machine combining two modern inventions, the electric car and the vacuum cleaning apparatus, has been applied in Strassburg to clean the tramway tracks of that city. In the operation of the machine the road bed is sprayed with water, then the dirt is loosened by a scratcher and drawn up into the car by the suction apparatus. With this machine (says *Scientific American*) one man can clean 25 miles of track a day, replacing the labour of seventeen men working in the ordinary way.

Whinstone Setts and Portsmouth.—At a recent meeting of the Portsmouth Corporation, in the course of a discussion on the expenses of "a flying squadron" of aldermen and others which visited Leicester, Croydon, Southend, Southampton, and Cheltenham in quest of setts which will not become slippery under wear, it transpired that whinstone setts were decided upon, and duly laid. It was stated that "whinstone, as it is called, is quarried in Scotland. It is hard, almost like granite, and has been dressed with a level surface, but it would not wear smooth so as to be slippery in wet weather."

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

EAST MIDLAND DISTRICT MEETING AT ILKESTON.

District Chairman—Mr. E. G. Mawbey, M.Inst.C.E., Leicester.

An East Midland District meeting will be held at the Town Hall, Ilkeston, to-morrow (Saturday).

Programme.

10.45 a.m.—Reception by the mayor, Councillor S. Shaw, J.P., at the town hall.

11 a.m.—Special cars to Hallam Fields for Stanton Ironworks.

11.30 a.m.—Visit Stanton Ironworks.

1 p.m.—Lunch (kindly provided by the company) at the Stanton Ironworks Company's Hotel.

1.45 to 2.30 p.m.—Formation of District Executive Committee. Discussion on papers (which will be taken as read): "Ilkeston Sewage Disposal Works," by Mr. H. P. Raikes, engineer; "Twenty-eight Years' Municipal Work at Ilkeston," by Mr. H. J. Kilford, borough surveyor; "Ilkeston Tramways and Electricity Supply," by Mr. H. P. Stokes, borough electrical engineer.

3 to 4 p.m.—Inspection of the new sewage disposal works. The party will be conducted over the works by the engineer, Mr. H. P. Raikes.

4.10 p.m.—Special cars to the town hall, where tea will be provided.

Should time permit, a visit will be paid to the car sheds, police station, free library, cemetery chapels, lodges, gasworks, &c.

R. A. MacBrair, M.Inst.C.E.,
Hon. District Secretary,
Lincoln. City Engineer.

EXAMINATION.

The October, 1912, examination will be held in Birmingham on the 10th, 11th and 12th of that month.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, assoc.m.inst.c.e., Borough Surveyor, Windsor.

President-Elect—Mr. Frank Latham, m.inst.c.e.i., f.s.e., Borough Engineer and Surveyor, Penzance.

ANNUAL GENERAL MEETING.

The fourth annual general meeting of the Institution of Municipal Engineers will be held in London on Friday and Saturday, October 11th and 12th next.

Programme.

Friday, October 11th.

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.

11.15 a.m.—Annual general meeting:—
Minutes of last meeting.
Election of council for the year 1912-13.
Presentation of annual report of council.
Announcement of result of ballot.
Presidential address.

1 p.m.—Adjourn for lunch.

2 p.m.—Reassemble in council chamber.

2.15 p.m.—Discussion on the following papers to be presented to the meeting:—
"The Modernising of Building By-laws," by F. W. Platt (member).
"The L.G.B. Report on Intercepting Traps," by H. C. H. Shenton (member).
"The Influence of Town Planning upon the Public Health," by W. Louis Carr (member).
"Superannuation and Security of Tenure," by A. Winter Gray (Member).

(The papers will be taken as read, and advance copies may be obtained on application to the secretary, and will be forwarded as soon as the papers are in print.)

5 p.m.—Close of meeting. Ladies return to council chamber.

Ladies' Meeting.

(Held concurrently with General Meeting.)

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.

11.15 a.m.—Leave council chamber and proceed to the stores of Messrs. Selfridge & Co., Oxford-street, W.

11.30 a.m.—Meet at the Duke-street entrance of the stores, where visitors will be met by a representative of the firm and conducted round the building.

1 p.m. Lunch.

2.30 p.m.—Meet at the showrooms of Messrs. Doulton & Co., Limited, Lambeth, S.E., who have kindly arranged to conduct the visitors through their works and showrooms.

4.30 p.m.—Leave Messrs. Doulton's works.

5 p.m.—Arrive at council chamber, Southampton-row.

6.45 p.m.—Reception by the president at the Holborn Restaurant, followed by (7 p.m. to 11.30 p.m.) social evening, with musical programme, at the invitation of the president. Morning dress.

Saturday, October 12th.

10.30 a.m.—Visit to Shakespeare's England, Earl's Court. Meet in booking hall, Earl's Court Station.

12.30 p.m.—Adjourn for lunch.

2.30 p.m.—Visit to the London Hippodrome, at the request of a number of country members.

EASTERN DISTRICT MEETING, CODMANCHESTER.

(Tuesday, October 15th.)

Programme.

11.30 a.m. Meet at Godmanchester Station and inspect Roeman road.

12.30 p.m.—Call at council's depot, where methods of sewer flushing will be shown.
Inspect reinforced concrete bridges.

1 p.m. Lunch at the Horseshoe Temperance Hotel.

2 p.m. Reception at the town hall by his Worship the Mayor (Mr. J. P. L. Durrell Stables, J.P.).
Inspect old charters, books and records.

3 p.m.—Walk round town, viewing sixteenth century architecture, tarviated roads, reinforced concrete posts, new system of constructing cheap cottages and "exhibition" of cheap cottages.

4 p.m.—Tea at the Horseshoe Temperance Hotel.

Philip S. Bennett,
Hon. District Secretary.

Council Offices,
Ramsey, Hunts.

NORTHERN DISTRICT.

At a meeting of this district, held at the Town Hall, Newcastle-on-Tyne, on Saturday last, arrangements were made for holding a joint meeting with the Yorkshire District at Harrogate on October 19th. Full programme of the meeting will be announced later, and at the meeting the question of the partition of Yorkshire among the neighbouring districts will be brought up for discussion.

COUNCIL MEETING.

At a meeting of the Council held on September 18th the following applicants were recommended for admission.

To Membership: Messrs. R. L. Price, surveyor, Dawley Urban District Council; T. Robinson, surveyor, Southport, Birkdale and West Lancashire Water Board; and H. Plewes, surveyor, Thorne Rural District Council.

To Associate Membership: Messrs. S. F. Deacon, chief assistant, St. Mellons Rural District Council; R. E. Miles, assistant engineer and surveyor, Horbury Urban District Council; H. E. Morris, surveyor's office, Hendon Rural District Council; F. J. Felts, borough surveyor's office, Cambridge; and G. H. Thomas, assistant surveyor, Llanelly Urban District Council.

Transfer to Membership: Messrs. F. Britton, surveyor, Dore Rural District Council, and G. E. Mathews, engineer and surveyor, South Holland Drainage Trust.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

New Members, &c.—From the applicants recommended for admission at the last meeting four members and seven associate members were elected, and one transfer was made to the membership class.

International Road Congress, 1913.—The secretary reported that the president of the institution had been added to the list of honorary vice-presidents of the congress.

Annual Meeting.—The programme of the annual meeting to be held on October 11th and 12th was finally approved.

N.A.L.G.O. Dinner.—The annual dinner of this association is to be held in London on October 12th. Full particulars may be obtained of the secretary.

Subscriptions, 1912-13.—Members and others are requested to note that annual subscriptions for 1912-13 are now due.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ASSOCIATION OF KENT SURVEYORS.

MEETING AT TONBRIDGE.

A meeting of the Association of Kent Surveyors was held at Tonbridge on the 14th inst., the following being present—namely: Messrs. H. P. Maybury (chairman, Kent), A. E. Nichols (vice-chairman, Folkestone), G. A. Butterworth (Birchington), T. A. Busbridge (Maidstone), J. Randerson (Sevenoaks Rural), J. Marshall (Malling Rural), J. L. Redfern (Gillingham), S. Towlson (Sevenoaks), W. L. C. Turner (Tenterden), A. Goldfinch (Whitstable), W. L. Bradley (Tonbridge), W. G. Cross (Tunbridge Wells) and Frank Harris (hon. secretary and treasurer, Tonbridge Rural).

The members were welcomed to Tonbridge by the chairman of the Tonbridge Urban District Council, Mr. L. J. Breeze, J.P., and visits were afterwards paid to various works in the neighbourhood, these including a tarviated granite road in the High-street, and the newly completed sewage works with electric pumping plant.

It was decided to hold the next meeting in London.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

President—Mr. JOHN D. WATSON, M.INST.C.E., F.R.S.I.

METROPOLITAN DISTRICT MEETING.

An inspection of the St. Albans sewage disposal works will be made by the members of the Association of Managers of Sewage Disposal Works to-morrow (Saturday), at 2 p.m.

The works comprise sedimentation tanks, sludge receiver, sludge distributing main, coarse contact beds, percolating filters, Fiddian travelling distributors, humus tank, final land treatment, &c. The pumping plant comprises a Teasdale suction-gas plant, two 12 h.p. gas engines, and two 6-in. centrifugal pumps.

PROGRAMME.

Assemble at entrance to works near Park-street Station (L. and N.W. Rly.).

The party will be conducted over the works by Mr. A. Eade, the manager, who will explain the system of treatment.

A paper will be read by Mr. H. Howard Humphreys, Westminster.

His Worship the Mayor and other members of the corporation have promised to be present.

JAS. CRAIG,
Hon. District Secretary.

68 Empress-avenue,
Manor Park, E.

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, LEWES.

At a meeting of the Royal Sanitary Institute, to be held at the Town Hall, Lewes, on Friday, October 4th, at 7 p.m., Mr. D. Roberts, the borough surveyor of that town, will open a discussion on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams," among those who are expected to take part in the proceedings being Messrs. John H. Blizard, ASSOC.M.INST.C.E., Southampton, A. J. Martin, M.INST.C.E., Westminster, and A. E. Prescott, borough engineer and surveyor, Eastbourne.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute.

On the following morning the members will visit the Phœnix Ironworks and the Lewes Portland Cement and Lime works, and in the afternoon inspect the Lewes Victoria Hospital, the borough isolation hospital, the fire brigade station, and the waterworks.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday, October 7th, at the Institution of Electrical Engineers, Victoria Embankment, W.C. (south end of Savoy-street, near Waterloo Bridge), a paper on "Town Planning from an Engineering Aspect" will be read by Mr. E. R. Matthews, ASSOC.M.INST.C.E., F.G.S., the following being a synopsis: Town planning in a residential area—Direction, width and construction of main arterial, secondary and subsidiary streets—Building line in such streets—Sites for public buildings, &c.—Open spaces for recreation grounds and parks—Sewerage and sewage disposal—Water supply and lighting—Widening of existing roads—Bridlington's town planning scheme. Town planning in an industrial area: Comparison between the planning of a residential and an industrial area, and a consideration of the various points which arise in planning an industrial area.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. ACKERMANN,
Secretary.

17 Victoria-street, S.W.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **THE SURVEYOR** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—September 28th.—Corporation of Bradford. £85 per annum.—Mr. F. Stevens, town clerk.

CITY ARCHITECT AND SURVEYOR.—September 28th—November 1st.—Corporation of Calcutta. £90 per month.—The Hon. S. L. Maddox, C.S.I., I.C.S., chairman of the Corporation of Calcutta, East India United Service Club, 16 St. James's-square, London, S.W., or (up to November 1st) Mr. C. C. Chatterjee, secretary, Corporation of Calcutta.

DRAUGHTSMAN. — October 2nd. — Shoreditch Borough Council. £100—£140.—Mr. J. A. D. Milne, town clerk.

CLERK OF WORKS.—October 2nd.—Hayes Urban District Council. £3 per week.—Mr. C. D. Lewis, clerk.

CLERK OF WORKS.—October 3rd.—Corporation of Huddersfield.—Town Clerk.

SANITARY INSPECTOR.—October 7th.—Corporation of Bournemouth. £100—£130.—Mr. H. Ashling, town clerk. Application to be endorsed "Sanitary Inspector."

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

HIGHWAYS SUPERINTENDENT.—October 12th.—Corporation of Huddersfield. £120 per annum.—Mr. K. F. Campbell, borough engineer and surveyor.

HIGHWAY SURVEYOR.—October 14th.—Truro Rural District Council. Mr. Coulter Hancock, solicitor.

DEPUTY CITY SURVEYOR.—October 19th.—Corporation of Manchester. £500 per annum.—Mr. Thos. Hudson, town clerk. Applications to be endorsed "Deputy City Surveyor."

COUNTY SURVEYOR.—October 19th.—County of the Soke of Peterborough. £200 per annum.—Mr. Walter J. Deacon, clerk, Cross-street, Peterborough. Applications to be endorsed "Application for County Surveyorship."

CHIEF ENGINEER.—October 28th.—Municipality of Karachi (India). 500—750 rupees per month.—Mr. Measham Lea, chief officer and chief engineer, Municipal Office, Karachi.

CLERK OF WORKS.—September 29th.—Rivers Committee of the Corporation of Manchester. £3 3s. per week.—Mr. Thomas Hudson, town clerk.

ASSISTANT ENGINEER.—Government of Sierra Leone. £300 a year.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W. Quote M 5,538 on left-hand top corner of application.

ASSISTANT ENGINEER.—Government waterworks on the Gold Coast. £600—£650. Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W. Quote M 5,605 on left-hand top corner of envelope.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* **THE SURVEYOR** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

RANGOON.—September 28th—February 1st.—The date in the conditions in Clause 28 has been altered from August 31st to September 28th and in Clause 14 from January 1st to February 1st, 1913. The latest date for posting letters to reach Rangoon by February 1st will be by the Indian mail of January 10th.

SLIGO. September 30th. For a scheme of electric lighting, for the corporation.—Mr. J. McGoveran, town clerk. Tenders to be endorsed "Electric."

LLANELLY.—September 30th.—Competitive designs and estimates for school buildings for over 1,000 children, also domestic subjects centre, for the Education Committee.—Mr. G. E. Halliday, F.S.A., F.R.I.B.A., Castle-street, Cardiff, will act as assessor and award premium. Mr. I. W. Watkins, clerk, Education Offices, Coleshill-terrace, Llanelly.

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

LLANDUDNO.—October 31st.—Designs for laying out about 20 acres, for the urban district council. A premium of 50 guineas is offered.—Mr. A. Conolly, clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas. —Mr. J. Henry Field, town clerk.

ROSCREA.—November 1st.—Plans, specifications, and estimates of a sewerage system, for the Roscrea No. 1 Rural District Council. £21 to be awarded to the best plan. Mr. T. Hooley, clerk, The Workhouse.

ORSETT (Essex). January 1st. For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered. Mr. James Beck, clerk, 2 Orsett-road, Grays.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on Wednesdays to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.

Buildings.

NELSON. September 28th.—For the construction of a bridge, for the corporation. Mr. W. Shackleton, borough engineer.

HARROGATE.—September 30th.—For the erection of boundary walls to cemetery, for the corporation. —Mr. C. E. Rivers, borough engineer and surveyor.

STOCKPORT.—September 30th.—For taking down one of the bays of the covered market and other work, for the corporation.—Mr. J. Atkinson, borough surveyor.

TIPTON.—September 30th.—For the erection of sanitary conveniences, drains, and paving of playgrounds, for the Education Committee.—Mr. E. Richards, secretary.

GREAT YARMOUTH.—September 30th.—For extensions to the fire brigade and police stations.—Town Clerk.

ENFIELD.—October 1st.—For the erection of a school and cottage, for the Education Committee.—Mr. N. Hepworth, clerk.

LONDON. October 1st. For the erection of training college and hostel, and adapting existing house for a hostel, for the county council.—Sir Laurence Gomme, clerk.

NORTH RIDING.—October 2nd.—For the erection of a cookery and manual instruction room, for the Education Committee.—Mr. J. C. Wrigley, secretary, County Education Offices, Northallerton.

GREENOCK. October 2nd. For the erection of a school, for the School Board.—Mr. A. F. Niven, clerk, Municipal Buildings, Greenock.

SOUTHEND-ON-SEA. October 2nd. For the erection of pumping station and destructor buildings, inclined roadway, two cottages, and other works at the sewage disposal works, for the corporation.—Mr. H. J. Worwood, town clerk.

BUCKINGHAM.—October 3rd.—For the erection of six cottages, for the rural district council.—Mr. T. R. Hearn, clerk.

HERTFORD.—October 3rd.—For the construction of a bridge, for the Highways Committee.—Mr. Urban A. Smith, county surveyor, Hatfield.

WEST RIDING. October 4th. For alterations at a public school, for the Education Committee. Mr. Francis Alvey Darwin, clerk, County Hall, Wakefield.

LEICESTERSHIRE. October 4th. For the erection of handicraft centres, for the county council. The Architect, 33 Bowling Green-street, Leicester.

BIRKENHEAD.—October 7th.—For the construction of a gallery in the swimming bath, for the corporation.—Mr. J. Fearnley, town clerk.

ALTRINCHAM.—October 7th.—For the erection of a public convenience, for the Sanitary Committee.—Mr. H. E. Brown, surveyor.

CORNWALL.—October 12th.—For alterations to a school, for the Education Committee.—Mr. F. R. Pascoe, secretary, County Hall, Truro.

HERNE BAY.—October 16th.—For the erection of a pavilion and concert hall, for the urban district council.—Mr. G. H. Beetenson, clerk.

WEST RIDING.—October 18th.—For alterations to a school, for the county council.—The Clerk, County Hall, Wakefield.

HENDON.—October 21st.—For the erection of fifty artisans' dwellings, for the urban district council.—Mr. H. Humphris, clerk.

HENDON. October 21st. For the erection of a fire station, for the urban district council.—Mr. H. Humphris, clerk.

Iron and Steel.

BRIDLINGTON. September 30th. For carrying out a water main extension, for the rural district council.—Mr. Geo. Hankinson, clerk.

HARROGATE.—September 30th.—For the extension of the royal pump-room, for the town council.—Mr. C. E. Rivers, borough engineer.

LEEDS.— September 30th—October 7th.—For the erection of steel and corrugated-iron building, and constructing surface-water drainage, for the Tramways Committee.—Chairman of the Tramways Committee.

GLASGOW.—September 30th.—For the supply of penstock valves, cast-iron pipes, cast-iron columns and joists, for the corporation. Mr. J. Lindsay, town clerk.

DUNDEE. October 1st. for the supply of cast-iron pipes, for the Water Commissioners. Mr. W. H. Blyth Martin, clerk, City Chambers, Dundee.

ROTHERHAM.—October 12th.—For excavating, laying, jointing, and filling in 21 miles of cast-iron spigot and socket pipes, the sizes ranging from 8 in. to 3 in., for the rural district council.—Messrs. Oxley and Coward, clerks.

ROTHERHAM.—October 12th.—For the supply of 1,330 tons of cast-iron spigot and socket pipes with special castings, for the rural district council.—Messrs. Oxley and Coward, clerks.

Roads.

COCKENZIE.—September 28th.—For the construction of macadam roads, for the town council.—Mr. R. Tulloch, burgh surveyor.

KNUTSFORD.—September 30th.—For making good certain roads, for the urban district council.—Mr. E. L. Ashworth, clerk.

FAVERSHAM.—September 30th.—For the supply of granite or basalt, and chippings, for the corporation. —Mr. G. Tassell, town clerk.

SHREWSBURY.—September 30th.—For making up Water-street, for the corporation.—Mr. W. Chapple Eddowes, borough surveyor.

WARRINGTON.—September 30th.—For laying concrete flags, for the corporation.—Borough Surveyor.

COWES.—September 30th.—For the supply of gravel and road material, for the urban district council.—Mr. J. C. W. Damant, clerk.

CAERPHILLY.—October 1st.—For private street works in three thoroughfares, for the urban district council.—Mr. A. D. Harpur, surveyor.

MALDENS AND COOMBE.—October 1st.—For works of kerbing, channelling and widening, for the urban district council.—Mr. R. H. Jeffes, engineer and surveyor.

EALING.—October 1st.—For making up a road, for the corporation.—Mr. G. E. Brydges, town clerk.

LLANDAFF AND DINAS POWIS.—October 1st.—For works of street improvement, for the rural district council.—Mr. M. Warren, clerk, Park House, Cardiff.

SWANSEA.—October 1st.—For the execution of private street works, for the corporation.—Mr. H. L. Coath, town clerk.

CHICHESTER.—October 1st.—For the supply of 1,000 tons of 2-in. broken granite, basalt, or other approved material, for the corporation.—Mr. J. W Loader, town clerk.

LITTLEHAMPTON.—October 2nd.—For taking up old paving, and laying indurated flagging, kerbing and channelling and steam rolling, for the urban district council.—Mr. Arthur Shelley, clerk.

LIMERICK.—October 2nd.—For laying 12,000 sq. yds. of footways with mineral rock mastic asphalt, for the corporation.—Mr. W. M. Nolan, town clerk.

TANGIER.—October 3rd.—For the construction of a road 1½ miles long, for the Committee of Public Works.—Specifications may be obtained at the Intelligence Branch of the Board of Trade, 75 Basinghall-street, E.C.

SWANSEA.—October 3rd.—For works of road widening, for the rural district council.—Mr. E. Harris, clerk.

LAMBETH.—October 3rd.—For laying creosoted deal paving blocks, for the borough council.—Mr. T. F. Garnish, deputy town clerk.

ARGYLL.—October 3rd.—For works of widening, bottoming and metalling, for the Lorne District Committee.—Mr. W. Ironside, district clerk, Oban.

RHONDDA.—October 4th.—For laying 770 yds. of 10 in. water main, for the urban district council.—Mr. O. Thomas, engineer.

TEDDINGTON.—October 5th.—For making up three roads, for the urban district council.—Mr. G. H. Salmons, clerk.

HUYTON.—October 5th.—For the supply of macadam and granite chippings, for the urban district council.—Mr. G. W. Swift, clerk.

WHITLEY AND MONKSEATON.—October 7th.—For the reconstruction of footways, for the urban district council.—Mr. Augustus Whitehorn, clerk.

STANLEY.—October 7th.—For making up roads and surface-water drainage, for the urban district council.—Mr. John G. Ridley, clerk.

HORNSEY.—October 7th.—For making up with tarred bituminous or asphalt certain roads, for the corporation.—Mr. E. J. Lovegrove, borough engineer.

HARROW-ON-THE-HILL.—October 12th.—For making up private streets, for the urban district council.—Mr. J. Strachan, clerk.

SHEERNESS.—October 15th.—For the supply of basalt or granite, Kentish ragstone, hoggin and Thames ballast, for the urban district council.—Mr. V. H. Stallon, clerk.

Sanitary.

NELSON.—September 28th.—For the construction of sewers and sewage works extensions, for the corporation.—Mr. W. Shackleton, borough engineer.

SOUTHWICK.—September 28th.—For the construction of surface-water drains and outfall sewer, for the urban district council.—Mr. G. W. Warr, surveyor.

CAIRO.—September 30th.—For sanitary installations, for the Office of Public Works.—Administrative Service, Public Works Ministry, Cairo.

WATFORD.—September 30th.—For the supply of concrete tubes of 36 in., 30 in., and 21 in., for the urban district council.—Mr. W. Hudson, clerk.

BLEAN.—September 30th.—For the construction of sewage disposal works, for the rural district council.—Mr. F. A. Ward, Roseneath, Eddington, Herne Bay.

WATFORD.—September 30th.—For the construction of storm-water drainage and sewerage works, for the urban district council.—Mr. D. Waterhouse, engineer and surveyor.

TIPTON.—September 30th.—For the erection of public conveniences, for the Education Committee.—Mr. W. H. Jukes, surveyor.

BALLINROBE.—September 30th.—For laying pipe sewers, for the rural district council. Mr. J. Walsh clerk.

THRAPSTON.—September 30th.—For the construction of a sewer, for the rural district council. Mr. T. Lloyd, surveyor.

STALYBRIDGE AND DUKINFIELD.—September 30th.—The Joint Sewerage Board notify that the time for the receipt of tenders for the extension of the Bradley Hurst works has been extended to September 30th.

DRIFFIELD.—October 1st.—For laying sanitary pipe drains, for the rural district council. Mr. T. Cawser Pennyman, surveyor.

EAST GRINSTEAD.—October 2nd.—For the construction of sewage disposal works, comprising detritus tanks settling tanks, storm water, standing tanks, filter-beds, humus tanks, laying sewers and the construction of manholes, for the rural district council.—Mr. Francis S. White, clerk.

BRAILA (Roumania).—October 3rd—7th.—For work of drainage and laying conduits, at the estimated cost of £16,000, for the corporation.—Primaria Orasulni Braila, Roumania.

RUGBY.—October 4th.—For the removal of refuse, and cleansing closets, for the rural district council.—Mr. J. W. Pendred, clerk.

BLAYDON.—October 8th.—For removal of contents of ashpits, for the urban district council.—Mr. H. Dalton, clerk.

BRADFORD.—October 9th.—For the construction of circular outfall sewer in tunnel, and two shafts, for the corporation.—Mr. Frederick Stevens, town clerk.

POOLE.—October 9th.—For emptying cesspools, for the rural district council.—Mr. P. E. L. Budge, clerk.

KIRKBY-IN-ASHFIELD.—October 15th.—For laying 4,378 yds. of iron and stoneware outfall sewers, with manholes and other works, for the urban district council.—Mr. E. Bertram Hibbert, clerk.

BLYTH.—October 15th.—For scavenging work, for the rural district council.—Mr. F. Hopkinson, surveyor, 66 Bridge-street, Worksop.

Stores.

GELLYGAER.—September 30th.—For the supply of oilskin suits, pavings, kerbs, channels, cast-iron goods, smithwork, Portland cement, hydraulic lime, ironmongery, drain pipes, and street brushes, for the urban district council.—Mr. J. P. Jones, surveyor, Council Offices, Hengoed, *vid* Cardiff.

ABERDEEN.—October 1st.—For the supply of steel and iron, ironmongery, timber, chandlery, plumber work, brass and copper, and bricks and drain pipes, for the Harbour Commissioners.—Mr. R. G. Nicol, harbour engineer.

Miscellaneous.

KINGSTON-UPON-THAMES.—September 28th.—For the supply of sulphuric acid, for the corporation.—Mr. Harold A. Winser, town clerk.

Rural Housing Reform.—The Local Government Board have made a concession to Norfolk district councils according to which part of the annual cost of cottages to be erected by the Swaffham Rural District Council and owned by them may be paid for by loan from the Local Government Board. In this way agricultural labourers will obtain more reasonable rents.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

BIRMINGHAM.—For the erection of a special school, for the corporation.—Mr. J. A. Palmer, secretary of the education committee, Council House:—

F. H. Smith, Birmingham.
B. Whitehouse & Son, Birmingham.
E. Crowder, Birmingham.
T. Elvins & Sons, Birmingham.
W. Harvey Gibbs, Birmingham.
J. Dallow & Sons, Birmingham.
H. H. Crump, Birmingham.*

BUSHEY.—For making up two roads, for the urban district council.—Mr. E. E. Ryder, surveyor:—

Judge & Son, Watford	£3,003
F. P. Bass, Bushey	2,659
Free & Sons, Maidenhead	2,631
Bracey & Clarke, Watford	2,408
The Surveyors (Mr. E. E. Ryder), Council Offices, Bushey	2,363
Bailey & Sons, Bushey Heath*	2,269

CHESTER-LE-STREET.—For the construction of a new road, for the rural and urban councils.—Mr. W. Ayton, highway surveyor:—

J. & R. Wood, Brandon Colliery	£6,471
W. Kennedy, Jarrow-on-Tyne	5,800
J. W. Henderson, South Gosforth	5,647
W. Morley & Son, Keighley	5,512
G. Armstrong, Whitley Bay	5,098
R. Hudson & Son, Sunderland	5,016
G. E. Simpson, Newcastle-on-Tyne	4,900
G. Dyson, Felton Lane Ends	4,850
A. Stark & Son, Glasgow	4,752
J. Cawkell, Durham	4,700
Jas. McLaren, junr., Gosforth	4,682
Thompson & Son, Chester-le-Street*	4,597

CHESTER LE-STREET.—For the construction of a bridge, for the rural council:—

R. Hudson & Son, Sunderland	£10,250
Head, Wrightson & Co., Thornaby	10 050
A. Findlay & Co., Limited, Motherwell	10,497
Cleveland Bridge Co., Limited, Darlington	10,300
Brims & Co., Newcastle-on-Tyne*	9,916

COLWYN BAY.—For laying a 15-in. sewer in Cliff-road, Old Colwyn, for the urban district council.—Mr. W. Jones, Colwyn Bay, engineer:—

R. S. Leech, Bawtry, Yorks	£812
Mitchell & Son, Manchester	689
R. L. Roberts, Llandudno	667
M. H. Boswell, Wolverhampton	540
Graham & Son, Halifax	519
Anderton & Co., Colwyn Bay	447
R. Rowlands, Colwyn Bay	441
P. S. Trentham, Birmingham†	428

Engineer's estimate, £445.

ITCHEN.—For work in ten roads, for the urban district council.—Mr. T. A. Collingwood, surveyor:—

A. Streeter & Co., Guildford	£1,685
F. Osman & Co., Southampton	1,641
Grounds & Newton, Bournemouth*	1,587

Surveyor's estimate, £1,672.

KEIGHLEY.—For the supply of 615 tons of cast-iron pipes and special castings, for the town council.—Mr. M. R. Barnett, engineer:—

Clapham Brothers, Limited, Keighley	£4,575
R. Maclaren & Co., Limited, Glasgow	4,455
D. Y. Stewart & Co., Limited, Glasgow	4,415
Macfarlane, Strang & Co., Limited, Glasgow	4,356
The Staveley Coal and Iron Company, Limited, Chesterfield	4,382
The Sheepbridge Coal & Iron Company, Limited, Chesterfield	4,368
The Clay Cross Company, Clay Cross Chesterfield	4,368
Cochrane & Co (Woodside), Limited, Dudley	4,355
The Stanton Iron Works, Limited, Nottingham	4,361
J. Oakes & Co., London	4,341
The Holwell Iron Company, Limited, Ashfordby	4,333
Cochrane & Co. (Cochrane Grove Branch), Limited, Middlesbrough-on-Tees*	4,253

MALDON.—For laying 2,000 yards of cast-iron water mains, for the rural district council:—

Godfree & Co., London	£1,247
G. P. Trentham, Birmingham	676
Hanney Brothers, Swansea	654
May & Butcher, Heybridge	640
G. Porter, Hackney	631
Staveley Coal & Iron Company, Chesterfield	598
A. Farley, Glamorgan	591
A. T. Arnold, Hatfield Peverel	520

TREDEGAR.—Accepted for the construction of subsidiary sewers, comprising about 2¾ miles of 6-in., 9-in., 12-in. and 18-in. pipe sewers, with 800 manholes, for the urban district council.—Mr. W. L. Roach, surveyor:—

W. Waring & Sons, Huddersfield, £21,279.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

SEPTEMBER.

28.—Institution of Municipal and County Engineers: East Midland District Meeting at Ilkeston.

OCTOBER.

2.—Institute of Sanitary Engineers: Opening Sessional Meeting, Caxton Hall, Westminster. 8 p.m.

4-5.—Royal Sanitary Institute: Meeting at Lewes. Mr. D. Roberts, borough surveyor, on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams."

7.—Society of Engineers: Mr. E. R. Matthews on "Town Planning from an Engineering Aspect," Institution of Electrical Engineers, Victoria embankment, W.C. 7.30 p.m.

11-12.—Institution of Municipal Engineers: Annual General Meeting in London.

15.—Institution of Municipal Engineers: Eastern District Meeting at Godmanchester.

19.—Institution of Municipal Engineers: Joint Meeting of Northern and Yorkshire Districts at Harrogate.

26.—Royal Sanitary Institute: Meeting at Alton; Discussions on "Housing Problems in County Areas" and "Municipal Work in Alton." Town Hall, 11.15 a.m.

APPOINTMENTS OPEN.

CITY OF MANCHESTER.

The Corporation of Manchester invite applications for the position of Deputy City Surveyor. Salary £500 per annum. Candidates must have had practical experience in all the duties of a Borough Surveyor, and must be full Members of the Institution of Civil Engineers.

The gentleman appointed will be required to devote the whole of his time to the duties of the office, to become a contributor to the Manchester Corporation Officers' Thrift Fund, and to execute their Deed of Service.

Applications, stating particulars as to age, health, and professional attainments, qualifications, &c., and accompanied by copies of four testimonials, and in addition the names of three referees, must be delivered to me endorsed "Deputy City Surveyor," on or before October 19th, 1912.

Printed copies of the application and testimonials are not required, and canvassing is prohibited.

PHILIP S. HUDSON,
Town Clerk.

Town Hall, Manchester.
September 12, 1912.

ADMINISTRATIVE COUNTY OF THE SOKE OF PETERBOROUGH.

COUNTY SURVEYOR.

The County Council are desirous of obtaining at the end of the current year the undivided services of a thoroughly competent Surveyor and Draughtsman to undertake the duties—(*a*) of maintaining, &c., the Rural Main Roads and Bridges of the County; (*b*) pertaining to the adaptation of land and the erection and supervision of buildings for Small Holdings; (*c*) relating to the inspection of and additions or alterations to School Houses and Buildings, and generally to render such services as may reasonably be required of him by this Council.

Salary £200 per annum, to include clerical and other expenses, except travelling, for which an allowance of £50 per annum will be made. The person appointed will be required to reside within the County and commence his duties on the 1st of January next.

Applications, accompanied by testimonials (not exceeding three in number), to be sent to me on or before the 19th day of October next, marked "Applications for County Surveyorship."

N.B.—Personal canvass will disqualify.

WALTER J. DEACON,
Clerk of the County Council.

Cross-street, Peterborough.
September 19, 1912.

THE RURAL DISTRICT COUNCIL OF TRURO.

The above-named Council invite applications for the appointment of Highway Surveyor for the North Division, which comprises 8 parishes with about 230 miles of highways. Candidates must have had practical experience in road work, be competent to perform all the duties appertaining to the office, and to keep the necessary books and accounts.

The person appointed will be required to reside in a central position in the district, provide his own means of locomotion, and devote the whole of his time to the duties. The Council will provide necessary books, stationery and postages.

The person appointed will be required to give a bond for £150 in some approved Guarantee Society. Three months' notice on either side to terminate the engagement.

Applications, in candidate's own handwriting, on foolscap paper, stating salary required, age, qualifications and experience, accompanied by copies of not more than three recent testimonials, to reach me, the undersigned, Clerk to the Council, not later than Monday, the 14th October, 1912. The envelope should be marked on the outside "Surveyor."

(By order)
COULTER HANCOCK,
Solicitor.

Truro.
Dated September 18, 1912.

COUNTY BOROUGH OF HUDDERSFIELD.

The Corporation require the services of an experienced Highways Superintendent, to take charge of a District under the Borough Engineer.

Applicants must have had practical experience in sewering, paving and macadamising of roads, and be competent to set out and measure up work, and keep daily accounts of all labour and materials used.

The person appointed must have had previous practical experience in a similar situation, and be prepared to reside within his district.

For statement of duties apply to the Borough Engineer.

Salary £120 per annum.

Applications, in the handwriting of candidates, giving full particulars of present and previous occupation, age, &c., accompanied by copies of not more than three testimonials of recent date, endorsed "Highway Superintendent," must be addressed to me not later than 10 a.m. on Wednesday the 9th October, 1912.

Canvassing will be useless.

K. E. CAMPBELL, M.I.C.E.,
Borough Engineer and Surveyor.

1 Peel-street, Huddersfield.
September 24, 1912.

MUNICIPALITY OF KARACHI (INDIA).

Applications are invited for the appointment of an Engineer as Assistant to the Chief Engineer.

2. Applicants must have a thorough experience in water and drainage works, the construction, maintenance of roads with various materials, the design of buildings and their construction and maintenance, and the preparation of drawings, estimates and reports. They must also be capable of supervising efficiently the Public Works Department of the Municipality.

3. Applicants must hold a diploma of some recognised Civil Engineering College, or have passed the examination qualifying for Associate Membership of the Institution of Civil Engineers, and preference will be given to applicants who also hold the diploma of the Institution of Municipal and County Engineers.

4. The selected candidate will be required to furnish a medical certificate of sound health and constitution prior to his engagement, and when appointed will be required to sign an agreement for three years, and to subscribe to the Municipal Provident Fund, according to the By-laws in force from time to time.

5. The salary of the post is Rs. 500 per month, rising by annual increments of Rs. 50 to Rs. 750 per month, with a conveyance allowance of Rs. 40 per month.

(NOTE.—15 rupees = £1 sterling.)

6. The salary will commence from the date of joining the appointment in Karachi, but a single first-class steamer or rail fare to Karachi will be paid by the Municipality.

7. The leave regulations are those provided for in the Rules and By-laws, and are similar to the uncovenanted leave rules of the Government of India.

8. Applications, stating age, qualifications and experience, together with copies of testimonials, should be addressed to the Honourable Mr. Harchandrai Vishindas, B.A., LL.B., President, Karachi Municipality, and should reach the Municipal Office not later than 28th October, 1912.

MEASHAM LEA, A.M.INST.C.E.,
Chief Officer & Chief Engineer,
Karachi Municipality.

Municipal Office, Karachi.
August 15, 1912.

TENDERS WANTED.

URBAN DISTRICT COUNCIL OF KIRKBY-IN-ASHFIELD, NOTTS.

The above-named Council invite Tenders from responsible Contractors for Sewerage and Extensions to the Sewage Disposal Works.

The works comprise about 4,378 yds. of 15-in., 12-in., and 9-in. diameter Iron and Stoneware Outfall Sewers, &c., together with Manholes and other appurtenant Works, and taking up and relaying certain Sewers, also alterations and extensions at the Outfall Works, including Bacterial Filters, Circular Tanks, and sundry alterations to existing Works, also erection of small Engine-house and 554 yds. of 4-in. Pumping Main, &c.

Plans and Specifications can be seen at the Offices of the Engineers, Messrs. Elliott & Brown, A.MM.INST.C.E., Burton Buildings, Parliament-street, Nottingham, and copies of the Bills of Quantities and Form of Tender may be obtained after September 24th on deposit of Three Guineas (by cheque), which will be returned on receipt of a *bonâ-fide* Tender, not afterwards withdrawn, and the return of all documents sent to the Contractor for the purpose of making up his Tender within fourteen days of the notice informing him a Tender has been accepted.

Sealed Tenders, endorsed "Tender for Kirkby Sewerage Works," to be delivered to the undersigned not later than the first post on Tuesday, the 15th day of October, 1912.

The lowest or any Tender will not necessarily be accepted.

The Engineer will notify applicants of a date when the Plans may be inspected at Kirkby, and the [illegible] Work proceeded with.

By order,
T. BERTRAM HIBBERT,
Solicitor and Clerk to the Council.

Public Offices,
Kirkby-in-Ashfield.
September, 1912.

TO ROAD CONTRACTORS AND TAR-PAVIORS.

HIGH-STREET, TWICKENHAM-ROAD AND MANOR-ROAD IMPROVEMENTS.

The Urban District Council of Teddington are desirous of receiving Tenders for the following Works in connection with the Making Up and Improvement of the above—*viz.*:—

134 super. yds. Roadway Formation.
364 lin. yds. 12-in. by 8-in. Norwegian Granite Kerb.
58 lin. yds. Granite Channel and Laying.
580 super. yds. 2½-in. Artificial Stone Paving.
134 super. yds. Tar Paving and Laying.

Plans and Specifications may be seen, Bills of Quantities and Forms of Tender obtained (on payment of £2 2s., which will be returned on receipt of a *bonâ-fide* Tender), on application to Mr. M. Hainsworth, Surveyor, Council Offices, Teddington.

Sealed Tenders, endorsed "Road Works," must be delivered to me, the undersigned, at the Council Offices, Teddington, not later than noon on Saturday, the 5th day of October, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)
G. H. SALMONS,
Clerk.

Council Offices,
Teddington.
September 16, 1912.

BOROUGH OF EALING.

The Town Council of this Borough hereby invites Tenders for the Making Up of Temple-road.

The Drawings and Specification may be seen, and Forms of Tender, together with Bill of Quantities and other particulars, may be obtained from Mr. Charles Jones, M.INST.C.E., Borough Engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d., which will be returned upon receipt of a *bonâ-fide* Tender.

Sealed Tenders (in the envelopes provided), endorsed "Tender for Making Up," must be delivered at my Office not later than 9.30 a.m. on Tuesday, the 1st day of October, 1912.

The Council does not bind itself to accept the lowest or any Tender.

The tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligation arising from his Tender even though he may not have signed a formal contract.

Dated this 16th day of September, 1912.

(By order of the Council)
GEO. E. BRYDGES,
Town Clerk.

Town Clerk's Office,
Town Hall, Ealing, W.

COUNTY OF SOUTHAMPTON.

RECONSTRUCTION OF FORE BRIDGE, PETERSFIELD.

TO CONTRACTORS.

Persons desirous of tendering for the Reconstruction of a Small Bridge, known as Fore Bridge, can obtain copies of the Plan and Specification, General Conditions, and all other necessary information on application at the office of Mr. W. J. Taylor, County Surveyor, the Castle, Winchester, on and after Monday, the 30th September, 1912, between the hours of 8 a.m. and 4 p.m. (Saturdays 8 a.m. and 12 noon).

A deposit of Two Guineas will be required for a copy of the plan and specification, which will be refunded on receipt of a *bonâ-fide* Tender and the return of the document.

Deposits must be made by cheque, payable to the "Hants County Council," and crossed "Bank of England," or the particulars will not be sent.

Tenders must be on forms supplied by the County Surveyor, endorsed "Fore Bridge," and be delivered to me on or before 10 a.m. on Monday, the 7th October, 1912.

The County Council do not bind themselves to accept the lowest or any Tender.

H. BARBER,
Clerk to the County Council.

The Castle, Winchester.
September 24, 1912.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. OCTOBER 4, 1912. No. 1,081.

Minutes of Proceedings.

Sewage Disposal in the United States.

Recent issues of our American contemporaries contain news of the progress of sewage disposal in that country. In Pennsylvania actions are being taken against a number of municipalities for discharging sewage into streams without preliminary purification. Fines of £100, and £10 for each day the injunction is disregarded, are provided by law, and it is stated that the State officials contend that vigorous steps must be taken to demonstrate that the Commonwealth intends to enforce the purity of streams in view of the increasing population and the demands for pure water supplies. The same number of *Municipal Engineering*, from which the foregoing information was obtained, contains an interesting editorial article upon the State Control of Sewage Purification. It appears that the question of the extent to which the State can control the sewage pollution of streams and enforce the purification of their sewage by municipalities has been an open question until recently. The States of Ohio and Indiana passed laws in 1908 and 1909 respectively placing these matters under the control of State Boards of Health, but little has been done so far, because one city in Ohio attacked the constitutionality of the law. This has, however, now been affirmed by the Supreme Court on appeal from two lower courts. Exceptions were allowed in the cases of some towns discharging into a river which formed the boundary between two States, and into which towns in another State, on the opposite bank of the river, were discharging unpurified sewage. As we read it, the exemption continues only so long as the towns in the other State continue to pollute the river water. The Ohio State Board of Health can now proceed with much work which has been delayed waiting for this decision, and it is anticipated that other States will soon follow suit, and adopt these laws as their advantages are demonstrated. Our contemporary utilises the opportunity to point out that it is necessary for efficiency that the State Board of Health and its activities should be kept out of politics, and we venture to express the hope, in the interests of public health, that this sound advice will be followed.

In another State we find that the United States Attorney-General, in an agreement with the Bronx Valley Sewer Commission, has gone so far as to define the quality of a sewage effluent which may legally be discharged into a lake or river. In this case it is to be 10 per cent better than that of the raw sewage "upon an absolute putrescibility scale." Our contemporary, in this case the *Engineering Record*, considers that "this is explicit enough, considered merely in a literal sense, but it is open to question just how closely the results of rival analysts, employed by the two parties to the agreement, will agree if the operation of the plant should ever be a matter of dispute. The inherent difficulty is the lack of any accepted standard test, by which is meant not only the general nature of the test, but also the details of making it." We agree, and if many such agreements are arranged we foresee a good time coming for consulting analysts, engineers, and lawyers.

Disposal by dilution is proposed for the treatment of the sewage from the town of Albany, N.Y., with a population of over 100,000, but in this case screening and settlement in Imhoff tanks is recommended for the purpose of removing the suspended solids from the sewage before it is discharged into the river. If the results from this preliminary treatment are as good as it has been claimed can be obtained by this system there should be no need for additional purification; but there is apparently some doubt on this score, as it is stated that the disposal works have been so designed that sprinkling filters can be added at some future date should it be found necessary to provide for a higher degree of purification. This proposed method of treatment as a preliminary to discharge into a large river for disposal by dilution is in accordance with the latest knowledge of the subject, and should prove to be the most practical and economical method suitable for the local conditions. The treatment of the sewage at Providence, Rhode Island, by chemical precipitation, which was continued during the year 1911, would, however, appear to be somewhat costly, particularly as the precipitation tank effluent was further disinfected by the addition of hypochlorite of lime, as much as 5·24 parts per million of available chlorine being used. As 83·43 per cent of the suspended organic matter in terms of albuminoid ammonia was removed from the sewage the desired result was probably attained, but it is open to question whether equally good results could not have been secured at a much lower cost for operation, seeing that the aim is the same as in the case of Albany. Particulars of the efficiency of the processes now so largely adopted in America for the disinfecting of

sewage effluents by hypochlorite in actual practice over a number a years are gradually coming to hand. In one case recently published, after the experience of six years' operation, it is found that the addition of two parts per million of available chlorine to percolating filter effluent does actually produce a practically sterile effluent. At any rate, it removes all B. Coli, a result which is considered quite satisfactory. Full details are also given in another article of the operation of an installation of septic tanks and contact beds, which was constructed in 1900, and which has been carefully tested in actual practice. Most of the suggestions made as the result of this experience for modifications in detail of the original design coincide with the experience gained in this country, particularly the recommendation that false bottoms and a greater slope on the floor would increase the life of the material, and that filling the beds from the bottom reduces the possibility of nuisance. Another interesting statement is that "minimum initial expenditure can be made to yield great efficiency." It is obvious that careful management is assumed in this connection, and, with this addition, it confirms what has been said on several occasions by engineers in this country.

* * *

Reinforced Concrete and Bridge Reconstruction.

Now that the disastrous floods to which a large portion of the county of Norfolk has been subjected have abated, the work of remedying the damage is calling for attention. The county road bridges have suffered most severely from the inundation, and a considerable number of them will require to be rebuilt. Doubtless in this work due regard will be had to the claims of reinforced concrete, a material which seems to be peculiarly adapted for structures that may be subjected to severe water pressure. Such strenuous endeavours have been made by the supporters of reinforced concrete to emphasise the cheapness of this form of construction, that comparatively little regard has been paid to two equally important characteristics—the very low maintenance charges, as compared with steel structures, and the possession of great transverse strength in every direction, strength which is practically non-existent in the case of masonry structures. This last-mentioned characteristic is one of very great importance in the case of small bridges, the supports of which, on occasions of flood, are subject to the action of a heavy stream of water. A masonry bridge when thus affected can oppose to the action of the water merely the weight of the mass of its materials, and the transverse or shearing strength of its cement or mortar joints. Neither of these is of very great value. The first is practically negligible in the case of the topmost courses of masonry, which have only their own weight to hold them in position; as regards the second, the strength of cement or mortar joints in an old structure is very slight. A reinforced concrete bridge pier or abutment can, however, be designed to act as an exceedingly strong vertical cantilever, and if its foundation is carried to such a depth as to provide a firm fixing, free from erosion by the water, the whole structure will offer a most stubborn resistance to any water pressure that may be brought to bear against it. This is only one of the many instances in which the great transverse strength of reinforced concrete is of value, and an engineer in comparing the value of a reinforced concrete structure with one of masonry should never omit to take into account the importance of this characteristic of the former work.

* * *

Stafford Corporation and the Housing Act.

The increased activity of the Local Government Board in the matter of sanitation and housing is a welcome fact as well as a sign of the times. How necessary this accelerated procedure is was strikingly illustrated recently at Stafford in the course of an inquiry before Mr. Edward Leonard into the reason why the corporation had failed to exercise their powers under Part II. and Part III. of the Housing of the Working Classes Act, 1890. A witness who was described as chairman of the Public Health Committee, while frankly acknowledging a lack of information with respect to sec. 17 of the Act of 1909 (which, of course, deals with inspection of working-class property), had also to admit that he had not attended a meeting of the town council or the committees for six months. In the circumstances it was, of course, unfortunate that this gentleman was called at all, for absenteeism in such a connection, while it may be quite excusable, must sadly discount the value of such a witness's evidence. As a matter of fact, the inspector appears to have been quite unable to extract any useful testimony from the witness; and presently he had also to confess that he was unable to understand why, after the Public Health Committee had determined "to take no action for the present in view of the lack of suitable accommodation" for people in the houses condemned by the medical officer of health, they suddenly took it into their heads to instruct an official to inspect other property. Naturally the condemned properties were becoming worse meanwhile, yet they were apparently to be regarded as non-existent. When self-deception takes such a form as this it is not surprising to find that the chairman of the Working Classes Housing Committee told the inspector that, "in his opinion," the majority of the forty-nine houses condemned by the medical officer could be made habitable. "Have you seen them?" inquired the inspector. "No," was the reply of the witness. Ineptitude could hardly go further than this. The outstanding fact of a not altogether creditable municipal performance was eventually elicited from Dr. Blumer, medical officer of health, and this was to the effect that in Stafford there are 500 houses which would come under sec. 17 of the Act, and that the corporation are not carrying out their duty under the Housing Act. It is manifest that such a deplorable state of things must be dealt with speedily and drastically if the law is not to be regarded as a dead letter.

* * *

Removal of Gas and Water Mains.

In the execution of street works which involve an alteration of level, as, for example, the conversion of a macadam road into a wood-paved one, with the consequent reduction of camber, a question frequently arises between a local authority and a gas or water company as to the necessity for lowering mains and as to the incidence of the cost of such work. Authorities acting under the Public Health Act, 1875, are invested, by sec. 149 of that Act, with statutory power to alter the levels of the streets vested in them. Sec. 153 of the same Act provides machinery for effecting any consequential alterations of mains, but it is specifically provided that the expenses of or connected with any such alteration shall be paid by the urban authority, except where the burden is laid on the owners of the main by any local Act of Parliament. It should be observed that if a local authority exercise the power of lowering the soil of a street under sec. 149, they are not under any *obligation* to alter mains at their own expense, merely because only a few inches of soil would be left to cover them (*Southwark and Vauxhall Water Company* v. *Wandsworth District Board of Works*, 1898, 2 Ch., 603). The power of lowering, however, must be exercised reasonably, and if it is so exercised, the local authority will be under no liability in an action for damages for injury caused to the property of private individuals (*Boulton* v. *Crowther*, 1824, 2 B and C., 703; see also *Bold* v. *Williams*, 1857, 21 J.P., 84). In such a case, however, the party suffering damage would be entitled to compensation under sec. 308. It should be noticed that sec. 98 of the Metropolis Management Act,

1855 (which deals with the question so far as the Metropolis is concerned), contains no provision at all as to the incidence of the cost of lowering mains, and in *Southwark and Vauxhall Water Company* v. *Wandsworth District Board of Works* (*supra*), the Court took the view that the company had the privilege of laying their mains under the streets without payment, and that they were not entitled to any definite depth of cover. The action, which was for an injunction to restrain the execution of street works in such a way as to leave insufficient cover, therefore failed.

Superannuation.

In emphasising the need for co-operation if the movement in favour of a superannuation scheme for local government officers is to succeed, Mr. J. L. Redfern, the borough surveyor of Gillingham, points out that it is almost hopeless to expect the Government to move in the matter unless there is an irresistible demand on the part of those most concerned. This very practical conclusion was arrived at by Mr. Redfern in a paper on "Superannuation, Security of Tenure and Mutual Protection," which he read at the first meeting of the South-Eastern District of the Institution of Municipal and County Engineers. There can be no doubt that the National Association of Local Government Officers has worked well for the cause of superannuation, and the substantial progress which has been made is reflected in the support of such representative bodies as the County Councils Association and the Urban District Councils Association. It would appear to be superfluous to urge every official to join the Association and so strengthen the hands of those who have undertaken a difficult task on behalf of the whole local government service. In view of the fact, however, that the Association, though a flourishing and increasing body, lacks the practical support of a large number of officials, it may not be inappropriate to point out that it is useless for municipal engineers, to whom we particularly address ourselves, to regard the superannuation question as one in which their claims can be considered apart from those of other branches of the service. It therefore behoves them, in addition to joining their distinctive professional institution, to afford practical support to the National Association.

Mr. Redfern's paper, which will be found elsewhere in this issue, also dealt with the questions of security of tenure and mutual protection. On these subjects our views have often been expressed and are well known. Suffice it to say that Mr. Redfern's observations on all three subjects should be read and digested by every municipal engineer who has the interests of his profession at heart.

Ilkeston.

At the East Midland District meeting of the Institution of Municipal and County Engineers, which was held last Saturday at Ilkeston, the members were officially received by the mayor, who attended at considerable personal inconvenience, inasmuch as he had not completely recovered from the effects of a recent operation. His presence was therefore specially appreciated, and Mr. R. J. Thomas, M.INST.C.E., the president of the Institution, suitably expressed the thanks of the meeting. Of the three papers which were read, one was contributed by Mr. Henry J. Kilford, the borough surveyor and water engineer, and dealt with the water supply of the town. Mr. Harry P. Stokes, the engineer and manager, read a paper on "The Ilkeston Tramways and Electricity Supply." Considerable credit is due to Mr. Stokes for the improvements which have been effected since he took up his appointment three years ago. During the intervening period the operating costs of the tramways have been reduced from 6·85d. to 6·02d. per car mile; the units purchased for lighting have increased from 283,000 in 1909 to 352,000 last year; and the losses in distribution during the same time have fallen from 16 per cent to 3·9 per cent. A paper descriptive of the new sewage disposal works which were opened on Wednesday last was contributed by Mr. Hugh P. Raikes, M.INST.C.E., of Messrs. Willcox & Raikes, the engineers. The electric current driving the distributors is taken from the corporation tramway system, and the most interesting part of the electrical equipment is the automatic control gear. It is believed that the Ilkeston sewage disposal works are the first at which the whole of the work of controlling sewage distributors is done automatically by the introduction of electricity. The meeting, which concluded with some interesting visits to works, was well attended and was a thoroughly successful function.

A Critic of Municipal Trading.

In the course of a signed article that appears under his name in the *Daily Telegraph*, Sir William Treloar makes himself responsible for a rather severe criticism, in general and sweeping terms, of municipal trading. He alleges that in every case where municipal trading shows a profit on an honestly constructed balance-sheet it is where it enjoys a monopoly. The same thing, of course, might apply to companies, such as gas and water concerns, where a monopoly has been established. Sir William has not a good word to say for the administration of the municipal undertaking, because, as he asserts, it is controlled by those who have no special knowledge. Whatever may be the merits or demerits of the committees to which are assigned the responsibility of controlling the various departments of municipal trading, it cannot, we imagine, be charged against them that they show either less ability or less zeal than are ordinarily displayed by company directors. The fact is that as to actual management the municipal undertaking, like the business of the private company, is directed by experts who are generally men of recognised and even high attainments. Most people who look at the matter dispassionately agree that the municipal concern is seriously handicapped when it has to compete with the private undertaking, because of its statutory obligations with respect to the repayment of loans. Neither can it be denied that in respect of certain services, such as water, gas, electricity and tramways, municipal trading has special claims to consideration, because such services are closely identified with the health and welfare of the people.

Town Planning and the Municipal Engineer.

In our "Correspondence" columns will be found a letter in which the writer points out the danger of the architect usurping the legitimate functions of the municipal engineer in regard to town planning. This question was the subject of more than one "Minute" in these columns shortly after the Act of 1909 became law. We then spoke very plainly as to the peculiar fitness of the municipal engineer, both as regards training and experience, to initiate and carry out town planning schemes. His special knowledge of existing evils, his practical experience with the design, construction and maintenance of roads and sewers, and his knowledge of building gained through his duty of supervising the plans and works of architects, alike specially qualify him to deal with questions of town planning. We take the present opportunity of reiterating the view which we then expressed, that town planning is eminently a matter in which those who are, by their daily work, experienced in town development are well qualified to take a leading part. We shall be glad to hear the views of our readers in regard to the questions raised in the letter referred to.

Ilkeston Sewage Disposal Works.

By HUGH P. RAIKES, M.Inst.C.E.

[The formal opening of the works herewith described took place on Wednesday afternoon, the ceremony being performed by the Mayor of Ilkeston (Councillor Samuel Shaw). It will be recollected that the inauguration of the undertaking was originally fixed for September 11th last, but was postponed on account of the Mayor's illness.]

The question of sewage disposal has for many years occupied the attention of the Ilkeston Local Board and Corporation, the waste water and sewage being discharged by means of ditches, pipes and stone drains into the Erewash canal and the river Erewash up to 1883, when the population of the town was about 15,000. In order to prevent the pollution of the canal and river the Ilkeston Local Board in January, 1883, adopted a scheme of sewerage and sewage disposal, prepared by Messrs. Brundell and Simonds, of Doncaster, comprising a main intercepting sewer about 3 miles in length, from Bridge-street, Cotmanhay, to the outfall works at Hallam Fields, this sewer being completed in January, 1884. In order to purify the sewage the local board also acquired about 41¼ acres of land situated on the western bank of the river Erewash, between Gallows Inn and Hallam Fields, 5½ acres being used for intermittent downward filtration and 36 acres for broad irrigation. The town was incorporated in 1887, and continued to grow very rapidly, large numbers of houses being built on land below the level of the main intercepting sewer.

In 1896 low-level sewers were laid by Mr. Kilford, the borough surveyor, from Awsworth-road to Potters Lock, and from Nottingham-road to Gallows Inn; but as the sewage from the latter could not be discharged on to the existing farm at Hallam Fields, three upward flow Ives tanks were constructed at Bridge-street, Potters Lock and Gallows Inn for precipitating the sewage, small areas of land at Potters Lock and Bridge-street being taken on lease from the Duke of Rutland, and about 15 acres were also purchased at Gallows Inn as sites for tanks and for treating the tank effluent by irrigation. Houses continued to be erected at Hallam Fields, adjoining the sewage farm, and owing to complaints from the inhabitants in this district irrigation on the farm was abandoned in 1900, and the sewage of the town [illegible] at the low-level outlets at Gallows Inn and Potters Lock where the Ives tanks had been installed. This resulted in the tanks [illegible] satisfactory effluent seriously contaminated the waters of the river Erewash.

[illegible] dealing with the sewage of the town in an efficient [illegible]

In 1908 the borough surveyor, Mr. Wilkinson, died, and the corporation appointed Messrs. Willcox & Raikes, of Westminster and Birmingham, consulting engineers, to report on the sewage disposal works at the extreme south end of the borough. They further recommended the purification of the sewage by bacteria treatment, consisting in liquefying tanks and percolating filters, for which purpose only a comparatively small area of land was required for constructing the works necessary to meet the requirements of the Local Government Board in regard to the treatment of the sewage before discharging the effluent into the river. The recommendations of the engineers having been approved by the corporation, it was finally decided to acquire a site about 1½ miles from the centre of the town, comprising an area of about 18 acres adjoining the Midland Railway to the east of the Stanton Ironworks on the property of the Duke of Rutland. This site is well adapted for the purpose, as it is readily accessible from the town and well removed from any dwellings, besides being close to the river into which the purified effluent must in any case be discharged, though special precautions have been necessary to prevent flooding. The site was purchased from the Duke of Rutland by agreement, and the engineers were then instructed to prepare a scheme for dealing with the whole of the sewage of the borough, the dry-weather sewage flow of 25 gallons per head for a population of 30,000 being estimated at 750,000 gallons per day.

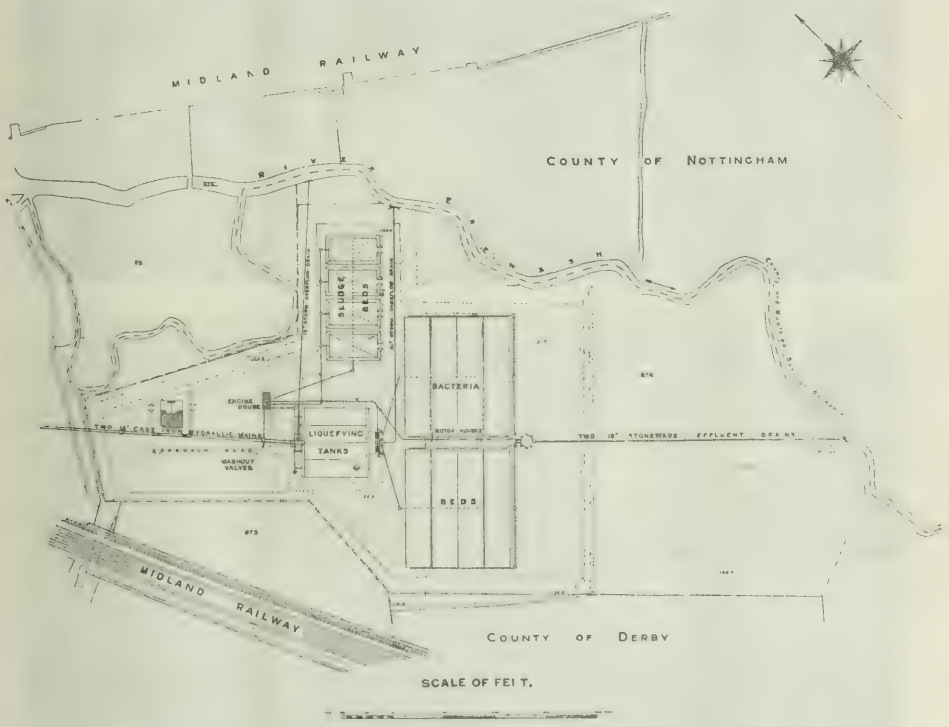
General View of Ilkeston Sewage Works looking East.

Complete plans and estimates were shortly afterwards submitted to the Local Government Board, together with an application for sanction to a loan of £32,600 to cover the cost of the scheme recommended by the engineers. The loan was duly sanctioned by the Local Government Board, and Messrs. Willcox & Raikes were then instructed to prepare the detailed specifications and the other particulars necessary for the purpose of obtaining tenders and carrying out the work. The tender of Messrs. George Bell & Sons, Limited, of Tottenham and Manchester, was accepted for the whole of the structural work, which was commenced in June, 1909. Mr. F. W. Wright being appointed to the position of resident engineer.

[illegible] through the old intercepting sewers to a point on the Hallam Fields Sewage Farm north-west of the Erewash Canal, and from this point it is now taken for a distance of 926 yds. through two new 15in. cast-iron pipes laid in the form of an inverted syphon, under the Erewash Canal and the Midland Railway to a point at the north end of the site of the outfall works. On reaching the outfall works the sewage is first treated in settling tanks and is then [illegible] worked on the percolating system, provision being also made for passing the effluent through a filtering tank before it [illegible] the river. The general arrangement of the works is [illegible] the tanks and engine-house are constructed at the [illegible] the latter beds, which are

rectangular, being immediately to the south of the tanks, and the humus tank still further south. The whole site is surrounded by artificial banks formed out of the surplus excavated material, as a protection against flooding, the banks being planted with shrubs and enclosed by an iron fence all round. The tanks are four in number, each 120 ft. by 31 ft. inside, with an average depth of 8 ft. and a total capacity of 750,000 gallons; but as it is desirable to completely empty the tanks as seldom as possible, a portion of each is cut off by a cross-wall 15 ft. from the inlet end, so that the heavier solids deposited in this portion can be removed without disturbing the rest of the sewage in the tank, the top of the cross-wall being just below the water level, thus forming a weir, over which the sewage passes in a uniform stream when the tank is in use.

The rate at which the sewage reaches the tanks is regulated by means of a weir orifice fixed in the inlet chamber, and so designed that, when the rate of discharge exceeds three times the dry-weather flow, any excess will pass through the settling tank re-



General Plan of Works

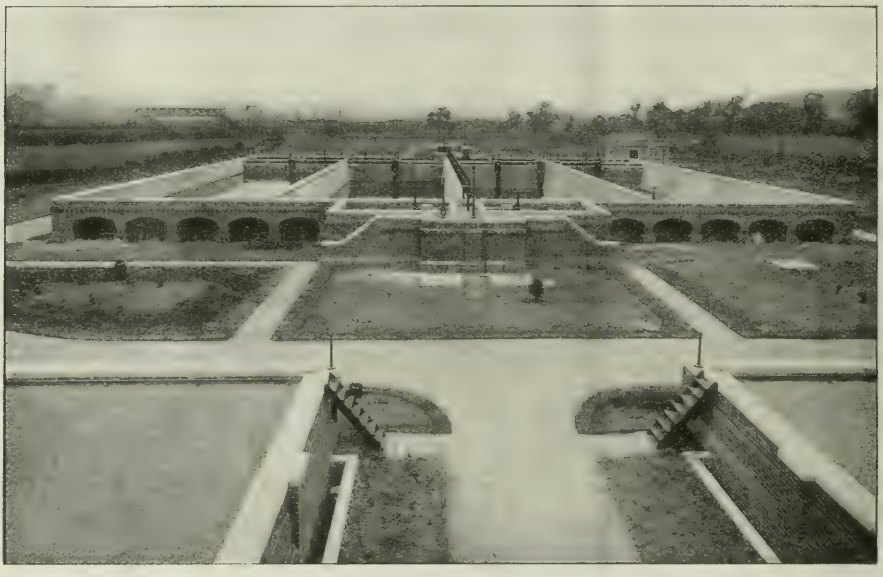
served for storm water, and thence direct to the river. Provision is also made for measuring the sewage which passes to the bacteria beds by means of Messrs. Glenfield & Kennedy's automatic recording instrument.

For the purpose of emptying the tanks, special decanting valves are provided, by which the supernatant water can be drawn off as required and pumped back into one of the other tanks, the sludge being pumped into lagoons, which are described later. The tanks are constructed of cement concrete faced with brickwork on the outside and finished with granolithic coping, the whole of which has been made on the works by the contractors. The floors are also formed with granolithic paving on a concrete foundation, with a shallow channel down the centre of each tank to facilitate the removal of sludge. The effluent from the tanks flows over a weir, and is received in an effluent channel, from which it passes through two 15-in. cast-iron pipes to the bottom of two sedimentation tanks, constructed somewhat on the lines of a Dortmund tank, each 12 ft. square and 15 ft. deep, the bottom of each tank being formed in the shape of a cone. The effluent from these tanks flows over a weir and passes into a channel containing rough-graded granite, to act as a strainer, by which any suspended matter may be removed before it is discharged on to the bacteria beds. The two bacteria beds are rectangular in shape, each 226 ft. long by 200 ft. wide, and 5 ft. deep, with a total area of 10,000 sq. yds., each being divided into four sections for convenience of working. The outer walls are constructed of cement concrete with a brick facing, the concrete floor being finished with granolithic paving in which there are half-pipe effluent channels covered with slotted tiles, the floor and the channels having a 6-in. fall from the centre of the beds to the outside. For the purpose of discharging the sewage on to the rectangular bacteria beds, a special type of distributor was designed by the engineers for use at Hanley, where they have proved very successful, and a similar system has therefore been adopted in this case, so a short description of their construction may be of interest.

The sewage distributors have been manufactured by Messrs. Hartley & Co., engineers, Stoke-upon-Trent, and are shown in one of the illustrations, being arranged to discharge over ½ acre units, each 226 ft. long by 100 ft. wide. An open steel trough, 1 ft. 10 in. wide and 1 ft. 11 in. deep, is provided between each ½-acre unit, and the troughs are fixed perfectly level, the bottom being 6 in. above the surface of filtering material, and they are carried on two rows of 6-in. by 6-in. reinforced concrete pillars fixed in the floor of the bed. The sewage is drawn from each trough and discharged into the perforated distributing arms by means of travelling syphons, each distributor forming one complete arm extending on either side of the trough. The arms travel backwards and forwards the whole length of the bed, meeting and passing each other when at the middle of each journey, the motive power being provided by electric motors and wire ropes. The distribution of sewage takes place when travelling in one direction only, thus giving a uniform interval of rest between each dose of sewage as well as a uniform rate of discharge.

The construction of distributing pipe is shown in the illustration, the sewage passing into the nozzles from the main pipe at the top, so that this pipe is never emptied, and the discharge of the sewage

therefore commences and stops along the whole length of the pipe almost instantaneously, and any deposit in the bottom of the main pipe cannot obstruct the outlets to the nozzles. The top of each nozzle pipe is closed by a plug, and when this is withdrawn the greatly vary the amount of sewage distributed by increasing the time of the flow journey and decreasing the time of the idle journey, and the periods of rest can also be adjusted and controlled until the best results are obtained.



Settling Tanks looking West.

apertures can be easily cleaned, while a baffle plate beneath each nozzle sprays the sewage and distributes it over the filtering medium, so that when the nozzles are discharging there is a continuous film of sewage falling on the whole width of the bed. Between the syphon and the main distributing pipe is a valve

The main distributing pipes are drawn along the rails by wire ropes, and as they would require considerably more power during high winds if independently driven, they are connected together by a balancing rope, which passes round grooved pulleys at each end of the bed. When wind adversely presses against

Bacteria Beds looking North.

operated by levers, so that the distribution of sewage is automatically stopped or started when one of these levers encounters a stop fixed in the end of the trough. As both main pipes distribute on one journey and are idle on the succeeding journey, it is possible to

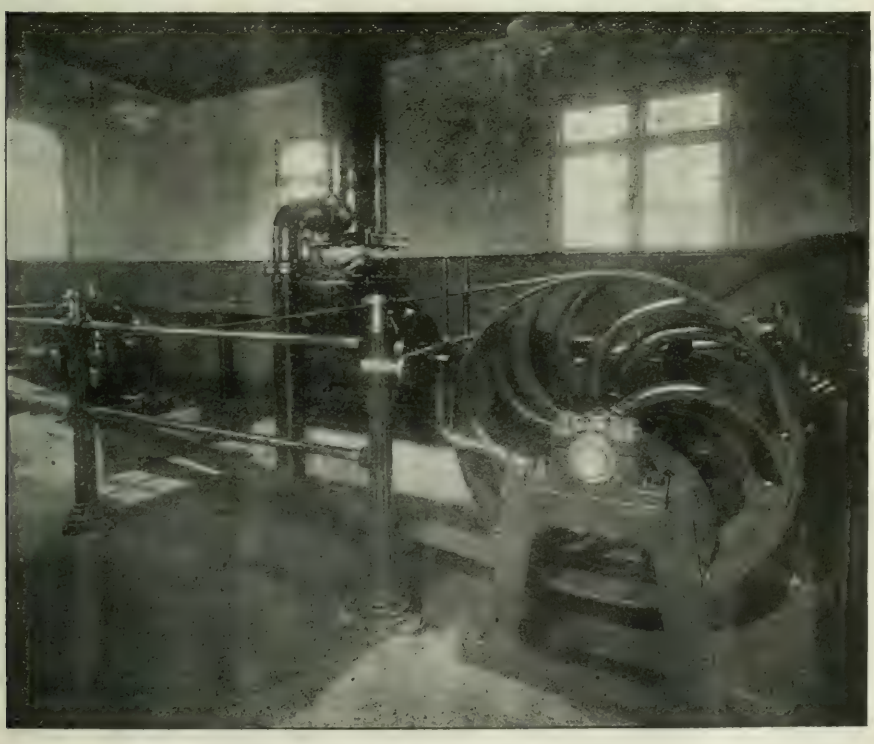
one distributor, its effect is largely counterbalanced by the wind pressure against the distributor on the opposite side of the trough, so that a very small electric motor is sufficient for the work, only 1½-horse power being required to drive each ¼-acre distributor.

The ends of the wire ropes are secured to and bound upon a revolving drum, so that one end of the rope winds up as the other unwinds, and when the arms reach the end of the bacteria bed the direction of the revolution of the drum is automatically reversed, the distributors then proceeding upon the succeeding journey, and on its completion the motion of the drum is again reversed. The reversal of the winding drum at the end of each journey is accomplished by a screw which revolves with the drum, there being a nut on the screw which travels along its axis until the required number of revolutions have been made, when the nut encounters a pedant lever and throws over the belt-striking gear, thus reversing the motion of the drum and arms. The nut then travels in the opposite direction until the end of the succeeding journey, when it engages in a second pedant lever, so that the motion is again reversed.

The distributors have been designed so that they can uniformly distribute a dose of sewage of from 1 to 2 gallons per yard over the area they cover at intervals varying from five to ten minutes as desired, and each ¼-acre distributor on working twenty-four hours consecutively is capable of discharging 500,000 gallons during that period. The whole of the rails on which the distributors run are supported by 6-in. by 6-in. reinforced concrete piers built into the floor of the beds, and finished by means of a cast-iron cap with bolt holes, to which the rails are attached.

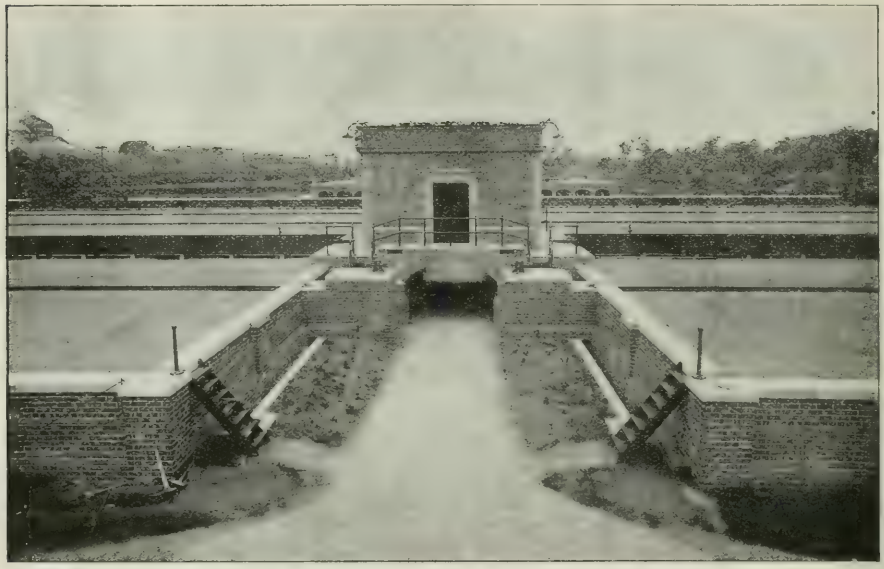
The electric current driving the distributors is taken from the corporation tramway system (voltage

Sewage Distributors looking East.



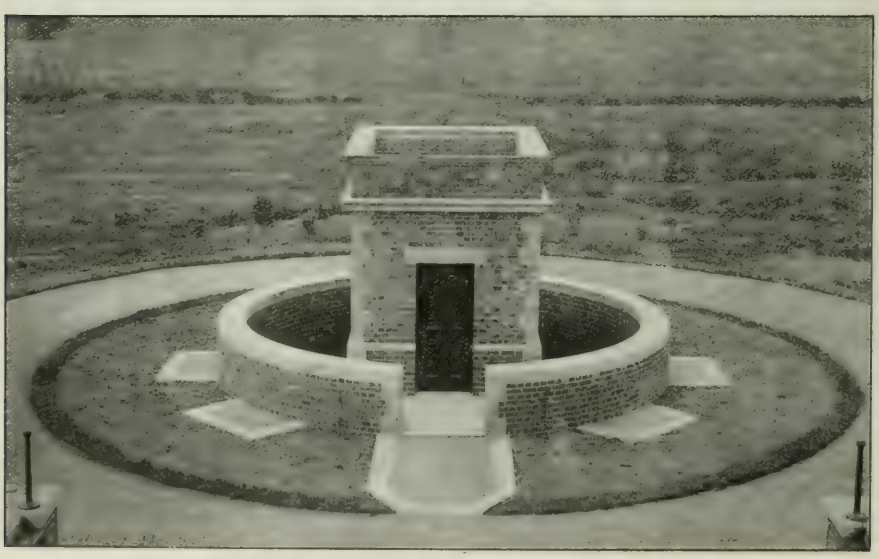
Interior of Engine-House.

500 d.c.), the cables being brought underground from the tramway terminus at Hallam Fields to the sewage works for a distance of about ½ mile. The motors are 3 b.h.p., and are capable of being used on any voltage from 450 to 550, being provided with resistance strips across the ends of the series winding, which can be altered on the site to suit the actual line voltage. When the ordinary power mains of the corporation are extended as far as Hallam Fields the electric current will be taken from these instead of the tramway, and the motors will then be altered to work with the 460-volt current. The whole of the motors with two loose and one fast pulley on the reduction train, the motor, running in one direction only, is enabled to drive the drums carrying the haulage ropes of the distributor alternately first in one direction and then in the other, so that the distributor travels backwards and forwards over the bacteria bed, without requiring any manual control, in the manner already described.



Motor-House looking North-West.

The most interesting part of the electrical equipment is the automatic control gear, and this is believed to be the first occasion where the whole of the work of controlling sewage distributors is done automatically by the introduction of electricity. At the outlet end of the liquefying tanks there are two chambers from which the tank effluent is conveyed direct to the distributor troughs by means of 15-in. cast-iron pipes; and in each of these chambers there is a special



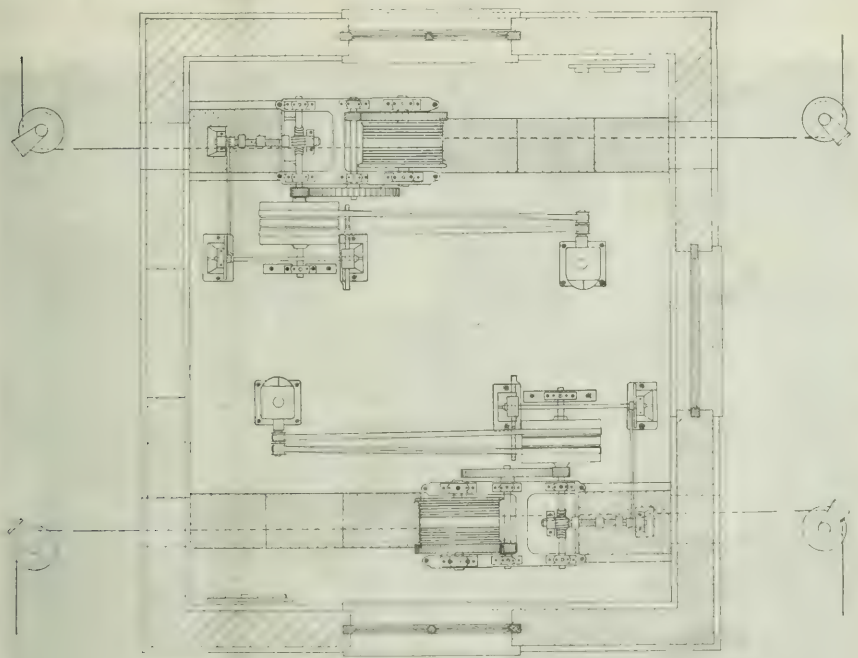
Motor-House and Humus Tank

used in connection with the sewage disposal works are identical in design and interchangeable, so that repairs can be made without involving the stoppage of the plant for any length of time. By means of straight and crossed belts from the motor pulley,

float switch which controls the supply of tank effluent to the troughs. When the water in the chamber rises 3 in. above a certain level the float is lifted, at the same time pushing up a brass rod which engages and throws in a quick break-knife switch. At each succeeding 3-in. rise in the water level the same operation is repeated, and as the water level in the chamber falls the reverse action takes place. The two switch boxes are interconnected, so that when the pair of beds connected with either switch is not in use the other switch box will still be in operation; and should any defect occur in one, the other will continue to operate the motors. From these boxes pilot wires are run on to the main switchboard in the first motor-house, on which there is a selector switch so designed that by turning a brass pointer travelling over a numeral plate attached to the front of the switch the number of the distributor to which the pointer is set will first come into operation. As the float continues to rise the distributors will come into use automatically in correct sequence, and as the water falls they will also automatically fall out of operation. The distributors themselves are numbered 1, 2, 3 and 4, and if it is assumed that No. 3 distributor is the one which is first required to come into operation, then the order of starting up would be 3, 4, 1, 2, and they would fall out in the sequence 2, 1, 4, 3; but no matter which motor is started first, the sequence is always the same, so the attendant only has to set the selector switch to the number of the distributor which he requires to be first operated.

The method of starting up the motors is as follows: The current passes from the main supply through the float switch, then through the selector switch to a magnetic coil on the motor starter. As soon as this coil is magnetised it pulls up the arm of the switch, gradually starting the motor until it is up to full speed, when the main switch is closed and the motor continues running until the float switch goes off; the magnetic circuit is then broken, allowing the starting switch of the motor to fall down, thus stopping the motor. In order to ensure that the distributor will always stop on the non-distributing journey an auxiliary switch has been provided on the "throw-over lever," which is brought into operation by the belt striking gear, so that the motor is always kept running when the distributor is actually distributing sewage on the beds. Each motor-house is provided with its own starting gear and distributing panels but none of this gear will be operated by hand except in case of repairs, when, by pulling out the switch controlling any particular bed, the corresponding motor is put out of operation. Pilot lights have been fixed on the top of each motor-house (one for each motor), so that the man in charge of the works at night can always see from any point which beds are at work and which standing.

In order that each bed may do approximately the same amount of work, an automatic electrical recorder is also provided in connection with the float gear to show the number of hours that each motor is actually working. The charts from this instrument will enable the manager to work the beds uniformly and give each its required period of rest, as he can readily ascertain the quantity of sewage treated on each section. The electric motors, pumps, and switchboards have been supplied by the Rees Roturbo Manufacturing Company, while the automatic gear has been supplied by the Adams Manufacturing Company to the specification of the borough electrical engineer, Mr. H. P. Stokes, in order to meet the special requirements of Messrs. Willcox & Raikes' scheme. The winding gear, motors, and switchboards previously described are erected in two motor-houses (two sets of machinery in each), which are built on arches carried between the two bacteria beds, as shown in the illustration No. 8. These motor-houses are 17 ft. by 15 ft. inside and 10 ft. from floor to roof, the walls being constructed of brickwork with York stone plinth, cornice, and coping. Inside, the walls are finished to a height of 6 ft. with brown glazed brickwork, and above this they are plastered and distempered. The roof is composed of cement concrete carried on joists and finished with a ¾-in. coat of asphalt, the floor of the house being finished with red tiles, and the gangways round the house are paved with 2-in. granolithic paving.



Plan of Motor-House.

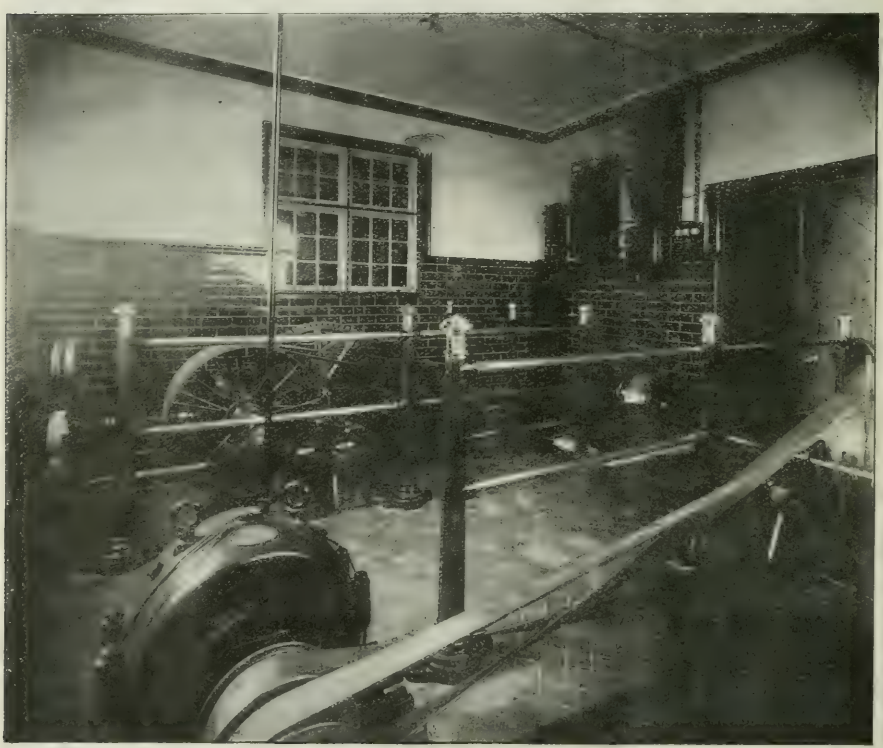
The efficiency of a percolating filter not only depends on the uniform distribution of the sewage over the surface of the bed, but also on the selection and grading of a suitable filtering material. Very exhaustive inquiries were therefore made in the surrounding district to determine the most suitable materials available for filling the beds, an experimental filter being also put down on the old sewage farm and worked for approximately twelve months for the purpose of comparing the results obtained with granite, clinker, coggar, and slag or furnace

cinder. It was found to be practically impossible to obtain the whole of the 16,000 cub. yds. of material required from any one source within a reasonable time, so it was finally decided to have 1 acre of granite, ½ acre of clinker, and ½ acre of slag. The granite was supplied by the Croft Granite Company, the clinker by Mr. Frank Keep, and the slag by the Stanton Ironworks Company, the sizes of the material varying from 2½ in. to ¼ in., the smaller size being placed at the top of the filters and the larger at the bottom. The whole of the filtering material has been most carefully crushed and screened by specially constructed machinery in order to remove dust and secure uniformity of size, in accordance with the specification. The sewage, after being distributed by the nozzles of the distributors over the surface of the beds, percolates through the filtering material to the underdrains and from these into the main effluent channels, which discharge into the circular humus tank. This tank is 21 ft. diameter and 28 ft. deep, of the Dortmund type, with a cone-shaped bottom; the cone is constructed of concrete reinforced with ½-in. indented steel bars, and the walls are built in brickwork finished with York stone coping carried about 3 ft. 6 in. above ground level.

The filtered effluent is delivered into this tank by means of an 18-in. steel tube, which is carried down vertically to within 8 ft. of the bottom of the cone; the final effluent then rises upwards, and passes out of the tank over a series of weirs into the main outlet chamber, from which it flows direct to the river Erewash. A house is built over this tank, similar in construction to the motor-houses, in which a vertical spindle Rees-Parker enclosed motor is erected, developing 4 b.h.p. at 1,000 revolutions per minute on 500 volt continuous current. This motor is directly coupled by means of a vertical shaft, 10 ft. long, to a Rees Roturbo self-regulating centrifugal pump for emptying the tank or removing the deposit therefrom, and capable of delivering 10,000 gallons per hour against a total head of 33 ft., this pump being fixed on girders built into the walls of the tank with the suction pipe carried to the bottom of the cone.

The sludge from all the tanks is delivered to a pump well, which is constructed underneath the engine-house shown in the illustration No. 10. This pump well is 29 ft. long by 14 ft. wide, and about 14 ft. deep, built on a concrete foundation, with the walls constructed of brickwork in cement, backed with clay puddle. The well is divided into two by a brick wall, the compartments being connected at the bottom by a 12-in. pipe and penstock valve. Built over this pump well on concrete jack arches and steel joists are the engine-house and store-room; the former is 20 ft. by 14 ft., and 8 ft. 6 in. to the underside of the roof, and similar in construction to the motor-houses already described, except that it has a slate roof instead of concrete. In this engine-house there is a double-acting horizontal sludge pump, capable of delivering 16,000 gallons of sewage per hour, against a total head of 27 ft. when running at a speed of 23 revolutions per minute. For driving this pump a 6½ b.h.p. Rees-Parker enclosed motor is provided, similar in every respect to those previously described for driving the distributors.

The sludge from all parts of the works is delivered into one of the compartments of the pump well and pumped to the sludge lagoons, which consist of four beds, each 97 ft. long by 47 ft. broad, so constructed that the liquid matter drained out of the sludge is collected by the drains and discharged into the second compartment of the pump well, from which it can be pumped back into the tanks through a 5-in. rising main. The solid sludge will be left on the lagoons until it is sufficiently dry to be carted out on to the land at the south end of the works. The electric current for lighting is provided from the ordinary lighting mains, and is connected up at the Hallam Fields terminus, overhead aluminium wires being taken to the works, where a disconnecting pillar is fixed for isolation and testing purposes. This pillar is fitted with a main switch, fuses and meter, and the current is distributed where required on the works by twin wires laid underground, insulated with paper and lead covered. Lighting standards and lanterns have been supplied by Messrs. Lucy & Co., of Oxford, and carry four 50-candle power metal filament lamps, and each of the outside fittings is controlled by separate



Interior of Motor-House.

double pole switches and fuses attached to the standard itself, which are operated by means of chains. A manager's house and workman's cottage are to be erected near the entrance to the works at the north-east corner of the site, where provision will be made for telephonic communication with the corporation's electricity station. A good supply of water is provided by a 1-in. service pipe connected with the town water main. The whole of the above works have been carried out and completed under the immediate supervision of Mr. F. W. Wright, without incurring any extra expenditure beyond the amount of the original contract, which was well within the engineer's estimate of £32,600, submitted to the Local Government Board in January, 1909. Practically all the work has been executed within the time specified, including the various subsidiary contracts for machinery, &c., as well as the main contract undertaken by Messrs. Bell & Sons.

SURFACE TARRING.

COUNTY ENGINEER ON ITS LIMITATIONS.

Mr. H. T. Wakelam, M.INST.C.E., county engineer of Middlesex, states in his fourteenth annual report that extensive tar-painting was carried out in the summer of 1911 on the main roads under his control, "which work," he says, "no doubt prevented disintegration of the carriageway surfaces. The latter, owing to the excessively hot and dry weather experienced last year, would undoubtedly have suffered to some extent otherwise. The exceptionally wet autumn which followed the dry period, and the sharp winter weather, caused much damage everywhere to water-bound macadam roads, and their tar-painted surfaces went quickly to pieces, rendering scavenging operations somewhat difficult."

Mr. Wakelam adds: "It would not perhaps be misplaced if I first mentioned that it is I think generally understood and accepted that surface tarring is intended only as a palliative for the dust nuisance from motor-car traffic, and that it is not meant to be in any way a permanent surfacing. Its life is only expected to last through the "dust" season, in which connection (if the work be properly carried out) its efficiency and results need no comment.

"With the extension and increased traffic of motor cars, motor omnibuses, and other heavy motor and mechanically propelled vehicles, tar painting must more than ever be considered to be of a temporary character only. But, even so, it will, to my mind, be the best palliative for dust until some kind of surfacing is discovered which, from a point of view of efficiency and economy, will recommend itself for common use to provide for the various classes of traffic now on the roads."

Royal Institute of British Architects.—The second examination of Licentiates desiring to qualify for candidature as Fellows will take place in December next. Full particulars of the examination may be obtained on application to the secretary.

The Ventilation of Sewers.—The arguments in favour of omitting the house trap for the purpose of increasing the ventilation of sewers are stated by Mr. R. L. Fox, of the Batavia (New York) Sewer Commission, in the *Cornell Civil Engineer*, as follows: (1) Omission of the house trap permits a better discharge of house sewage and prevents solid matter from settling in the soil pipe. The air from house plumbing is usually worse than sewer air. (2) It simplifies and reduces the expense of plumbing. (3) It obviates the frequent clogging of the house connection which usually occurs at this trap. (4) It reduces the danger of illuminating gas from leaky mains reaching the house, as the omission of the trap allows the gas to pass freely up the stack and be harmlessly dissipated into the air. (5) Scientific examination in Paris, London, Boston, and several of the largest cities in the world proves conclusively that the air in the trapped soil pipe is more dangerous to health than the sewer air, and free circulation of air throughout is the best remedy for both sewer and soil-pipe air, as they are harmlessly dissipated into the air above the roof, and the fact that there is a free circulation of air throughout the system prevents the formation of dangerous gases in quantity, for the reason that as rapidly as made they are dissipated.—From *Engineering and Contracting* for September.

SOME RECENT PUBLICATIONS.*

Transactions of the Institution of Water Engineers. Vol. xvi. 1911. Edited by Percy Griffith, M.INST.C.E., F.G.S., Secretary. London: The St. Bride's Press, Limited.

The papers included in this volume are of great interest, and include "The Geology of Dam Trenches," by H. Lapworth; "The Filtration of Public Water Supplies and their Sterilisation by Ultra-Violet Rays," by W. Clemence and Dr. Max de Recklinghausen; "The Water Supplies of the River Basins of England and Wales," by W. R. Baldwin-Wiseman; "Portland Cement on Public Works," by G. T. Edwards; and "Waterworks Management," by E. Devonshire and W. Matthews. All these papers have already been noticed individually in the columns of The Surveyor. In addition to a record of the "Proceedings" of the Institution, the volume contains a library catalogue, a digest of legal cases, a summary of contents and subject index of Vols. i. to xvi., and much other matter which will be appreciated by water engineers.

"Southern England Coast and Countryside" (London: The Homeland Association, Limited. Price 1s.). "Where to stay, what to see, and where to live" comprehensively suggest the problem this attractive volume is well calculated to solve. It is, in brief, a topographical survey, in word and picture, of the coast from Herne Bay to Swanage, including the cathedral cities in its area. An excellent feature is its special articles, in which E. W. Harvey Piper deals with these cathedrals, A. H. Anderson with "The South Country" generally, and others with the bibliography of the district, and its motoring, golfing, angling, educational and other facilities. The present reviewer would have been pleased if his own works on Surrey and Kent (one of which is published by the Homeland Association) had been included in the bibliography, and he would have welcomed the inclusion on p. 67 of many other Surrey golf links, on p. 82 of the excellent Kursaal Theatre at Bognor, and in pp. 201-207 of the Schools of Surrey. On the whole, however, the volume is remarkably well conceived and carried out, and is a marvel of cheapness.

The Salon: A Review of Architecture and the Allied Arts. Vol. I., No. I. (Sydney: Weston, Wilson Co. Price 1s.).—This is the title under which, in future, will appear the official journal of the Institute of Architects of New South Wales. It will not be a technical journal only, but will aim at fostering the interests of cultured readers, and generally encouraging and assisting those who desire to increase their knowledge of the fine arts. Meanwhile, the first issue is a sumptuous production worthy of the journal's high aim, well printed and illustrated. Articles on the "Federal Government House, Sydney," and the "Federal Capital Competitive Designs," are conspicuous features of its literary matter. We would suggest that a "Table of Contents" be somewhere included in future issues, and that title and details as to date of issue be printed on the back edge of each part.

A Hong Kong Appointment. The secretary of the Royal Institute of British Architects is requested to invite applications for an appointment at Hong Kong. Candidates should be Associates of the Royal Institute, between twenty-five and thirty years of age, experienced in steel construction, and with some knowledge of quantities. A good salary is offered. Applications, with references and qualifications, should be forwarded to 9 Conduit-street, W.

Workmen's Cottages.—Mr. W. Bevan, borough surveyor of Haverfordwest, writes: "In reply to your note under this heading in last week's Surveyor I beg to say the Haverfordwest Town Council have erected fourteen houses for the working classes under my designs and supervision. The population of the borough is only about 6,000, but should your correspondent be desirous of having further information regarding my housing scheme, I shall be pleased to furnish it on hearing from him." It will be recollected that in our issue of September 20th a correspondent asked for the names of any medium-sized towns (say of between 15,000 and 20,000 inhabitants) where cottages for the working classes have been erected by the local authorities.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

Superannuation, Security of Tenure and Mutual Protection.*

By J. L. REDFERN, Borough Surveyor of Gillingham.

It seems almost superfluous to discuss the desirability of superannuation; every one is so familiar with the arguments in favour of it. The principle has been recognised by railway and other companies to be fair and just and advantageous from a commercial point of view. Several municipalities have adopted schemes; but of the staffs in the national and local government services, those employed by county, municipal, and similar authorities, if we except the police and elementary teachers, are alone unprovided with an official scheme of superannuation; yet in character and quality of work, in status and class, they are equal to their colleagues in the other services.

The great advantage of a superannuation scheme to employers is that they are provided with a means of gracefully dispensing with the services of old and exhausted officials who have given their best to the commonweal, but whose emoluments in the smaller towns and districts are so small that they are sorely tried in their efforts to provide for old age, and usually find it impossible to do so if they are to maintain their position and bring up their families respectably. With approaching old age and impaired powers for service on the part of officials difficult situations arise owing to the need of employers for the services of younger men. These situations are bridged sometimes by retaining old officials in nominal but paid capacities; but this is the exception. Thus we have, on the one hand, employers desirous of getting rid of old and worn-out employés and, on the other hand, old employés who, having borne the burden and heat of the day, are anxious for some means of escape from duties grown too arduous for their declining strength.

Contributory superannuation meets such cases splendidly, for, while compelling thrift on the part of officials, it provides the solution which the employers desire. At the appointed age the old employé retires honourably on his deferred pay, the employer obtains the services of younger men who are more up-to-date because more recently equipped, and every one is satisfied. Fortunately there is a superannuation scheme for Local Government officers now within the region of practical politics. The provisions contained in the draft Bill of the National Association of Local Government Officers are very fair, being based on a scale of contributions ranging from 3 per cent to 6 per cent.

We must all agree that this scale of contributions appears very ample when we compare it with that of poor-law officials, whose scale ranges from 2 per cent to 3 per cent. We are told that the actual cost of the scheme of the latter (that is, the difference between contributions and the amount paid out) is equivalent to a rate of only 1-10th of a 1d. in the £, and it is estimated that the charge on the rates of the National Association of Local Government Officers' scheme would amount to rather less than 1-12th of 1d. in the £, which ought not to frighten anybody.

But superannuation is not yet attained, although the National Association of Local Government Officers continues its efforts vigorously. That body, which in [illegible] years has obtained a membership of 30,000, and [illegible] is busy trying to strengthen its organisation by [illegible] the active support of every Association connected with county, municipal, urban, and rural authorities, has devoted an immense amount of time to the Superannuation Bill.

[illegible] has deputations promised its support to the Bill, while suggesting certain [illegible] The Urban District Councils Association [illegible] to the Bill and the Association of Municipal Corporations [illegible] the question to its Law Committee. The National Association [illegible] deputation [illegible] Labour [illegible] Members ready to deal with it and has furnished them with information; but for the moment we must work and wait.

[illegible]

The impression prevails in some quarters that it is only necessary to ask for benefits and they will forthwith be obtainable, and a little restlessness is shown sometimes at the apparent delay, the fact being overlooked that superannuation has to be fought for as well as paid for.

What is wanted is greater co-operation among members and a ceaseless campaign, because it is almost hopeless to expect Government to render assistance until there is an irresistible demand, notwithstanding the fact that it has recently dealt with the question of superannuation for teachers by assisting them to the tune of £200,000.

Until recent years there has been a singular lack of combination among local government officers, who outside their official duties have had as few dealings with each other as Jews with Samaritans. The Trade Union movement has taught some useful lessons which we are slowly but surely absorbing, the chief one being that only by combined and persistent effort can an improvement in the conditions of any branch of service be attained.

Until the principle of National Old-age Pensions was established it was generally thought that the Government could not be induced to favour any more special schemes of superannuation, as it would savour of class legislation, and the official classes can hardly be described as the bottom dogs. Now, however, there cannot be any reason why we should not fight for it and obtain it.

It cannot be expected, of course, that superannuation and security of tenure can be obtained solely for municipal and county engineers and surveyors, and isolated action on our part would probably prove abortive. There is the other alternative however—namely, the co-operation of every member of the local government services. Parliament, municipal authorities, and the public must be educated, and the assistance of the Press sought and obtained. Municipal officers must arouse themselves out of the apathy which has been a stumbling-block in the past, and wage a ceaseless campaign throughout the country.

Powerful support should be given to the National Association of Local Government Officers which, because it is representative of every grade of local government officer, is more likely to achieve the end desired than any other organisation, provided it is possessed of adequate funds. Our own Institution contributes £6 6s. per annum to the National Association's funds (equal to about 1½d. per member), and sends two representatives to its meetings. To me this support appears to be ridiculously small, although it is all that has been asked for; but surely the contribution should be increased very considerably.

Every member of our Institution who has not joined should become a member of the National Association of Local Government Officers.

Every local authority in the kingdom should be petitioned for support to the superannuation scheme. This is a necessary prelude to any advancement with the proposal, because it is the local councils who, when superannuation is granted, will have to pay the difference between the contributions and the benefits, and it is quite clear that the Government will never be inclined to place any further financial burdens upon local authorities unless it can be shown that the local authorities themselves are generally agreeable. Members of local authorities are, in the main, sympathetic at the present time, though they do not care to say so.

[illegible] of local authorities

There was a time when the question of security of tenure and mutual protection scarcely needed to be [illegible] by municipal officials. In those days the character of public authorities was wholly different to what it is to-day. The members of them were largely people of the leisured class who had time at their disposal to give to the public affairs of their locality. Their tenure of office was considerably longer than now, so that officials could rely, year after year, on the continuous support of elected employers while prosecuting the various schemes for the benefit of the public. But a great change has taken place in the composition of

* A paper read at the [illegible] meeting of the South Eastern District of the Institution of Municipal and County Engineers, held at Maidstone on Tuesday, September 24th.

public bodies, particularly in industrial centres, and it has destroyed to some extent continuity of office and policy. The class of member before referred to is gradually disappearing, and is being succeeded by men with less respect for tradition. This metamorphosis causes a good deal of friction, and in the clash the lot of officials is not always improved.

The rate at which the constitution of public bodies changes is remarkable, a few years sufficing to replace most of the members. The consequence is that the good work that officials may have done is often lost sight of by those who come fresh upon the scene. In a word, the modern official has continually to educate recruits to public bodies, and there is no finality to the task.

No official need be too thin-skinned if he can always count on the support of the public body he serves should he be harassed by any one in the discharge of his duties. But we are often hearing of cases where an official, besides having to bear the embarrassment of attacks from outside, cannot rely on the council to defend him or see him through.

OPPRESSED OFFICIALS.

Moreover, a cheap and entertaining sport has arisen known as "official baiting," indulged in by those foolish members of public bodies who delight to take advantage of an official's inability to retaliate. It is comforting to know that those who indulge in it do not, as a rule, achieve success, though they please a certain class of the gallery ratepayers; but they can, while the sport continues, afford a considerable amount of exquisite pain to a sensitive official.

The harassing of officials is as unprofitable as it is senseless, because it tends to sap all enthusiasm for work and quenches the spirit of endeavour in an official. The general public who read reports of official baiting think that they too are justified in abusing the officials, and mud thrown in this way has a tendency to stick unless some effort at repudiation is made. It is not to be wondered at, therefore, that most of us believe that the time has arrived when some measure of security and protection should be obtained.

We are all glad to see that our own Institution of Municipal and County Engineers has awakened to the necessity for taking active measures towards securing for its members the benefits of superannuation and security of tenure, and is alive to the great need of mutual aid and protection. The Council of the Institution, finding that the new memorandum, as amended by the Board of Trade, precluded the use of the institution's funds to defray costs incurred by a member in a libel action, did the next best thing—namely, at once to start a subscription-list in aid of a surveyor who has been a victim of persecution and who finds himself, after having won his case and vindicated his character, with a heavy bill to pay.

THE INSTITUTION DEFENCE FUND.

At their last meeting the council took into consideration the appointment of a Mutual Defence Fund Committee, and the matter has been referred to the Constitution Committee. The proposal is to create a fund independent of the finances of the institution available for the defence of oppressed officials. The suggestion has been made that it should be started on the basis of a voluntary contribution of 5s. per annum per member, which it is thought may prove sufficient for the purpose.

That there is great need for such a fund is very certain, because the council has a number of times been approached by some member who has sought financial aid in making his defence. Again, the council has often been asked to help an official by making a remonstrance to his authority when the official in question has been warned (for no apparently good reason) that his services would be dispensed with. But the council has not hitherto been able to do much except sympathise. It is true that, in some instances, the institution has deputed one or more of its members to interview the authority on behalf of the official, but with little result.

There is a certain amount of security of tenure involved in superannuation itself, and this defence fund is very good in its way, and better than nothing at all, but most of us feel that since we have to administer Acts of Parliament we ought to be protected by Act of Parliament.

The duties thrust on officials in these days are very numerous when Acts of Parliament succeed each other with bioscopic rapidity. The application of these Acts gives rise to a good deal of public irritation, which often finds vent on the officials.

NEED FOR PARLIAMENTARY PROTECTION.

Officials are of necessity continually treading upon the toes of members of their own public bodies, and of the ratepayers at large, in carrying out the duties which Parliament thrusts on the authorities and requires the authorities to carry out through their officials. Those members of the general public who feel themselves aggrieved by the requirements of these Acts do not hesitate to attack the unfortunate officials who have to carry out the Acts. It is not too much therefore to expect that a Government which imposes upon officials the carrying out of duties which prove so repugnant to those for whom the Acts are framed ought to protect officials and thus enable them to discharge their duties fearlessly, without respect of persons, and without the haunting fear that their bread-and-butter is at stake.

Now, for one official who will go to the trouble of defending himself against an offender who slanders or libels him there are numbers of others who feel that they dare not, because of the insecurity of their position and the risk of having to pay costs themselves, and it would be a tremendous support to officials if they had superannuation and security of tenure, and could in addition rely on the moral and financial assistance of our Institution.

What one cannot understand is why security of tenure is good for officials in some branches of public service but not in ours.

It is well that officials of all classes have banded together and formed such an Association as the National Association of Local Government Officers where interests which affect all will be pushed as vigorously as possible, and it is important that every institution and society which deals with the welfare of local government officials of any class should bear this important question of superannuation and security of tenure well in mind, and let it occupy the first place in its considerations.

SECURITY OF TENURE.

If the situation which occurs when dealing with old servants who find they are unable to carry out their duties as formerly is suitably and profitably compassed by a scheme of superannuation at very little expense to local authorities, so that they are in the position of being able continually to have the services of able and fit men, would it not also pay every authority for its officials to have security of tenure, because then the authorities would know that their officials could more fearlessly carry out all the duties imposed upon them?

It is believed that there is considerable opposition at the Local Government Board to the proposal to give security of tenure to surveyors, the very board which ought, of all, to be readiest to give support, because it is that department which is responsible for most of the work that is thrust on the surveyor.

And what is the objection to security of tenure? Is it that the authority would not be able to get rid of undesirable officials? Now, this is not true, because under any system of security of tenure, when an official did not carry out his duties satisfactorily complaint would be made to the Local Government Board, and sufficiently good grounds for his dismissal would free the authority from his service. Does poor-law administration suffer through poor-law officials having the advantages that we desire? Whether it is because, as a body, we have no charter or not, one cannot say, but why the Local Government Board should approve of the principle of security of tenure for a medical officer of health and not a surveyor passes one's comprehension. The fear that it might establish a few unscrupulous officials is groundless, when any unscrupulous act would of itself be a justification for the removal of that official under any system of security of tenure. A strong representation should be made to the President of the Local Government Board on the subject, to hear his views and let him know ours about this matter.

Our organisation must be strengthened, the authorities and members of Parliament must be invoked to support the principle of superannuation and security of tenure, and we must not let our efforts flag until we have achieved what poor-law officials enjoy. This is a very vital subject, which ought to commend itself to every member of our institution and be thoroughly ventilated at the district meetings.

Sewage Disposal by Oxidation Methods.

By JOHN DUNCAN WATSON. M.INST.C.E., Birmingham.

[The subjoined paper was read last week before the members of the 15th International Congress on Hygiene and Demography, Washington. We defer our comment on the contribution until next week, when we propose to reproduce a companion paper submitted to the congress by Dr. Gilbert J. Fowler, Manchester.]

In using the words "sewage disposal," sanitary engineers have more in their minds than merely conveying an objectionable liquid beyond the reach of the masses, and when they speak of "purification of sewage" they think of something less than a complete elimination of those substances from potable water which when added to it gives the liquid the designation of sewage. Complete elimination is prohibitive, inasmuch as it is beyond the limits of a reasonable rate on the public purse. The word "purification" as it is employed in this paper should therefore be understood in this restricted sense.

There must, of course, be some standard to guide the designer of a sewage purification plant, but what that something should be it is difficult to say. It is not difficult, however, to say that it should not be 1 part per 100,000 albuminoid ammonia and 1 part per 100,000 oxygen absorbed as in Lancashire and Yorkshire. A standard should be more or less of a movable quantity, high where the river into which the effluent to be discharged is pure, and not so high where the river is impure and of great volume.

On the whole, the condition of the river below the point where the effluent joins it is a safe guide, and should be the ruling factor in determining the degree of purification desirable. I suggest that the designer of the plant should aim at producing—

(1) A sewage effluent that will not putrefy on being kept for seven days at a uniform temperature of 80 deg. Fahr.
(2) That it should be the result of natural processes.
(3) That it should not contain more than 3 parts per 100,000 of suspended solid matter.
(4) That it should not absorb oxygen from the stream into which it flows.

ELIMINATION OF SOLIDS.

In purifying sewage by oxidising methods it is essential first to separate the solid from the liquid impurities, not because it is impossible without nuisance to purify crude sewage on oxidising beds, but because such a course is far from economical. The sludge question is to be introduced by Dr. Imhoff; it is therefore unnecessary here to discuss it, beyond emphasising its importance in every scheme of purification. The success of every oxidising process is more or less dependent upon the efficiency of the methods adopted to eliminate solids; the most perfect design of oxidising filters may be rendered abortive if the sewage is not suitably prepared before it is applied to the surface of the medium.

The evolution of the Emscher tank has given a fillip to the consideration of the sludge question which will bring us nearer the solution of the sludge problem. Care should be taken, however, not to clothe the tank with virtues which it does not pretend to possess. It has been designed to retain and digest solids, and render them at once inoffensive and capable of being readily dried at moderate cost, and I can bear testimony to its ability to do all this, but it does not follow that the Emscher tank will be a suitable medium for [illegible] sewage for the bacteria bed. It does not take the place of the settling tank, whose function is to equalise the quality of sewage arriving at the outfall works, nor does it pretend to eliminate colloidal or ferruginous matter, which, if run on to a filter in excessive quantity, would certainly impair its usefulness. The tank, however, has succeeded in keeping sewage from fermenting when that course is desirable, while the solid organic matter is at the same time resolved by the septic process into an inodorous and easily dried substance, incapable of giving rise to nuisance. I tried hard to make this [illegible] in 1901, but failed, after an effort extending over the whole year.

In a paper read in 1903 at the annual conference of the Institution of Municipal and County Engineers, I stated that the irreducible residuum of the septic process was an [illegible] which had been used at Birmingham since 1903 to fill up land depressions in the neighbourhood of the septic tanks. Thanks to the excellent work of Dr. Travis and Dr. Lovett, this work has been still further developed.

When the sewage has been properly prepared by settlement, chemical precipitation, septic action, or a combination of them all, it should be exposed to the action of the friendly microbe, and if that action is sufficiently prolonged, the constituent matters of the sewage, such as albumen, are practically destroyed, or more correctly converted into carbonic acid, free ammonia and nitrates. When everything is taken into account, I believe it will be found that this can be best done on what are termed percolating filters, but contact beds are also capable of doing somewhat similar work, and if the production of a consistently good effluent were the only desideratum, land irrigation, and intermittent filtration, which is a form of the same thing, are capable of doing even better work.

One of the reasons assigned for the appointment of the Iddesleigh Commission in 1898 was the difficulty of obtaining suitable land in England for sewage purification. As everyone knows, the interim report issued by the commission in 1903 stated that it is practicable to produce by artificial processes alone effluents which will not putrefy, and may be discharged into a stream without creating a nuisance.

At no time has the efficiency of good land as a vehicle for sewage purification been impugned. When land has been found to be unsuitable in quality, inadequate in area, or too dear in price, it has been condemned. A notable instance of this is to be found at Birmingham, where the District Drainage Board acquired 5 or 6 miles of the valley of the Tame at a cost of £400,000. Much of this land was unsuitable in quality, and the constant increase of population rendered it necessary to adopt other methods of purification; but, so far, this is the only example of a great sewage farm having been abandoned in favour of a biological purification plant. There appears to be a prospect of Paris following the same course. A paragraph on p. 92, Vol. 2, of the report of Dr. Calmette and four colleagues to the Minister of Public Instruction, after describing what Birmingham has done, says: "This is exactly the solution which we are convinced will be forced on the city of Paris."

PERCOLATING FILTERS *v.* CONTACT BEDS.

Some years ago a well-known English expert, in speaking of the relative merits of percolation and contact beds, stated that contact beds were dead. His remark was somewhat premature, as Sheffield has since laid down 40 acres of those beds; at the same time he voiced an opinion which is being strengthened daily, and it may now be assumed that percolation beds are being constructed in England in preference to contact beds wherever the conditions are suitable. A notable case to the contrary is Oldbury, where, after a series of experiments extending over a considerable time, Prof. Frankland and Mr. Silvester came to the conclusion that triple contact beds were more suitable than percolating beds for the purification of a sewage containing large quantities of acid, of which sulphocyanide formed a prominent feature.

In their Fifth Report the Royal Commission state that, taking into account the gradual loss of capacity of contact beds, a cubic yard of material arranged in the form of a percolating filter will generally treat satisfactorily nearly twice as much tank liquor as a cubic yard of material in a contact bed. Percolation filters are better adapted to variations of flow than contact beds. The effluents from them are usually much better aërated than the effluents from contact beds, and, apart from suspended solids, are of a more uniform character. The risk of nuisance from smell is greater from percolating beds than from contact beds. The commission also found that with percolating filters there is nuisance from flies.

No one has attempted to upset the decision of the commission, and where contact beds are adopted in future there will probably be found to exist special local and physical reasons for their preference.

The cardinal principle which has always influenced me in preferring percolation beds to contact beds is the belief that the oxidising process is dependent upon the free admission of air into the heart of a

bed. It is obvious that the air supplied to this form of purifying agency is restricted to the volume of sewage treated, whereas it may be equal to many times that volume in a well-constructed percolation filter.

That we have succeeded in constructing the best possible filter should not be taken for granted lest progress be unduly fettered, but whatever advance the future may bring with it, the percolation bed as we now know it is not likely to be improved out of recognition.

FILTER CONSTRUCTION AT BIRMINGHAM.

A brief description of the percolating filter most recently constructed on the Birmingham works may be taken as an indication of what I consider an oxidising bed should be for the treatment of strong sewage. The filter area referred to is 6·6 acres, and is nearly equally divided into two portions. The floor is laid with concrete, 4 in. thick, on a foundation inclined at a gradient of 1 in 100 towards the effluent channels. The concrete floor is covered with semi-circular aërating tiles. These are carried through the enclosing walls, so that the air may pass without hindrance from side to side of the bed. The enclosing walls are 5 ft. in height, and are built of rubble stone (Croft granite), laid without mortar. The thickness of the base is 2-ft. 6-in. battering, 5 to 1 on the outside face, and where the walls are built transversely to the line of aërating tiles, the latter are carefully bedded and levelled on top with cement mortar to form a foundation for the walls. The top course is levelled up with stone bedded in cement mortar. The medium, which has an effective depth of 6 ft., consists of hard stone or ball slag of best quality, broken as uniformly as possible to pass a 2-in. ring, and be rejected by a 1-in. ring. The main supply pipe, 21 in. in diameter, is laid alongside the eastern walls of the block, from which branch pipes, 10 in. in diameter, are led to the beds and extended on the opposite side, where they are connected up to the washout pipe. These branch pipes are laid across the beds in parallel lines, and at right angles to them 3-in. distributing pipes are laid, in which spray jets are inserted. The pipes are made of cast-iron, and weight 6½ lb. per foot; the thickness is not more than $\frac{5}{8}$ in. since the maximum head is only 10 ft. or 12 ft. They are laid on the bacteria bed without special support, but Jones's expansion joints have been employed to couple them together.

The actual cost of constructing Block D, exclusive of any work or plant connected with the supply to the walls was £39,555. On a net area of 6·6 acres this is equivalent to £4,620 per acre.

The filters first constructed at Birmingham cost £5,900 per acre, owing chiefly to the smallness of the unit area; as, however, each advance in size gave an equally well oxidised effluent at less cost, the area has increased with the construction of each block of beds, and the latest now under construction is 7 acres. Engineering and economic questions alone should determine the unit area.

FILTERING MEDIA.

Purification depends on various factors, but mainly upon the extent of bacterial surface—as Mr. Rudolph Hering has called it—over which the tank liquor is made to trickle, and the time it occupies in percolating from top to bottom. The question of the size of medium and depth of bed must have a direct bearing upon the volume and strength of liquor to be oxidised.

Theoretically, a fine medium should be preferred to a coarser one. Dr. Reid has studied the virtues of small medium, and as the result of his study and experience has consistently advocated its use. He can point to Hanley and other places where fine medium is used successfully; he can show that there is eight times the bacterial surface available for purification in ¼-in. cubes as compared with 2-in. cubes, and he can show consistently good effluents from fine grain shallow filters. The Dorking experiments confirmed the main points of Dr. Reid's contention. At Birmingham and other places medium of a large size, approximating to 2-in cubes, is used.

Since it is admitted that with fine grain medium less depth is required, and a more brillant effluent obtained, the question naturally arises, Why not adopt fine medium? Chiefly because large medium of greater depth to do the same work is not more costly, and it provides greater security against pooling and clogging.

DESIGN OF WORKS.

In large manufacturing districts sewage varies in composition, and an engineer in designing a purification plant should see that it is capable of giving that elasticity which is invariably demanded from purication plants in exceptional weather, and when unexpected rushes of trade waste arrive at the works.

The designer of oxidising beds should not rely upon the infallibility of preliminary tank processes to free the filters of all unnecessary work. Mistakes take place in management, the composition of the sewage may permanently alter, and the colloids permanently increase, as at Manchester, where the albuminoid ammonia figure has in recent years gone up nearly 100 per cent. A town's manufactures may change entirely, as at Coventry, where silks and watches have given place to the motor industry. Aëration is often impaired by unfavourable climatic conditions; for instance, at Birmingham, where unsepticised sewage was applied to the bacteria beds, in cold weather it was found that the surface rapidly became "mackintoshed" over with a thick gelatinous fungoid growth. No doubt this is a condition capable of prevention, but the designer of the works may have no control over the management, and should see that a sufficient margin of safety is secured by constructing a filter which readily recuperates; otherwise the design is unjustly blamed.

Anxiety on the part of the public bodies to keep down initial expense in constructing bacteria beds should be met firmly, and if possible with figures to prove that cheap beds are not profitable. A medical friend, who holds a distinguished public position, once complimented me on the appearance of the massive masonry walls round the Minworth bacteria beds, but proceeded to question whether the expense was justifiable, and added that medium should be allowed to slope on a natural angle from the top of the bed. He was astonished when I gave him figures to show that his untidy method would cost double what the massive walls had cost. Later, he suggested that the nitrifying organism would do as good work on a heap of unscreened clinker as on a well prepared oxidising bed, and he pointed to a case where beds had cost less than £2,000 per acre. I told him that I had constructed several acres of beds in this way at a cost of only £800 per acre. I was not able then, but I can now give the cost of treating 1,000,000 gallons of sewage on those "cheap" beds, compared with the cost of treatment on the beds already described:—

—	Slag and coarse medium.	Furnace ashes.
Volume to be treated	1,741	308
Capital cost per acre	*£7,100	£800
Interest on capital cost at 3½ per cent. per annum	£1 16s. 5d.	1s. 1½d.
Working cost per 1,000,000 gallons	9s. 1d.	9s. 9d.
Total cost per million gallons	£1 11s. 7d.	£1 8s. 8d.

* This figure includes a proportion of the cost of supply and effluent channels, storage separating tanks, carriage, wharf, &c.

The initial cost of the "dumped" furnace-ashed bed, it will be observed, is low, and the maintenance charges high as compared with the carefully constructed stone and slag bed.

The furnace ashes bed—as might be expected from 6 ft. of fine medium—produced a very good effluent, but the surface, being dosed with strong Birmingham sewage, clogs readily. Washing and replacing are not attempted, as this work would amount to 1s. 6d. per yard, or much more than new material would cost. Periodical scraping and removing the top layer is found to be sufficient.

It is urged against large medium that another process is necessary to separate the humus from the filtrate before it is fit to enter a river, but as this can be done in separating tanks for 2s. per 1,000,000 gallons, the objection is of comparatively small moment. A fine medium bed has advantages where a brilliant effluent is a desideratum, where it would be difficult to get rid of humus from the filtrate, where a high cost for maintenance is not prohibitive, and where a temporary stoppage of the whole plant would not be a very serious matter, but it not suitable for installations of any magnitude.

DISTRIBUTION.

Unless where the upper layers of a percolating bed consists of very fine medium, as in Dr. Dunbar's filter at Harzburg, the sewage in its passage through a healthy bed passes through the bottom immediately under where it drops upon the surface. The establishment of this fact emphasises the desirability of

feeding a percolating bed in such a way that each particle of material receives an equal quantity of liquor.

Engineers have had varying success in their efforts to design appliances capable of fulfilling this important condition. Some excellent devices have been brought to the notice of the public by their makers, and a good deal might be said in favour of each, but the best are costly, and the worst are cheap only in name. It may be assumed that moving distributors are all liable to be prejudicially affected by wind, frost and snow, unless when they are power driven, in which case they are more costly. On the other hand, wind, as it influences the spray jet—and it is rarely perfectly calm in this changeable climate of ours—tends to equalise the distribution when this type is used.

Absolute uniformity of distribution there cannot well be. Even the Scott-Moncrieff distributor, the most uniform distributor I have known, which rotated round Bed C at Minworth with all the regularity that an electric drive could give, dropping as it travelled sewage so equal in volume that test trays 12in. square, placed close together in a straight line, from centre to circumference, resulted in collecting the same quantity in each tray, was no exception to this rule. Now compare the results of six months' working of this distributor with similar work by spray jets on adjacent beds dealing with the same tank liquor, and after both beds had been at work for about two years:—

—	Scott Moncrieff distributor.	Spray jets.
Volume treated during six months	29,500,000 galls.	72,000,000 galls
Rate per square yard per day while working	154·6 galls.	169·3 galls.
Capital cost of beds per acre, including all subsidiary works...	£11,148	£7,170
Interest on capital cost per 1,000,000 gallons	£2 6s. 10d.	£1 4s. 7d.
Working cost per 1,000,000 gallons	12s. 2d.	12s. 10d.
Total cost per 1,000,000 gallons	£2 19s.	£1 17s. 5d.
	Parts per 100,000.	
Oxygen absorbed in four hours (filtrate)	2·784	3·018
Ditto (separating tank effluent)	2·041	—
Percentage of purification (filtrate)	84·3	83·0
Ditto (separating tank effluent)	88·5	—
Albuminoid ammonia (filtrate)	·274	·370
Ditto (separating tank effluent)	·239	—
Percentage of purification (filtrate) ..	73·6	71·1
Ditto (separating tank effluent)	81·4	—
Nitrates and nitrites as nitrogen	2·208	2·0·9
Suspended solids (filtrate) ..	4·9	8·8
Ditto (separating tank effluent)	1·7	—

When it is borne in mind that the Scott-Moncrieff distributor rotated on a bed 7 ft. deep, and the spray jets were fixed on a bed only 6 ft. deep, the resultant effluents do not appear to justify the conclusion that the one is much better than the other.

My contention is that the total effluent must necessarily be compounded of volumes which have undergone varying degrees of purification on different parts of a filter. If for mechanical or meteorological reasons the spray is not distributed uniformly certain portions of the filter get more work to do than others, but this is got over to a large extent by changing the position of the jets periodically, and, of course, change in the direction of the wind constantly brings about minor changes automatically, which tend to even up the distribution. So long as these conditions obtain, and waterlogging is avoided, the practical result is not unsatisfactory. Nor should it be forgotten that even although the intermittency is irregular, that part of the bed which for the time receives no sewage may be recuperating and adjusting itself to bear a strain later on. Assuming for a moment the worst possible case, namely, that a certain portion of the filter never received any sewage—the effect would be that a larger volume of filtering material would be required to achieve the same result, and thus the true engineering aspect of the matter appeared—namely, the question whether it was better economically to spend money on extra filtering material or on extravagant methods of obtaining ideal distribution. This could be decided only by considering the total resulting purification of a given volume of sewage, in terms of the total cost of obtaining it, and not merely the cost of the distributing mechanism.

All forms of distribution on percolating filters are liable to give rise to nuisance from smell, if a strongly smelling liquor has to be dealt with. In the case of trays or tipping troughs, the smell is confined more or less to the immediate vicinity of the filter, and it may be largely done away with at small works by providing an inexpensive form of cover for the filter. The spray jet has been held to be the most liable to give rise to smell, but moving sprinklers are almost equally bad in this respect. This is bound to be more apparent during periods of prolonged heat, but the application of hypochlorite of sodium, as used at Ostend in Belgium, or hypochlorite of calcium, as used at Birmingham, Hanley, Burslem and Stratford-upon-Avon, although costly, is fairly effective when mixed with the tank liquor before its application to the oxidising filters. Care should be taken not to apply as much as will inhibit the life of the nitrifying organisms, or produce injury to the river into which the effluent enters. If it is applied before septic action is too far advanced, 1 part per 100,000 will probably be found to be sufficient, and this quantity will be more than enough to keep down the fly nuisance.

MANAGEMENT.

One word with regard to management. However well a plant may be designed, if it is not well and skilfully managed it will become a nuisance, and bring discredit on the engineer who designed it. The disposal of the liquid filth of a great community has an enormous potentiality for evil, and if a town authority believes it necessary to avert this by expending large sums of money on constructional work, it is their bounden duty to see that the plant is placed in the most competent hands. Local authorities are by no means sufficiently alive to this aspect of the question, with the result that too many works are left to the management of untrained men. Hitherto anybody has been deemed good enough to look after a sewage works, but the day has now come when the manager should be a highly trained technical expert, if a local authority hope to get full value out of the sensitive entity which we call a bacteria bed.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTHERN DISTRICT MEETING AT NEWCASTLE-ON-TYNE.

At a meeting of the northern district of the Institution of Municipal Engineers held in the Town Hall, Newcastle-on-Tyne, on September 21st, there were present Messrs. John Davison (in the chair), John W. Holbrook (Houghton-le-Spring), W. R. Plews (Sedgefield), W. B. Thomas (Southwick-on-Wear), Lionel Simpson (Barnard Castle), H. A. Strong (Gateshead), Geo. Gregson (Durham), Wm. Robson (Leadgate), H. G. Haines (Durham), R. E. Riddle (Bellingham), W. J. Coulson (Cramlington), J. W. Moncur (Sunderland), C. W. Hall (Felling) and John Robinson, hon. district secretary.

Mr. J. W. Moncur thanked the members for electing him chairman for the ensuing year.

The secretary introduced the question of securing grants from the Road Board for secondary or district roads, and explained the position in the county of Durham, at the same time pointing out that the probability of any council obtaining a grant for district roads was very remote unless councils and their surveyors protested very strongly against the Road Board allowing the county council to have entire control of monies allotted to that county. It was decided to take the application for a grant for Morton Palmsroad in the Darlington Rural District as a test case, and members present pledged themselves to see the county representatives representing their various districts before the county council meeting to be held in October, and endeavour to persuade them to vote in favour of giving a grant to this particular road.

It was agreed to hold a joint meeting with the Yorkshire division at Harrogate on October 19th.

A vote of thanks was passed to the Lord Mayor for the use of the committee room for the meeting.

Lower Thames Valley District Surveyors' Association.—The annual meeting of the above association, the president of which is Mr. E. Willis, Assoc.M.Inst.C.E., F.S.I., will be held at the Town Hall, Twickenham, to-morrow, the 5th inst., at 6.30 p.m., when the appointment of officers for the ensuing year will take place. In addition to this, the programme for the coming session will be discussed, and it is expected that a large number of useful and interesting papers will be read during this session. It is hoped that every member will make a special effort to attend.

CREOSOTED WOOD PAVING.*

By H. T. WAKELAM, M.INST.C.E.,
County Engineer of Middlesex.

Many experiments with bituminous and other materials have been and are being carried out, but up to the present time I have not seen anything that will satisfactorily sustain the heavy traffic of Middlesex at a resultant cost less than creosoted wood paving. I mean by this that if (as it is hoped will be the case) the Local Government Board from now onwards grant loans for the periods of ten years for creosoted deal blocks, and twenty years for the concrete beds, the annual repayments of principal and interest on the loans will be found in the end to be less than the cost to be incurred (at present prices) in connection with any bituminous material at present on the market—*i.e.*, when the life and cost of the latter is considered. These remarks, as I have pointed out, apply to roads which carry a heavy traffic.

Several lengths of creosoted deal paving which have been laid for periods extending from fourteen to eighteen years are now being relaid in Middlesex. This proves my point, and, in my opinion, it is difficult to find a material which will give the same benefits, from a financial point of view, as creosoted wood blocks give, where traffic is fairly heavy, unless sett paving, or possibly "Durax" paving, on concrete be adopted.

The following figures are applicable to loans raised on an assumed quantity of wood paving:—

	£ s. d.	£ s. d.
Area (say), 5,000 sq. yds.		
Cost, 11s. 9d. per superficial yard		
Wood, at 7s. 6d.	1,875 0 0	
Concrete, at 4s. 3d.	1,062 10 0	
		2,937 10 0
Half-yearly instalments on loan:—		
Wood, 10 years at £, per cent per annum	113 5 9	
Concrete, 20 years at £, per cent per annum	37 7 0	
		150 12 9
Annual repayment for wood 10 yrs.		226 11 6
" " concrete (20 yrs.)		74 14 0
Total repayment for wood	2,265 15 0	
" " concrete	1,494 0 0	
Total repayments for wood and concrete		3,759 15 0
	s. d.	s. d.
Cost per super. yard for wood (including interest) for period of loan (10 years)	9 0·756	
Cost per super. yard for concrete (including interest) for period of loan (20 years)	5 11·712	
Total cost of wood and concrete (including interest)		15 0·468
	d.	s. d.
Cost per super. yard per annum, for wood for period of loan	10·875	
Cost per super. yard per annum for concrete for period of loan	5·585	
Total cost of wood and concrete per square yard per annum for 10 years		1 2·460
		d.
Cost per super. yard per annum for wood for 14 yrs.		7·768
Add concrete		5·585
Add maintenance		2·500
Total cost per yard per annum for 14 years (including repayments of principal and interest)		13·854
	s. d.	
Cost of relay of wood (including interest) for second period of 14 years	9 0·756	
Balance of cost of concrete, 6 years at 5·585d. per yard per annum	1 9·510	
Total cost of relay (including interest)	10 10·266	
		d.
Cost per super. yard per annum for wood for 14 yrs.		7·768
Add concrete		1·536
Add maintenance		2·500
Total cost per yard per annum for second period of 14 years (including repayments of principal and interest		11·804

As compared with the above figures, a leading company undertake to lay and maintain macadam roads of a bituminous nature, for a period of five years, at a cost of 7s. per sq. yd. At this rate a fifteen years' life will cost 21s., equal to 1s. 4d. per sq. yd., as against 1s. 1½d. for creosoted wood paving for a fourteen years' period. These are actual results from present prices, and from which it will be seen that wood paving is the cheaper material over a given period.

The advantages of expedition in repair, and non-disturbances of surface (from a relay point of view) during long periods are well known in connection with creosoted wood paving.

The same consideration in regard to cost applies also, in a degree, to roads carrying a light traffic, and it is probably only the wealthier districts that can provide roads of a bituminous nature and afford the luxury of smooth surfaces on district roads at an enhanced cost. It is furthest from my wish that I should be misunderstood in the matter, or that I have any desire to decry a provision of roads with smooth, superfine surfaces, even at an increased cost. I only wish to present in these notes the commercial aspect of road upkeep.

Until I have more information before me, I personally am not disposed to advise any large expenditures or contributions in connection with bituminous coverings. . . .

What is badly wanted at the present time is something that will come (with a life commensurate with its cost) between an ordinary water-bound basaltic or granite road (tarpainted each year) and creosoted deal paving. I believe it will be found as time goes on that the something will be in the nature of asphalt, or an asphaltic material. If I am right, and it should be so, the damage from motor and other mechanical traffic, which is increasing so rapidly in Middlesex, should be to a great extent relieved.

* Extracts from Annual Report.

THE DUSSELDORF EXHIBITION OF CITY BUILDING.

We have already drawn attention to this exhibition (THE SURVEYOR, September 27th, p. 437), which remains open until October 31st, but, in view of its exceptional interest, add some supplementary details.

There are, it may be stated, about 600 exhibitors, showing nearly 4,000 different objects, grouped under City Building, Sanitary Arrangements, Hospital Management, Civil Engineering, and Industry. The department of City Building presents in thirty-seven rooms a number of solutions of town-planning problems, one scheme of universal interest showing the contemplated construction of a network of roads, 69 ft. in minimum width, to afford a connection as straight as possible between the various centres of industry, and to deal with street, tram, as well as carriage traffic.

An important department, coming under the head of "Sanitary Arrangements," is that of drainage plants and the purification of sewage. Included are all the different systems of drainage—plants for the mixing and separating systems, mechanical cleaning and settling tanks, as well as plants of the biological and oxidation processes, special plants of the Emscher-Brunner system, and minor settling plants for industrial works, hospitals, and the like.

The kindred problem of street cleansing and refuse disposal is most adequately illustrated. The city of Dortmund, for instance, shows an installation for the collection of domestic refuse destined to be transported to some distance, and for the cleaning of dustbins on the alternating system. A large-scale refuse-sorting plant connected with agricultural operation is exhibited by a refuse utilisation company. Pictures and actual models of refuse destructor plants are shown by some of the most important cities of Western Germany, and by many engineering firms.

Communal and private hygiene—inclusive of the installation of baths, sanitary plants, heating, disinfection, school hygiene, and other sanitary arrangements—constitute another department. Maps, illustrations, and models of widely different bathing establishments—from the simple douche to the large swimming tanks—and the most modern achievement—viz., riverside "beaches"—are among the more important exhibits of this part of the exhibition. Other displays of interest are those relating to the destruction of rats and gnats, and, on the other hand, to the protection of animals. The various arrangements for the treatment and prevention of disease form a special group, showing in a most comprehensive manner the management of modern hospitals, as well as the provision made for the prevention of epidemics and the protection of infants.

The department of Civil Engineering comprises plans and models of public and industrial buildings, railways, and bridges.

Gift of a Town Hall. A town hall and municipal buildings, erected and completely equipped, at a cost of £5,000, were presented to the town of Mold, North Wales, on Tuesday, by Mr. Peter E. Roberts, J.P., chairman of the Mold District Council, who is a native of the town.

CORRESPONDENCE.

[illegible]

TOWN PLANNING: WHOSE WORK?

To the Editor of THE SURVEYOR.

SIR,—Mr. Culpin's letter in a recent issue of your paper, offering to supply lecturers on behalf of the Garden Cities and Town Planning Association, prompts me to ask if you will open a discussion as to whose work town planning really is.

Are Mr. Culpin's lecturers architects, or are they municipal engineers?

If the latter, surely, before going into the district of another municipal engineer, they will wait for his personal invitation. If the former, as I suspect, I contend that the planning of a new town, a thing rarely called for in Britain, or the much more frequently required planning of extensions to an existing town, is essentially the work of a municipal engineer.

The more this is made public, the greater the justice to municipal engineers; for nowadays one frequently hears young architects and estate agents talking glibly of the town planning schemes they have in hand, or have carried out, and so claiming to be authorities on civic design. As a fact, the work they talk so much about is, as a general rule, building estate development, or, at most, suburb design on rural lines.

This is best exemplified by thinking of what the designer of mere town extensions has to do.

His first work is to choose an attractive area, and to ensure the town shall grow within it, and not "leak" outside. Mr. Carnegie told me the other day that this had been the great difficulty in America.

In Britain he must then bring the ordnance survey up to date, and set about what is by far his most tedious task—the altitude survey. Let me say at once that such methods as those of the barometer are useless for this survey. Next he has to plan his water supply and his sewerage system; and in connection with these matters, unless he be familiar with the work of such men as Dr. Hagen and Prof. Bechmann, his schemes are likely to be about as uneconomical as those in general vogue. How many architects have studied the works of these men?

In looking into the great question of communication, he comes into contact with not only such problems as modern road construction, but he is immediately faced with tramways, light railways, and sometimes jetties and even harbours.

In many cases he will desire to open up inexpensive "back" land, which will entail the construction of bridges across railways, canals and rivers; yet how many architects have made a study of economical bridge design?

Right at the outset he will be plunged into the most delicate, but none the less delightful, negotiations with landowners, railway companies, and such, for he will have the handling of huge interests; when approaching people for the first time he will be highly amused to find they expected in him a kind of park architect or landscape gardener, a kind of a "je ne sais quoi"; something they like to call a town planning expert: while the height of his ambition is to be a plain engineer. I give the above to prove how well certain schools have propounded their theories.

The leitmotiv of all his work, nay, his one object, must, of course, be to produce a beautiful, convenient and healthy place to live and work in; but I contend the municipal engineer has as much right to be [illegible] the average designer of suburban villas.

[illegible] I bear the architect not the slightest ill-will; on the contrary, I hold [illegible] I [illegible] that the latter has a living [illegible] the average [illegible] and little [illegible] and professional, to prove that he is worthy of it, except as a mere servant. That good engineer [illegible] Mr. [illegible] Britain, that he found our architects showed greater intelligence in the subject than did our engineers. [illegible] architect for Mr. John Burns' sagacious Act.

What I claim is that the British architect's true [illegible] type has done for Düsseldorf, and to concede to the municipal engineer his true work of town planning, construction and maintenance. Incidentally, I should like to see the latter individual try to rise a little more to his present opportunity.—Yours, &c.,

J. E. WILKES

Borehaven.
September 25, 1912.

THE CROMPTON PAVEMENT.

To the Editor of THE SURVEYOR.

SIR,—It is not a little curious that your current issue should contain references to Colonel Crompton's "new invention," and also to a pavement made in Germany called "Terbacca," and that their prominent features bear such a remarkable resemblance to each other that it is not easy to distinguish between the two, even when they are placed side by side.

TERBACCA.	CROMPTON PAVEMENT.
"Used in Germany for the past two or three years." (*Vide* THE SURVEYOR, September 27, 1912, p. 415.)	"The invention of Colonel Crompton." (*Vide* THE SURVEYOR, September 27, 1912, pp. 410, 426.)
Materials. 90 volumes of stone in three different sizes. 10 volumes of sand.	*Materials.* Graded granite. Sand.
Binding ingredients. 40 to 60 volumes of cement. 5 volumes of tar, thinned with solvent.	*Binding ingredients.* Cement. Bitumen
How prepared. Matrix and cement mixed together dry, then 10 per cent of water added, together with the liquefied tar.	*How prepared.* Heated and mixed to (say) a temperature of 600 degrees.
How laid. On an underlayer of beton 5 in. thick the mixture is spread much thicker than required finally, then tamped down with a 6-lb. rammer to a finished thickness of 2 in. or 3 in.	*How laid.* A sublayer of material 2½ in. thick and a wearing carpet of smaller material 1 in. thick, making a total thickness of 3½ in.

To want to probe into their relationship, and especially to rush to find out whether this is closer than "cousin German," is perhaps not altogether polite, but I may refer to their constitution and characteristics.

I must say I like the frank, open expression on the face of "Terbacca." This forms such a valuable factor in estimating its true character, and whether it is likely to have a successful and long life or not.

The character of "the new boy" cannot be as easily judged because no light is shown on part of its features, and we are not able to see what form and proportion the graded granite is in, or the quantities of sand, cement, and bitumen, nor the exact composition of the latter.

By the way, is it a good thing to mix "bitumen" and cement? To me it seems unnatural and unwise to blend black bitumen with white cement; does it not detract from the strength and spirit of the latter? I must confess I prefer it mixed with water and uncontaminated by any tarry compound. I have never been able to bring myself to believe that they go well together. I wonder what additional strength the new baby is supposed to derive from this mixture.

Then as to the heating to 600 deg., must this be so exact? Would the baby's complexion be endangered by any variation from this particular figure?

As I read it, this heating is applied after all the ingredients have been mixed together; what advantage is gained by this over the usual process of heating the aggregate only? Does the bitumen not try to run away from this "hot stuff," or is it held fast by the cement?

Then as regards the laying. Is the sublayer 2½ in. thick prior to or after consolidation, and of what gauges is the granite graded to? Similar queries apply to the carpeting and what mode of consolidation is employed. Is the carpeting "squeezed out from between rollers and spread like from a paper machine," as described in the preliminary announcement of the birth of this "new invention" (*vide* THE SURVEYOR, October 6th, 1911)?

Then as to the cost. I see this is now stated at "about 4s. 6d. per square yard," which shows that the new baby is "just a little dear." A year ago we were led to believe that the price would be 2s. a yard. Does the 100 per cent. increase represent the premium for insuring it for five years? A year ago it was estimated that its life would extend to ten or fourteen years. Is it now found not to have quite as strong a constitution as was anticipated? Or perhaps its sponsors now realise that it will have a bad time it

that "horrid creature" Mr. Torbus comes across it.—Yours, &c.

W. J. Howard Smith.

Westminster.
October 1, 1912.

P.S.—I saw that another doughty colonel—Bingham by name (you will "knaaw that maan, he cooms fra' Sheffield")—has been rating the Holborn Borough Council and its surveyor upon their ignorance in road-making matters.

Remembering that Colonel Bingham had himself invented a new type of road surface, I looked up my notes about it to see what his ideal paving was like. Here is its official description:—

"Pavements constructed according to this invention may be made of ordinary granite or stone setts or bricks put loosely in position, and blocks of hard wood, preferably about 1 in. or 1½ in. in thickness, are driven in between each stone, so that each sett is surrounded with hard wood tightly compressed and left with an elevation as may be found most convenient in height above the level of the stone blocks.

"Where a granite pavement is already laid down and it is not considered advisable to relay the same, it may under this invention be converted or rendered safe and noiseless by the insertion of wood wedges or pep between the granite setts.

"It may be necessary to do this to chip away the corners of the setts and to make holes at intervals round each sett, so that wood pep may be driven in."

I will content myself by adding that we should, at any rate, soon get to know something about "corrugation" if we had our pavements made according to Colonel Bingham's invention.

W. J. H. S.

THE VENTILATION OF SEWERS.

To the Editor of The Surveyor.

Sir,—Will the problem of sewer ventilation never be solved?

No one can read the paper presented by Mr. De Courcy Meade at the Berlin Congress, and reproduced in your last issue, without being struck with the apparent impotence of engineers to find a satisfactory solution of that question which has vexed the profession for the past half century.

The paper informs us that the Corporation of Manchester undertook a somewhat exhaustive investigation of the subject by three gentlemen eminent in their respective professions of public health, chemistry and engineering, that schemes for ventilating the sewers in the city were invited by public advertisement, and that out of twenty schemes submitted in response to the invitation, only four appeared worth consideration or, at any rate, worth the cost of the investigation.

Of these four the tests of three are described in detail, giving the results and the cost thereof.

The weak features of the several schemes are accordingly disclosed, and it is pretty clear that it would demand a generous stretch of imagination to consider any of them an unqualified success.

The honour of a detailed account of the test was, however, not done to the fourth system mentioned in the paper as "Method D." All that is said about it is that "the results of the tests would not warrant the general application of the system."

The invention of that method claimed that it prevented the disturbing action of the wind within the sewer," which, be submitted, and which is now generally accepted, was the chief cause of the emission of foul odours from the sewer openings; that it permitted the sewer to expire and inspire by natural ventilation just as the exigencies of variations in the volume of liquid in the sewer, atmospheric changes, or other phenomena rendered necessary, and that it did so to an extent which prevented any appreciable use of pressure within the sewer on the one hand, and any outward rapid rush of air at any particular spot giving rise to foul odours in the other. This was accomplished by permitting it to "breathe," not through open mouths, but, as all medical men advise, through the nose—that is, through a passage provided with a check constituting an air filtering arrangement.

What it would be interesting to the profession to know with respect to method D is, what kind of test was applied to it at Manchester; whether it did or did not verify the inventor's claim; if not, in what respect the system failed; why it should not warrant general application, and to what extent its application was warranted by the investigation.

This information would at least carry the question further than it seems to have advanced at present, if only it pointed out what should be avoided.—Yours, &c.,

T. Caink.

Worcester.
October 1, 1912.

IS THE ROAD BOARD A FAILURE?

To the Editor of The Surveyor.

Sir,—Referring to the correspondence in your paper as to the lines adopted by the Road Board in the allocation of their grants, I think most surveyors who have had interviews with them will agree that they have worked hard and done their best to meet the demands made on them, but opinion will probably differ as to whether they are on the right lines.

Many highway authorities have been disappointed to find that in almost every case a grant from the Road Board has involved an extra expenditure out of their own pocket, and it has always appeared to me that the board, in their anxiety not to relieve highway authorities of any of the ordinary expenditure which they had to incur prior to the constitution of the board, have failed to recognise that this, so-called, ordinary expenditure has increased by leaps and bounds during the last few years, owing to the ever-growing mechanical traction.

This increasing expenditure began to be felt just before the constitution of the Road Board, and no doubt many surveyors urged their councils not to let their roads go back, but to meet the extra cost, pointing out that there was talk of an increased tax on motors and a new tax on petrol, which would probably be devoted towards this cost, and when the Bill was in Parliament I think it was generally thought that this would be the case.

If grants could be made towards this extra cost, which has been almost entirely caused by the mechanical traction, it would do away with the complaint of the ordinary ratepayer that he is being called upon for a bigger expenditure on the highways in his district to meet the wear and tear of motors, from which he derives no benefit, but rather the reverse in the shape of "nuisance from dust," &c.

Again, the method of calculation on the basis of the population of an area is not to be commended. It may frequently happen that a sparsely populated district has a long length of trunk main road to keep up, which is largely used by motorists passing straight through, and from whom they derive no benefit, and yet only receive a very small grant based on their population, while a thickly populated district, and consequently probably richer, with only a short length of trunk road, gets a bigger grant.

I venture to suggest that if grants could be made on these lines, and based more on the amount of foreign traffic the roads have to bear in lieu of a population, it would be more popular.—Yours, &c.,

W. B Purser.

County Surveyor's Office,
Grantham.
October 1, 1912.

To the Editor of The Surveyor.

Sir,—I am sorry if, as you say I misinterpreted the invitation contained in your article on the above subject, but in view of your remarks I trust you will allow me to explain that I did not intend to suggest that any one was intentionally acting unfairly. At the same time the fact remains that if any certain class of material is specified for any particular work then all other similar materials are placed at a disadvantage. My point is that unless an article is proved to be altogether superior and to possess indisputable advantages over other similar goods, then it should not be specified.

As with certain materials it requires considerable experience to be able to decide which one of many is suitable for any particular purpose, it is very easy therefore for an error of judgment to be made, and as the material referred to in my previous letter has no particular advantage I submit that it is wrong practically to put all others—including several articles whose superiority has been proved—out of court.

For any one to claim to be able to say after a short experience only what, for instance, is the most suitable bitumen for any named purpose, is as humorous as it is dangerous.—Yours, &c.,

Practical.

October 2nd, 1912.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for September is divided between

Mr. J. W. Smith,
47 Eccles-road,
Clapham Junction.

and

Mr. F. E. Yewdall,
Town Hall,
Richmond, Surrey,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

275. Cantilever.—A cantilever of uniform cross-section and length L carries a concentrated load W at the free end. A prop is placed at a point $\frac{L}{4}$ from the free end, bringing this point to the same level as the fixed end. Find an expression for the reaction at the prop, and the deflection of the free end of the cantilever. Neglect the weight of the cantilever. (B.Sc.Eng. Final.) (H. F. W., *Tottenham.*)

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

277. Sewage Disposal.—What main principles should be kept in mind in arranging the sewage disposal of the following: (*a*) A village of 800 inhabitants (purely agricultural)? (*b*) A town of 2,000 inhabitants (industrial)? (*c*) An infectious diseases hospital of 100 beds? ("Charger.")

REPLIES TO QUESTIONS.

273. Cast-Iron Stanchion.—Calculate the size of a cast-iron stanchion 12 ft. in height alongside an external or party wall to carry a load of 54 tons. (T. R.)

The most economical and best practical form of cast-iron stanchion is that shown in Fig. 1. Cast-iron is a very treacherous material on account of flaws which may exist, and which are difficult to detect, and internal stresses which may be set up by irregular cooling. These internal stresses render the casting liable to fracture when subjected to shocks or sudden changes of temperature, such as may occur during a fire. The section selected is to enable the whole of the surface to be closely inspected, and thus a much lower factor of safety is allowable than with hollow circular columns, which cannot be well inspected.

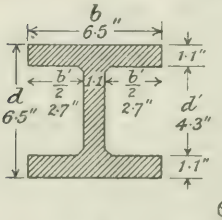


Fig. 1.

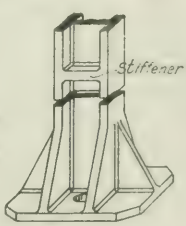

Fig. 2.

A convenient, and probably the most reliable, formula for the calculation of long stanchions and columns is that of Rankine, which is as follows:—

$$P = \frac{fs}{1 + a\frac{l^2}{r^2}}$$

Where f = ultimate resistance of material to compression in lb. per square inch. For cast iron 80,000

s = sectional area of stanchion in square inches

a = the reciprocal of the limit of elasticity of the material. For cast iron $\frac{1}{3,200}$

l = length of stanchion in inches

r = least radius of gyration

P = breaking weight of stanchion in lb.

A varying factor of safety must always be used with this formula, and is found as follows:—

$$\text{Factor of safety} = 4 + \cdot 07\ \frac{\text{length in inches}}{\text{least diameter in inches}}$$

It is required to find the dimensions of a stanchion with a height of 12 ft. to safely carry 54 tons dead load.

As a trial take a stanchion with a cross section, as shown in Fig. 1, and which has a sectional area of 19 sq. in.

The moment of inertia of the section

$$I) \quad \frac{bd^3 - b'd'^3}{12} = \frac{(6{\cdot}5 \times 37{\cdot}4) - (5{\cdot}4 \times 29{\cdot}5)}{12}$$

$$= 112{\cdot}6$$

Then $r = \sqrt{\frac{I}{A}} \qquad \sqrt{\frac{112{\cdot}6}{19}} = 2{\cdot}435$ in.

$$\frac{l}{r} = \frac{144}{2{\cdot}435} = 59$$

Then by formula—

$$P = \frac{fs}{1 + a\frac{l^2}{r^2}} = \frac{80{,}000 \times 19}{1 + \frac{1}{3{,}200} \cdot 59^2}$$

$$= 728{,}008 \text{ lb.}$$

The factor of safety $= 4 + \cdot 07\ \frac{144}{6{\cdot}5} = 5{\cdot}55$

Then safe load on stanchion $= \frac{728{,}008}{5{\cdot}55 \times 2{,}240} = 58{\cdot}56$ tons

This safe load is somewhat in excess of the requirements, but it would be found that a stanchion with a 6¼-in. side would be too small, and as the material is cast-iron the allowance is not excessive.

Stiffeners should be cast at about 3 ft. apart, as shown in Fig. 2, which also shows the base of the stanchion. The form of the cap would depend on the mode in which the load is to be transmitted to the stanchion. (J. W. S., *Clapham Junction.*)

NOTES.

[The following has been submitted in consequence of the editorial note appended to the reply to Question 267 in our issue of September 13th. Reference should be made to the further reply to the same question in our issue of September 20th, which deals more fully with the *heads* of a complete specification. Ed.]

CONVERSION OF MACADAMISED INTO A WOOD-PAVED ROAD: SPECIFICATION OF WORKS.

Excavation of Roadway. The existing roadway shall be excavated to a depth of 12 in., screened, and all suitable material laid aside to be used for concrete. Surplus soil to be carted from the works.

Cement and Concrete.—All cement to be used on the works shall be obtained from an approved manufacturer, and shall be subject to the usual tests. All concrete shall consist of 1 part of cement to 6 parts of the screened stone, which shall be clean and free from dust and dirt, and 1 part of keen, sharp sand, the whole to be thoroughly well mixed, and the usual quantity of water added. The concrete shall, when sufficiently mixed, be evenly spread to the required thickness, and rammed and levelled to a true and uniform face, and to proper gradients. If the concrete is laid in hot weather, it shall be frequently watered or covered, so that the surface may be kept moist. When the concrete has sufficiently set, it is

to be floated to a true surface with Portland cement and clean, sharp sand, in the proportion of 1 to 3 by measure, mixed with as little water as will enable it to be properly used.

Description of Blocks.—The wood blocks shall be of the very best description of Jarrah or Karri wood, 3 in. wide, 4 in. deep, and the bulk 9-in. long, cut with fibres vertical, true to gauge, free from all imperfections, thoroughly well seasoned, and equal in all respects to submitted samples. Any blocks varying $\frac{1}{8}$ in. in width or depth from the dimensions given will be rejected. The logs from which the blocks are cut shall have been out of water for at least three months. All inferior blocks brought on the works may be marked in such a manner as to ensure that they shall neither be used in the contract nor brought again upon the works.

Laying Blocks.—The floated surface of the concrete foundation must be swept quite clean before the work of laying the paving is commenced, after which the blocks must be laid in straight lines, with parallel courses at right angles to the channels. The blocks to be laid with both longitudinal and cross joints, of an approved width, and as small as possible, the blocks being placed close and driven in an approved manner. The contractor shall supply all necessary screeds, remove same, and fill in the space left with jointing material.

Bonding, &c.—The blocks shall be laid with proper bonded courses, and shall break joint in all cases. As few closers as is consistent with the proper breaking of the joints are to be used, and none will be allowed less than 4½ in. in length.

Channelling.—The channelling on each side of the roadway shall be formed by laying three rows of wood blocks parallel with the kerbing, with approved gradients and cross fall, the blocks to be laid breaking joint.

Expansion Joint and Kerb.—When the paving abuts upon the kerbs an extension joint of not less than 1½ in. shall be provided, and filled in with a mixture of clay and sand, or equally suitable and approved materials.

Paved Edges to Margins.—When the paving does not abut against the kerb a single longitudinal row of granite setts shall be laid to form a continuous edging to the blocks.

Camber of Surface and Paving round Covers, &c.—The surface of the paving shall be laid to an approved camber. The paving round manhole covers, ventilating covers, valve boxes, &c., shall be properly cut and shaped without extra charge. When the paving abuts against iron covers the adjacent blocks shall be laid at a level not less than ½ in., or more than $\frac{3}{8}$ in. above the top of the cover.

Protection from Inclement Weather.—After the blocks are headed up in position they should be covered with tarpaulins until they are permanently laid, and if from any cause they become wet after they have been laid and before they are grouted, they must be allowed to get perfectly dry before any grouting is proceeded with; and should any water get under them, or dampness appear on the top of the floating, they shall be taken up and not relaid until they and the surface of the floating have become thoroughly dry.

Works on One Side of Road at a Time.—The new work shall be carried out only on one side of the road at a time, and traffic shall not be allowed upon the paving for at least five days after its completion, so that work must be suspended for five days before the breaking up of the other side is commenced.

[This clause only relates to works on roads where it is impossible to close down for traffic.]

Uneven Paving.—Should any portion of the paving after completion be uneven, or retain water on its surface, it shall be taken up and relaid by the contractor at his own expense.

Tar Boilers.—The tar boilers to be of approved type, with provision for leading the gases from the molten pitch to underneath the fire-grate, and they must be in charge of capable men. If required, the furnaces are to be charged with coke. The boilers must be stationed as near as possible to the paving being jointed.

Method of Jointing Blocks.—The blocks to be laid immediately after being dipped, and placed not more than ⅛ in. from the adjoining block, and the joint thoroughly filled and flushed with the hot mixture to within 1 in. of the surface, rubber squeegees being used to sweep the liquid into the joints and prevent accumulation on the surface.

The surface of the wood paving is to be grouted with a mixture of 3 parts sand and 1 part Portland cement, brushed about with brooms until every joint is completely filled up.

Jointing Composition to be Boiling.—The greatest care is to be taken that the whole of the jointing material shall be poured into the joints while it is boiling, and not more than half a bucket of boiling material shall be taken from the boiler for jointing at one time. No jointing to be done in wet weather.

Covering up Paving.—When completed the paving shall be entirely covered with a sprinkling of granite chippings, ¼ in. in thickness, not less than ⅛-in. or more than ⅜-in. mesh. No paving to be so covered until permission has been received, and the contractor shall sweep off and remove the chippings when instructed to do so. (H. B., *Worcester.*)

Tar and Flooded Roads.—Of the 20 miles of road damaged by the recent floods in Huntingdonshire, the roads which suffered least (says the *Standard*) were those tar-painted or made of tar-macadam.

The Western Approach Road Scheme.—The Road Board's Approach Road Scheme for Western London has been the subject, recently, of a number of interesting communications in the *Standard* from road users and residents in the districts affected by the proposal. In Tuesday's issue of our contemporary prominence is given to a statement by Mr. H. Percy Boulnois, M.INST.C.E., late deputy chief engineer to the Local Government Board, member of the Advisory Engineering Committee of the Road Board, and vice-chairman of the Roads Improvement Association, who advances several arguments in favour of a by-pass road at Brentford. Mr. Boulnois' view is that London wants new outlets, altogether irrespective of the question of widenings, and he considers that an entirely new road would be better for traffic purposes than any widening at Brentford. He does not think it possible to have too many roads. Regarding the objections of shopkeepers, he points out that for them the wide thoroughfare is not ideal, and that it is in the narrow streets everywhere that the best trade is done. "It must not be forgotten," he adds, "that a wide road is very costly to maintain, to water and to scavenge. These points all serve to emphasise my contention that two roads are better than one."

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Chelmsford T.C. September 9th. Mr. M. K. North. £1,750 for the purchase of gas engine and engine-house at the Melbourne-road waterworks; £90 for works of sewerage in Rectory-lane; £450 for surface-water drainage in Newstead, Rectory-lane and Broomfield, and £340 for additional cattle pens, &c., in the market. The application for the £1,750 was supported by Councillor T. H. Waller, chairman of the Sewer and Water Committee. Councillor W. Harper suggested that it would be cheaper to extend the present corrugated-iron building. The borough surveyor, Mr. P. T. Harrison, said it was proposed to use the corrugated iron of the present building for a coal store, so that the material would not be thrown away. There was no objection in respect of the sum of £340 for new cattle pens, &c. With reference to the sums of £90 and £450, the town clerk, Mr. W. Smith, explained that plans had been passed for the erection of houses at the west end of Rectory-lane, and it was necessary that the sewer should be extended; and in consequence of the erection of the Marconi Works and other buildings, surface-water drainage was also considered necessary in the other streets referred to. The borough surveyor explained the plans.

Frinton U.D.C. (September 4th. Mr. F. H. Tulloch).—This was an application for sanction to borrow money for providing a cemetery on land at Kirby Cross.—Dr. H. W. Godfrey, medical officer of health, said the present burial ground was practically full, and the new site they had decided upon seemed to him to be really most suitable, regarding the aspect, subsoil and other things. Drainage of the site could be carried out efficiently without any source of danger to residents, and the effluent would be treated bacteriologically. There was considerable opposition to the scheme.

Hull T.C. (September 26th. Major J. Stewart).—£1,200 for the purchase of land in Gillett-street, £25,661 for street improvement and sewerage, and £2,175 for land on Hessle-road for the purpose of an open-air recovery school and playing fields.—It was stated that the corporation had an option of 6 acres of land on Hessle-road, at the present valuation, at £300 per acre. The school was intended for delicate and tuberculous children, and when the district was built [illegible] Evidence was also given with respect to the street and sewerage schemes.

Leyton U.D.C. (September 17th. Major J. Stewart).—[illegible] Hall.—The surveyor, Mr. E. H. Essex, stated that [illegible] about thirty years ago. The council had not yet determined whether the work should be done by [illegible] The length of the sewers to be constructed was 2,100 lin. yds. and the number of [illegible] 1,282.

New Forest R.D.C. (September 17th. Mr. Edgar Dudley).—[illegible] at the corner of the Rosery-road, and erecting [illegible] Details of the scheme were explained by Mr. I. Sanders, surveyor and architect. He stated the sum asked for the property was £1,150. After the purchase there would be about 2½ acres for building, and the [illegible] £1,000 of the total sum and £37 6s. 8d. of the annual cost. The cost of the property [illegible] £1,150.

Stamford T.C. (September 28th. Major J. Stewart).—[illegible] —The borough surveyor, Mr. T. F. R. Ryman, explained the scheme, and said he did not think the present works could be adapted to deal with the sewage adequately without the expenditure of the sum asked for. The inspector remarked that he was [illegible]

Swansea T.C. [illegible] £1,000 for the compulsory purchase from the Victoria Park Trustees of Mansel-road, and the Mumbles and London and North-Western Railways, to the Sand [illegible] £1,000 for the purpose of street improvements in Worcester-place.—The town clerk, Mr. H. Lang-Coath, explained that the corporation, having acquired the foreshore, desired now to connect the park with the Sands by means of a reinforced-concrete bridge, for which a tender of £1,147 had been received. The structure would supply a long-felt want in the town, and obviate what was at times a very dangerous state of affairs by reason of the crowds going to and from the Sands at two level crossings at the Slip. The inspector stated that a reinforced-concrete bridge, such as was proposed, would be the first of its kind in this country, and he would require trial holes to test the foundations for the bridge, and information as to the various levels of the water during spring and extraordinary spring tides, and, in the circumstances, he would adjourn that part of the inquiry *sine die*. The borough surveyor, Mr. Geo. Bell, gave the necessary explanatory details of the street improvement scheme.

Yeovil T.C. (September 18th. Mr. Edgar Dudley).—£1,225 for the construction of a new street from Earl-street to Middle-street.—The town clerk, Mr. H. Copeland Batten, stated that there was a considerable amount of traffic at the present time at the approach to the town station, and it was certainly somewhat congested. Middle-street, which was the main thoroughfare of the town, was very narrow, and the council's idea was that if there was a road opposite the town station it would greatly relieve the traffic in Middle-street, and prove a great boon to people living in that neighbourhood. Another fact was that this part of the town was greatly in need of being opened up, and the council had been wishing to bring about this work for a considerable time. The street was to be 36 ft. wide. The borough surveyor, Mr. A. Oddy, gave details of the construction of the street, and said the surface of the carriageway would be of macadam, and that of the footway of asphalt.

Yiewsley U.D.C. (September 11th. Mr. Edgar Dudley). £400 for the purchase of land at the junction of High-street and Fairfield-road, as a site for public offices.—The site comprises the present offices, with the two cottages adjoining, together with a piece of land at the rear. It was stated that the council were at present tenants of their offices, and that it was proposed to purchase the freehold of the properties, and to continue to make use of these premises until they were in a position to build new offices.

APPLICATIONS FOR LOANS.

Brighouse T.C. £18,500 for sewage outfall works.

Colne T.C.—£2,100 for works of conversion to the [illegible] system.

Eastleigh U.D.C.—£1,250 for sewerage and £450 for road improvement purposes.

Harrow U.D.C.—£1,150 for building cottages and [illegible] and £440 for sewerage to the isolation hospital.

Hinckley U.D.C.—£5,800 for works of sewerage.

Ipswich T.C.—£440 for sewer extensions.

Penrith R.D.C.—£150 for a branch water main.

Sunderland T.C.—£110 for school enlargement.

Tamworth T.C.—£3,000 for laying out pleasure [illegible]

Tilbury U.D.C.—£900 for new equipments for street lighting.

LOANS SANCTIONED.

Acton U.D.C.—£7,865 for the reconstruction of carriageways with tar-macadam, £1,493 for the purchase [illegible] and £415 for works of sewerage (twenty years and eighteen years respectively from the date of borrowing) in connection with the expenditure incurred under the Acton Street Improvements Provisional Order, 1905.

Cambridgeshire C.C.—£1,600 for new county buildings.

Caxton R.D.C.—£400 for works of water supply.

East Ham T.C.—£8,628 for a fire station and fire-[illegible] dwelling.

Stone U.D.C.—£592 for the widening of North-street.

Stone R.D.C.—£425 for sewerage works.

Wrexham T.C.—£1,800 for extensions to electricity [illegible]

Superintending Sanitary Engineer Wanted.—We have attention to an announcement in our advertisement pages of an appointment as superintending sanitary engineer for service in the Gold Coast. It will be observed that applications have to be addressed to Mr E. White Wallis, the secretary of the Royal Sanitary Institute and must be received by Tuesday next. We draw attention to the appointment at the earliest opportunity afforded, and are not, therefore, responsible for the briefness of the period remaining for sending in applications.

MOTOR 'BUS *v.* TRAMCARS.

By A "Surveyor" Engineer Correspondent.

The advocates of tramcars have been having it all their own way at the recent conference of tramway managers, and from the point of view of these prejudiced persons the motor 'bus is an abominable nuisance, which ought to be suppressed, or so heavily taxed that it would be unable to compete with the tramcar. But let us take a dispassionate view of the whole question. The horse-drawn tramcar came from America, and was introduced into this country when there were only horse omnibuses of inferior construction and incommodious interior. Then came the tremendous boom of overhead electric traction, and for many years the tramcar had it all its own way. But with the advent, and great developments, of the motor omnibus all this has been altered. This new vehicle combines all the advantages of the tramcar, with none of its drawbacks. It requires no special expensive railway on which to run. It is independent of a breakdown in the whole system by an accident to the central power station, or of a temporary breakdown in a tramcar which similarly stops all the cars behind it. It carries its own power (petrol), and is independent of coal strikes. It is flexible, and, if obstructed by traffic, can diverge to either right or left, and thus pass the obstruction, whereas a whole line of tramcars can be, and frequently is, blocked by an obstruction on the rigid road on which they are compelled to run. A motor 'bus can keep the "rule of the road," and thus avoid disturbance to other traffic, whereas a tramcar is fixed on a rigid road, and is unable to give way, either to right or left, thus frequently causing serious obstruction to the general traffic and even danger to the public. To pass a tramcar on the wrong side, which has frequently to be done, is dangerous, and to pass it on the "off" side constitutes an equal danger, as another tramcar may be coming, and the excessive length of a tramcar makes this operation one of painful anxiety while it lasts. The tramrails also offer a tempting track for heavy horse traffic, and where these are in the centre of a road a long line of slowly moving vehicles in the centre of a road is a serious obstruction and source of danger to the other more rapid traffic.

As to the public convenience, the motor 'bus can stop to let down or pick up a passenger at any point, whereas a tramcar only stops at certain stopping places. Nothing is more exasperating than just missing a tramcar because a would-be passenger is some 30 yds. or 40 yds. short of a stopping place, and a breathless run only makes him just miss the car. The fact is that the tramways in our streets have become a dangerous monopoly of public thoroughfares, which were never intended for railways, but for the use of the general traffic. Anyone who has eyes and observation can see a dozen or more places in London where the tramway traffic causes the most serious obstruction to the general traffic, and consequent loss of money to traders. A very large percentage of serious street accidents is caused, either directly or indirectly, by the presence on their fixed lines of these huge "Juggernauts," which are unable to budge a single inch in order to relieve the pressure of the moment. It was all very well to argue that the tramcar was essential for the convenience of the general public in the old days of the horse omnibus, but now that equal, if not better, facilities are provided by the modern motor 'bus, it is quite time that railways should no longer be permitted in our streets.

The London County Council and other local authorities have "gone nap" on tramways, and vast sums of the ratepayers' money have been invested in this method of mechanical traction, which is already doomed to failure on account of its many imperfections in the light of recent developments in mechanical traction. It would be well if these authorities could realise this before committing themselves to further useless expenditure on a system of street locomotion which is already quite behind the times, and in a few years will be obsolete. Motor 'buses are with us, and in the form of "trackless trams" they are coming.

Hay (Brecknock) Sewage Disposal Scheme.—Messrs. Willcox & Raikes, of Birmingham, are the engineers of a scheme promoted by the Hay Urban District Council for the treatment of the sewage on bacterial lines.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Denbigh, Devon £13,500, Luton £13,545, Newton Abbot; housing and town planning—Tilbury; roads and materials—Brentford, Devon; sewerage and sewage disposal—Brighouse £18,500, Fareham £12,831, Leigh, Tredegar £21,279; miscellaneous—Edinburgh.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Derby T.C.—The salaries of ten members of the professional and clerical staffs in the surveyor's department have been increased by £95 per annum in the aggregate.

Tutbury (Staffs) R.D.C.—The clerk, at a recent meeting, read a circular-letter from the Local Government Board with reference to by-laws as to new streets, buildings, &c. Questioned by a member, the surveyor, Mr. H. S. Tebbitt, stated that some of the by-laws in force in the council's area were too stringent, and might, with advantage, be relaxed. Some of the regulations, he added, were so strict that they did not enforce them—not at all a business-like method of procedure.

BUILDINGS.

Aldershot U.D.C.—The surveyor, Mr. F. C. Uren, has been instructed to prepare plans for underground conveniences in the municipal gardens and in the grove.

Banffshire C.C.—The Keith District Committee recommend that a bridge and approaches for cart traffic be constructed at Mill of Tombreckachie, at an estimated cost of £150.

Cardiff T.C.—The Parks Committee recommend the provision of an open-air bath, 200 ft. by 50 ft. Mr. W. Harpur, the borough engineer, informed the committee that the cost of the bath would not at the outside exceed £2,000.

Chester T.C.—Sir Francis Fox, M.Inst.C.E., has presented a report on the condition of Old Dee Bridge, in which he recommends that the weak portions of the foundations should be filled with hydraulic cement by means of a grouting machine.

Denbigh T.C.—Plans have been prepared for a new town hall and market, and it is intended to apply for a loan for the erection of the buildings.

Devon C.C.—A scheme has been passed for the building of a sanatorium with ninety beds, at a cost of £13,500. Dispensaries are also to be provided.

Erith U.D.C.—The tender of Mr. J. W. Ellingham, of Bexley Heath, at £357, has been accepted for the erection of a convenience at Abbey Wood.

Finchley U.D.C.—The tender of Messrs. C. Halls & Co., at £1,339, has been accepted for the erection of a public convenience.

Luton T.C.—The tender of Mr. T. Higgs, of Northampton, at £13,545, has been accepted for the erection of public baths.

Newton Abbot U.D.C.—A committee has been appointed to consider several suggested schemes for public baths.

Plymouth T.C.—Workshops are to be provided at the Compton tramways depot, at an estimated cost of £800.

Scarborough T.C.—The borough engineer, Mr. H. W. Smith, has received instructions to prepare plans for the erection of seven bungalows and a convenience at the north-east corner of the land south of the Spa.

HOUSING AND TOWN PLANNING.

Battle U.D.C.—The Local Government Board have written approving generally of the council's housing scheme, and suggesting that it should be extended by the provision of further dwellings.

Branston R.D.C.—The tender of Messrs. Wallhead Bros., of Ruskington, at £1,408, has been accepted for the erection of eight workmen's dwellings.

Burnley T.C.—It has been intimated that the decision of the Local Government Board with respect to the proposed closing of certain houses as unfit for habitation is in favour of the corporation.

Liverpool T.C.—The number of dwellings now owned by the municipality is 2,663, classified thus: 193 one-roomed, let at 1s. 6d. to 2s. 6d., according to position; 1,227 two-roomed, 2s. 6d. to 3s. 6d.; 960 three-roomed, 3s. 6d. to 4s. 6d.; 273 four-roomed, 4s. 6d. to 5s. 6d., the latter including fifty-two self-contained cottages in the Bevington-street area, recently opened. The total gross rental is £26,750 per annum. Of this, £21,370, or 98·20 per cent of the total rental, was collected last year, the Bevington-street area, of course, not being included in this calculation. The capital expenditure involved approximates to about £1,100,000.

Tilbury U.D.C.—On Monday evening the council passed a resolution deciding to proceed with the first portion of their new housing scheme, and their surveyor, Mr. S. A. Hill-Willis, was instructed to bring up plans and specifications for 100 houses, and to make arrangements for engaging, and ascertain the terms of, an architect of repute to assist him in the elevations and advise generally on the design.

PARKS AND OPEN SPACES.

Ellesmere Port U.D.C.—A sub-committee has been appointed to select a site for a public bowling green.

Oldham T.C.—The borough surveyor, Mr. E. C. Foote, has prepared a scheme for laying out the Hargraves Recreation Ground, Oldham Edge. The proposals comprise two bowling greens, bowl-house and shelter, rebuilding the wall in front and surmounting it by ornamental iron railings, fencing elsewhere, and drainage of the bowling greens to a sump manhole.

Tamworth T.C.—The council have approved the scheme of the borough surveyor, Mr. F. E. G. Bradshaw, for laying out the pleasure grounds and incidental works, at an estimated cost of £3,000.

REFUSE COLLECTION AND DISPOSAL.

Guildford T.C.—In consequence of coal having to be used to drive the plant of the dust destructor in the absence of sufficient refuse, due to the increased use of gas stoves, an estimated annual saving of £160 on the destructor scheme has been converted into a deficit of £825, which is equal to a charge on the rates of 1½d. in the £.

Pontypool U.D.C.—The tender of Messrs. Heenan & Froude has been accepted for the erection of a refuse destructor. The estimated cost of the scheme is £1,600.

ROADS AND MATERIALS.

Alnwick R.D.C.—A committee has been appointed to consider the question of forming a new road from Shilbottle Colliery and the Greenrigg Kennels.

Banffshire C.C.—A letter was read at the last meeting of the Keith District Committee from the clerk to the Elgin County Council regarding the administration of the Road Improvement Fund by the Road Board, and suggesting that steps be taken to induce the Road Board to alter their policy with regard to the matter. It was agreed to ask Captain Waring, M.P., to discuss the question with Sir Archibald Williamson, to enable the northern counties to obtain a share of the money unrestricted by impossible and unnecessary conditions.

Brentford U.D.C.—Sir George Gibb, chairman of the Road Board, has intimated the county that the final and decisive view of the board was that they could not entertain any idea of widening Brentford High-street; 90 per cent of the traffic through the street was not local. He intimated that an Act of Parliament would have to be promoted for the new motor road which the board proposed to construct.

Camberwell B.C.—The Works Committee recommend the council to concur in the objection raised by the Stepney Borough Council to the overhead system of traction being established in any thoroughfare in the Metropolis unless the consent of the local authority has been obtained.—The borough engineer, Mr. W. Oxtoby, reports that he has made an application to the Road Board for a grant towards the cost

of widening Red Post-hill.—The borough engineer, pursuant to instructions from the Works Committee, has prepared a cartoon plan showing a line of suggested road improvement from Dulwich to Old Kent-road. The route followed is from Lordship-lane at the junction of Crystal Palace-road in a northerly direction along Crystal Palace-road, across Goose Green, along Adys-road to Oglander-road, thence by a new spur road to Bellenden-road, along Bellenden-road, Victoria-road, and Victoria-place, to High-street, Peckham, and thence along Sumner-road and Trafalgar-road to Old Kent-road. The committee consider that if the necessary widenings were effected this route would form a very desirable one for the construction by the London County Council of a relief tramway, which would materially improve the present means of communication between Old Kent-road, Peckham, and Dulwich, and would also lessen the number of cars required to pass over Dog Kennel-hill.

Chislehurst U.D.C.—The council have agreed to the offer of the Metropolitan Water Board with regard to the charge to be made in respect of the use of water for road repairs, that 3 per cent of all water taken by the local authorities from the metered standposts shall be deemed to be used in respect of road repairs and paid for at the rates specified in sec. 16 of their Charges Act of 1907.

Coventry T.C.—Land is to be purchased in order to widen the High-street on the south side.

Derby T.C.—For the purpose of street widening, property in Osmaston-road is to be purchased for £875. The Improvement Committee also ask for £375 for the acquisition of 1,548 yds. of land between Nottingham-road and Francis-street.

Devon C.C.—The Road Board propose to make a grant of £13,430 for road improvements, exclusive of the sum of £5,000 which has been set aside for widenings, improvement of corners, and similar kinds of road works. The board also offer to advance £20,000 on loan to the council, free of interest, in order to expedite the work of road improvement.

Dundee T.C.—A Provisional Order is to be promoted for the scheduling of property in Overgate and behind the Town House in furtherance of the improvement scheme.

Hailsham (Sussex) R.D.C.—The council passed the following resolution last week: "This council is of opinion that the revenue from the duty on petroleum and motor licences should be distributed to all the road maintenance authorities in the area of collection, and that the distribution should be proportioned according to the amount expended on materials by such authorities."

Heiston R.D.C.—The necessary land having been given for a road to avoid the widening of the two corners in Gunwalloe-road, it has been agreed to make an application to the Road Board for a grant towards the cost of the work, which the surveyor (Mr. C. E. Bearden) estimates will exceed £400.

Montgomery C.C.—The Main Roads Committee reported at the recent meeting of the council that, having heard the proposals of the county surveyor (Mr. G. A. Hutchins), they were of opinion that the creation of a special plant for making tar-macadam should be deferred until it could be ascertained whether tar-macadam was a success. Mr. Naylor said he thought tar-macadam had proved a success, but the report seemed to indicate otherwise. The county surveyor said he thought the tar-macadam put down in their county was perfectly satisfactory. The thing they wished to consider was whether it was more economical than ordinary macadam, and one year's experience was not enough to judge by. Mr. Hurlbutt said there was the published experience of other counties to judge by that tar-macadam was an economic success. Eventually it was agreed that the county surveyor should prepare a report based on the experience of their own and other counties as to whether tar-macadam was advisable.

Plymouth T.C.—Tenders have been accepted for making up the undermentioned thoroughfares at the cost of the owners, as follows: Kingswood Park-villas, Pethick Brothers, £557; Endsleigh Park-road, Pethick Brothers, £348; Gwynn-road, Section 4, T. Shaddock, £197.

Saffron Walden T.C.—Victoria-avenue is to be made up according to the plan and estimate of the borough surveyor, Mr. A. H. Forbes, at a cost of £863.

Southend T.C.—The tenders of Mr. W. Iles, of Southend, at £16,135, have been accepted for making up work, and for the formation of a new thoroughfare for light railway extension.

Tewkesbury T.C.—The borough surveyor, Mr. W. Ridler, has received instructions to tar the footways during the autumn.

Withernsea U.D.C.—A resolution has been passed by which the council agree to contribute towards the construction of two groynes on a three-quarter basis on condition that the whole of the frontagers convey the necessary land for a 40-ft. roadway.

SEWERAGE AND SEWAGE DISPOSAL.

Brighouse T.C.—A scheme for the extension of the sewage outfall works at Cooper Bridge, at an estimated cost of £18,500, has been approved.

Earby U.D.C.—The surveyor, Mr. J. E. Aldersley, has been asked to modify his plan and scheme for sewage disposal works, in order to reduce the cost.

Fareham R.D.C.—Plans for the sewerage of Lee-on-the Solent, at an estimated cost of £12,831, have been forwarded to the Local Government Board.

Hexham R.D.C.—The tender of Messrs. J. W. Henderson, of South Gosforth, at £2,285, has been accepted for the sewer extension at Painshawfield.

Kidderminster T.C.—Messrs. Willcox & Raikes have been appointed to report on the additional land proposed to be acquired for sewage disposal purposes at Birchen Coppice and Dropping Wells Farms, with a view to an application being made to the Local Government Board for permission to borrow £13,500 to complete the purchase of the land.

Leigh (Essex) U.D.C.—The council have approved the preliminary scheme for the construction of a new main outfall sewer to relieve the existing old town sections.

Linthwaite U.D.C.—The tender of Messrs. J. Wimpenny & Co., at £887, has been accepted for the supply of earthenware pipes and manholes.

Newcastle (Ireland) U.D.C.—The council have asked the Local Government Board to hold an inquiry into their proposed sewerage scheme, with foreshore outfall.

Spalding U.D.C.—The Sanitary Committee have a drainage scheme under consideration.

Stoke-on-Trent T.C.—A sludge-pressing plant is to be installed at the Tunstall sewage works, at an estimated cost of £520.

Tredegar U.D.C.—The tender of Messrs. W. Waring & Sons, of Huddersfield, at £21,279, has been accepted for the carrying out of the district sewage disposal scheme.

WATER, GAS, AND ELECTRICITY.

Cardiff T.C.—A sum of £11,250, with an additional £1,250 as compensation for the effect on other land, is to be paid for 50 acres of land at Cwm Taff, in connection with the new Llwynon reservoir.

Chelmsford T.C.—The borough surveyor, Mr. P. T. Harrison, has been instructed to prepare alternative estimates of wells 7 ft. and 8 ft. in diameter for a depth of 400 ft.

Edinburgh T.C.—Two new cooling towers have been erected in connection with the electric lighting station at Dewar-place. The towers were rendered necessary owing to the introduction of turbine machinery to be worked in connection with the new condensing plant. The extra plant will be capable of producing an increased output of about 3,500,000 units a year, making 10,500,000 units, and the saving in coal will then be over £10,000 a year. The whole scheme has cost about £45,000.

Evesham T.C.—The borough surveyor, Mr. H. Harvey, has received instructions to lay a new 4-in. water main, with sluices, in King's-road, as far as the upper end of North-road, and a 3-in. main to the north end of King's-road.

Howden R.D.C.—The scheme prepared by Mr. Percy Griffith, Westminster, for a new supply of water for the district has been approved, and Mr. Griffith has been engaged as engineer to carry it out. Application has been made to the Local Government Board for a Provisional Order under the Public Health Act, 1875, for the purchase of land, and meanwhile a trial bore is to be laid down.

Leeds T.C. The tender of Messrs. Leech, Goodall, & Co., at £15,632, has been accepted for an installation of one bench of five beds of Dessau vertical retorts at Meadow-lane gasworks.

Newmarket U.D.C.—The Newmarket Gas Company's tender, at £975 per annum for ten years, has been accepted for the public lighting of the district.

Pontardawe R.D.C.—It has been decided to grant facilities to Messrs. Gilbertson & Co. for the installation of the electric light in certain parts of the business places of the town.

Slough U.D.C.—The local waterworks have been taken over, and will henceforth be administered by the council.

MISCELLANEOUS.

Edinburgh T.C.—The subject of tramway extensions, which has been in abeyance for a year, has been again under consideration of the Tramway Committee. Railless traction was the last system discussed, the question to permit of the officials learing the results of experiments in London being postponed. Last week the city engineer, Mr. A. H. Campbell, reported briefly on the three systems—railless, self-propelled cars, and motor omnibuses. It was finally remitted to the Sub-Committee on New Tramways, and the city engineer to obtain a report about the three systems, with costs, &c. If so advised, the council will apply for Parliamentary powers, it being understood that these would be required even for a system of omnibuses.

Hollingbourne R.D.C.—Messrs. Chittenden & Simmonds' quotations of 2s. 10d. per hour for providing steam rollers, and 3s. for scarifying 100 super. yds., have been approved. The estimate of Messrs. Haynes Brothers for tools, and a quotation of £4 2s. 6d. for three wheelbarrows, by Messrs. Shilling & Cripps, Boxley, have also been accepted.

Llandudno U.D.C.—Owing to the introduction of mechanical improvements and the use of mechanical stokers, the council saved £1,100 in fuel during the last financial year at the electricity works, and, notwithstanding a reduction in the price of current, a nett profit of £884 was made.

PERSONAL.

Mr. D. T. G. Brown, surveyor to the Sherborne Urban District Council, has had his salary increased by £35 per annum.

Mr. James S. Smith, surveyor to the Kintyre district of the Argyll County Council, has had his salary increased by £50 per annum.

Mr. P. J. Kelly, assistant surveyor to the Londonderry Corporation, has been appointed surveyor to the Northern District of Donegal.

Mr. Fred. S. Clarkson, assistant surveyor to the Fleetwood Urban District Council, has accepted the position of surveyor to the Fleetwood Estate Company.

Mr. A. James Meeson, surveyor to the Brentwood Urban District Council, has been elected a member of the Institution of Municipal and County Engineers.

Mr. H. Cackett, surveyor to the Redruth Rural District Council, has been voted an increase of salary from £104 to £130 per annum. He made a request to the council for a testimonial, upon which a discussion ensued, and after it had been stated that the council would have to pay £150 a year if they advertised for a successor the advance of salary was granted.

Mr. Joseph Robinson, assistant county surveyor of County Longford, while inspecting roads in his district was set upon and severely injured at Newtownforbes by a road contractor, who, it appears, had been struck out in respect of a road contract. He was taken to the Lanesborough Workhouse, where Dr. Delany was called in and dressed several wounds on his head.

Mr. John Dixon, of Peak Mount, Consett, died on August 31st, at the age of 67 years. Mr. Dixon assisted in the erection of the old Town Hall, Consett, which was burned down some years ago. Afterwards he became surveyor and inspector to the old Local Board at Consett, and for over a quarter of century he occupied similar positions under the Benfieldside Local Board and the Benfieldside Urban District Council. He retired about ten years ago, and was subsequently elected a member of the council, but, owing to failing health, he relinquished office after holding it for two years.

Mr. E. A. Brookes, county surveyor of Cornwall, was the victim of a misstatement in a local newspaper which has now been explained by the clerk of the St. Columb Rural District Council, Mr. C. E. Whitford. The latter, according to the report, stated that "the office of the county surveyor" was in a regular muddle. Mr. Whitford told the members of his council that he never said anything of the kind, for he had never been in that office. He would like to make it plain that he did not make use of the remark, but, arising out of a recent question between them and the county council over the highway account, he suggested that their surveyors and assistant clerk should go to the county surveyor's office to unravel the muddle which existed.

FOR OTHER ADVERTISEMENTS
See End of Paper.

CROYDON RURAL DISTRICT COUNCIL.
TO WOOD PAVING CONTRACTORS AND OTHERS.

The above Council invite Tenders for Laying approximately 10,800 super. yards of Soft-Wood Paving in the London-road, Mitcham, and in High-street, Collierswood.

Plans and Specification, prepared by the Council's Surveyor, Mr. Robt. Chart, junr., can be inspected, and Forms of Tender obtained, at his Offices, Katharine-street, Croydon, on payment of £2 (which will be returned on receipt of a *bonâ-fidê* Tender).

Sealed Tenders, endorsed "Tender for Wood Paving," must be delivered to the undersigned before 12 o'clock noon on Thursday, the 17th day of October, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

E. J. GOWEN,
Clerk to the Council.

Council Offices,
Katharine-street, Croydon.
October 1, 1912.

HOWDEN RURAL DISTRICT COUNCIL.
TRIAL BORING AT SOUTH NEWBALD, EAST YORKS.

The Council are prepared to receive Tenders for the Construction of a Trial Boring in the Parish of South Newbald, in the East Riding of Yorkshire, and for Testing the Yield of Water therefrom. Copies of the Specification and Form of Tender can be obtained from the Engineer, Mr. Percy Griffith, M.INST.C.E., F.G.S., 20 Victoria-street, Westminster, S.W., on payment of a deposit of Two Guineas (by cheque), which will be returned on receipt of a *bonâ-fide* Tender by the date named below.

Sealed Tenders, endorsed "Tender for Trial Boring," to be delivered to the undersigned not later than Friday, October 11th, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

By order of the Council,
HENRY GREEN,
Solicitor and Clerk.

Howden, East Yorkshire.

SURVEYOR'S CLERK.

The Frimley Urban District Council require the services of a General Clerk in the Surveyor's Department, at a salary of £52 per annum. Applicants must be good shorthand writers and typists, and must have had previous experience in a Surveyor's Office. Applications, in applicant's own handwriting, stating full particulars as to age, experience, &c., accompanied by copies of not more than three recent testimonials, to be sent to Mr. T. Clement James, Surveyor, Municipal Buildings, Camberley, not later than first post Saturday, October 12th, 1912. No forms of application.

REQUIRED, for a few months, in London, a Draughtsman capable of preparing plans, specification, &c., in connection with a small bridge, and incidental building works.—Reply, stating salary required, &c., to Box 1,185, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

Institution of Municipal and County Engineers.

EAST MIDLAND DISTRICT MEETING AT ILKESTON.

A well-attended meeting of the Institution of Municipal and County Engineers was held on Saturday last at Ilkeston. As recorded elsewhere in this issue, new sewage disposal works for the town were opened on Wednesday last, and the members were enabled to make a close examination of the undertaking in the course of the afternoon, a detailed description of the works, prepared by Mr. H. P. Raikes, the engineer, being circulated for the convenience of those taking part in the inspection. This, together with papers on the water supply and tramway and electricity undertakings, by Mr. H. J. Kilford, the borough surveyor, and Mr. H. P. Stokes, the borough electrical engineer, formed the subject of an interesting discussion at the meeting, at which Mr. R. J. Thomas (Buckinghamshire), the president, occupied the chair, others present including Messrs. E. W. Booth (Manchester), H. Bottomley (Bingley), W. Burn (Sutton-in-Ashfield), J. Clarke (Sleaford), W. G. J. Clarke (Wigston Magna), R. E. Clarke (Arnold), R. C. Cordon (Belper), H. J. Coleby (Atherstone), C. A. Clews (Derby), W. H. A. Court (Leicester), E. H. Crump (Hinckley), A. H. Elliott (Nottingham), E. J. Elford (Southend-on-Sea), T. Frank (Ripon), A. D. Greatorex (West Bromwich), J. R. Hadfield (Uttoxeter), J. C. Haller (Carlton), T. Henry (Retford), E. Purnell Hooley (Notts), J. D. Kennedy (East Retford), J. Lobley (Stoke-on-Trent), R. A. MacBrair (Lincoln), W. B. Madin (Rushden), S. Maylan (Basford), E. G. Mawbey (Leicester), R. Oakden (Newark), J. A. Settle (Heywood), P. H. A. Smith (Leicester), S. Turner (Ashby-de-la-Zouch), A. G. Wheeler (Eastwood), C. F. Wike (Sheffield), J. E. Wilcox (Birmingham), F. W. Wright (Ilkeston); Alderman C. A. Sudbury, J.P. (chairman Finance Committee, Ilkeston), Alderman Moss (chairman General Works Committee), Alderman Beardsley (chairman Gasworks Committee), H. J. Kilford (borough surveyor), S. S. Robinson (assistant surveyor), H. P. Stokes (tramway engineer), G. Knowles (assistant town clerk), F. C. Humphreys (gasworks manager), J. Baker (chief sanitary inspector), J. E. Carter, E. H. Colgrove, H. Collins, J. R. Elliot, W. S. J. Haseldine, H. L. Hall, W. Harvey, C. F. Hodson, W. Keay, H. P. Raikes, C. Raynor, F. Rist, F. M. Royle, H. H. Sands, W. Sanders, A. J. Smith and F. Tuckey.

In receiving the members at the free library, the Mayor (Councillor S. Shaw, J.P.) said that everyone who studied the numerous costly and important works carried out by the public authorities of this country must be impressed by the responsibilities placed on the shoulders of municipal engineers. Their duties imposed a thousand-and-one claims upon their attention, and it seemed to him that no department of a public body was independent of their help. The thoroughness with which municipal undertakings were usually carried out always appealed to him, and it was his hope that that condition of affairs would continue, and that the municipal engineer would never sacrifice good work in the mistaken idea of effecting economies. He was afraid there was a tendency at the present time to do work on a cheaper scale, but he trusted the day was far distant when the members of the municipal engineering profession would adopt such methods. The nation owed its present position to the solidity underlying all our manufactures, and his belief was that if they continued on the same lines in all they undertook they would always hold their own with their competitors in other countries. There was little of historic interest in Ilkeston to show them, but although they were a young borough they were a very progressive one, for, as they were aware, they were the owners of the town's gas, water and tramway undertakings. He was obliged to admit, however, that so far as the tramways were concerned they were like the people who "married in haste and repented at leisure," for, although they were the first town in Derbyshire to have electric tramways, they were the first to regret having them. His Worship, in conclusion, expressed regret that, owing to a severe operation which he was obliged to undergo about three weeks before, he would be unable to accompany the members on their visits of inspection during the day, but he trusted that their stay in the town would prove an enjoyable and instructive one.

The President (Mr. R. J. Thomas), in proposing a vote of thanks to the mayor, warmly acknowledged the compliment paid to the institution by his Worship in being present in person to receive them, despite his recent illness. In the course of further remarks, Mr. Thomas said that what had struck him particularly was the pertinacity of the town council in determining to find an ample supply of pure water. He had to congratulate the engineer on the ingenious manner in which he had overcome the very intricate problems which had presented themselves in the past, and sincerely hoped the result would be that no trouble would be experienced in the future.

Mr. E. G. Mawbey (Leicester), in seconding the proposition, also thanked the mayor for being present at the meeting under such physical disadvantages, and commented on the pluck shown by his Worship in attending to welcome them. Mr. Mawbey added that great progress was being made by the institution. One result of their work was a distinct improvement in the qualifications of the younger members of the profession, and the production of a really splendidly trained body of men whose services should prove of the greatest benefit to the public authorities of the country.

The President, in conveying the thanks of the meeting to the mayor, wished the latter a speedy return to health.

His Worship having made a short acknowledgment, the members left the town hall and proceeded in tramcars to the Stanton Iron Company's works at Hallam Fields, over an hour being devoted to a tour of the various departments of the huge establishment. Afterwards at luncheon, which was provided at the company's hotel, adjoining the works, a vote of thanks was accorded to the company for the facilities granted to the members. Referring to the process of pipe manufacture carried on by the firm, the President observed that it was most gratifying to find that they in England could produce such work, carried out in such a capital way, without waste or loss. Not only was the waste slag produced there used, but 50 per cent more was sold than they made, this being explained by the fact that some 2,000,000 tons had accumulated at the works from their operations in the past.

Mr. G. J. Ward made a short response on behalf of the Stanton Iron Company, and the ordinary business of the meeting was then resumed.

Election of District Executive Committee.

The President, in asking Mr. E. G. Mawbey, chairman of the district, to take the chair during the transaction of this business, said he should like to make a few remarks on the subject of district committee work. Having congratulated Mr. Mawbey on his appointment as chairman of the East Midland district, Mr. Thomas proceeded to appeal to the members to treat the matter before them with every elasticity as a first attempt at the formation of what he believed would prove to be a valuable auxiliary to the work of the institution. It was not his intention to suggest that they should blindly follow what other districts had done, but decide for themselves what was most suitable for their own district. In discussing district work, only members of the district were entitled to speak or vote. In the South-Eastern District—Kent, Surrey and Sussex—they met a few days ago and elected twelve representatives on the executive committee. Of those twelve they decided that three should be of the associate class, the younger members—which he felt they would agree with him was the right thing to do. The chairman was elected already, he was, therefore, *ex officio* a member of their committee. They had also elected Mr. Hooley on the council proper. It was quite open to them to elect or co-opt Mr. Hooley a member of the committee. What he had described was done at Grays on the previous Saturday, twelve being appointed on the committee, three being associates. What he wanted to suggest was with reference to the work of this district committee. The whole idea was to get into closer touch with each other, and in order to do this it was obvious that they would have to have more meetings. Those meetings could be held in the evening, if they so desired, during the winter.

The objection generally raised to winter meetings was that the days were so short that they could not see the works in daylight. One way to get over this was to arrange first to have their reception by the local authority, then at once to inspect the works while daylight lasted, get back, have a cup of tea and a pipe, and discuss things. There was a good deal to be said in favour of seeing works first and discussing them afterwards. They were very keen that this new move should result in larger numbers. He left it to their district to do all they could to induce engineers in whom they had confidence, and who, they knew, would be a credit to the institution, to put up for membership. The Orphan Fund held a very large part in their thoughts at times, and particularly at the present time. He would give them.

The Mayor of Ilkeston
(Councillor S. Shaw).

Alderman Moss,
Chairman of General Works Committee, Ilkeston.

Alderman C. A. Sudbury, J.P., C.C.,
Chairman of Finance Committee, Ilkeston.

Councillor Woolley,
Chairman of Health, Sewage Farm, and Lighting Committee, Ilkeston.

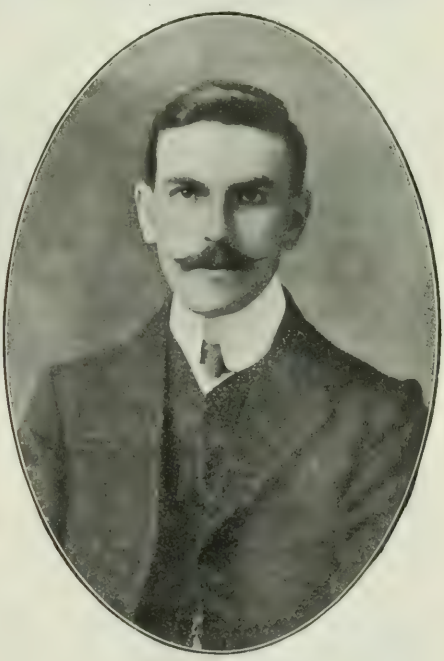
as an instance, a case which had occurred recently, the case of a borough engineer of his own county, an excellent man. Why he did not get a better appointment he did not know. This man had a salary under

months later, had now £20 a year to live upon. The Orphan Fund, he was glad to say, had been able to do its little to help in that case. They had several other cases, fortunately not so bad. He appealed to

Councillor W. Richards,
Chairman of Tramways and Electricity Committee, Ilkeston.

Mr. Sidney F. James,
Town Clerk of Ilkeston.

Mr. H. J. Kilford,
Borough Surveyor and Water Engineer, Ilkeston.



Mr. H. P. Stokes,
Borough Electrical Engineer and Tramways Manager, Ilkeston.

£200 a year, and a family of eight. He was taken suddenly ill, and his council gave him £10 to go on a fortnight's holiday, but at the station he died suddenly. His widow, who gave birth to a child two

the members—the young members especially. His friend Mr. Hooley had told him there had been a splendid response so far to the appeal for this fund, but he (the president) did not see why every single

member of the institution should not do something—however small—for the assistance of those who could not help themselves.

Mr. E. G. Mawbey (Leicester) then took the chair, and the election of the executive committee for the district—which comprises the counties of Derby, Leicester, Lincoln, Nottingham, and Rutland—was proceeded with. Twelve members in addition to Mr. Mawbey, the chairman, Mr. E. Purnell Hooley (Nottingham), representative on the council, and Mr. R. A. MacBrair (Lincoln), district secretary, were finally chosen to serve on the committee, their names being as follows: Nottinghamshire—Messrs. J. C. Haller (Carlton), urban district councils; T. Henry (Retford), rural, and T. W. Gordon (Nottingham), associate members. Leicestershire — Messrs. A. H. Walker (Loughborough), urban; S. Turner (Ashby-de-la-Zouch), rural; W. J. Court (Leicester), assistants. Lincolnshire—H. G. Whyatt (Grimsby), urban; W. B. Purser (Kesteven), county; T. Lake (Bourne), rural. Derbyshire—J. W. Horton, county, C. A. Clews, boroughs, F. W. Wright, associate members.

The consideration of the papers was afterwards proceeded with.

WATER SUPPLY, ILKESTON.

By Henry J. Kilford,

Borough Surveyor and Water Engineer.

Ilkeston is an old market town situate midway (about 8 miles) between Nottingham and Derby. The population in 1831 was 4,446; in 1881, 14,199; and in 1911, 31,673. The town in point of population was, until Chesterfield recently extended its boundaries, the second in the county of Derby. The charter for the market was granted to Hugh Fitz-Ralph by King Henry, 1251. The chief industries are coal, iron, lace and hosiery. The rateable value in 1884 was £44,728 5s. 6d.; in 1912, £88,329 10s.

WATER SUPPLY.

In 1884, when the writer commenced his duties, the water supply was a falling one, and was obtained from three sources—*viz.* (1) Queen-street, (2) Little Hallam, (3) Heanor-road.

(1) The Queen-street pumping station, situate in the centre of the town, was established by the late Ilkeston Waterworks Company, Limited, in 1855. The pump well was 46 yds. deep, the yield originally 10,000 gallons of water per day. In 1884, the horizontal H.P. engine and pumps were capable of delivering in one and a-half hours all the water the well could yield in twenty-four hours. This plant was set down in 1886, and removed later, but buildings are still in existence and are used as stores. The water was pumped into an open storage reservoir, with a capacity of 76,000 gallons, at the rear of the town hall.

(2) The Little Hallam pumping station is situate inside and near the south-west boundary of the borough. In 1871-72 the waterworks company extended their works by forming two open storage reservoirs, about 2½ acres, with a storage capacity of about 2,500,000 gallons. The water for the supply of these reservoirs was derived from three sources—*viz.*, the Oakwell spring, the Stanley brook, and the Nutbrook. These brooks drain a watershed of about 7,000 acres: both brook sources were decidedly objectionable and polluted with sewage. The plant consisted of a non-condensing high-pressure beam engine, 18-in. cylinder by 2½-ft. stroke, connected to an 8-in. double-acting pump. Water was delivered to the above-mentioned reservoir at the rear of the town hall through 1 mile of 7-in. mains. Steam was raised in a Lancashire boiler, 18 ft. by 6 ft. diameter.

These pumping plants (1) and (2), with engineman's cottage, land and water mains, were purchased from the waterworks company by the local board in 1878. The local board immediately added two sand filters, having a sand surface of 526 sq. yds.

(3) The Heanor-road pumping station is situate at the north end of the borough, and was established by the local board in 1878-79. The works adjoined a colliery, and comprised a shaft sunk about 80 yds. deep into the coal measures, a water lodge in the coal seam, deep-well pumps, high-pressure non-condensing horizontal pumping engine, one 30-ft. by 8-ft. Lancashire boiler, engine-house, and cottage. The yield of the well was about 80,000 gallons per day. A covered storage reservoir, with a capacity for 250,000 gallons, was erected at the same time at Shipley, just outside the borough, at an elevation of 382 ft. (top-water level) above ordnance datum, giving a head of 50 ft. in the market place. At a later date two sand filters were added. The plant was a modern one, but the quantity and quality of the water left much to be desired. This plant was abandoned in 1891; the water supply failed owing to colliery workings at a lower level.

In October, 1884, the Shipley reservoir was in a leaky condition, on account of mining operations, and the reservoir at Little Hallam empty. Steps were hurriedly taken to augment the supply, and within a week from the author's report to the board a disused colliery, noted for its water supply, quantity and quality (?), situate just outside the borough at Kirk Hallam, near the Little Hallam pumping station, was leased from Colonel Newdigate, the owner of the freehold, and the old plant, consisting of an 18-in. single-cylinder winding engine, a small horizontal pumping engine connected to deep well pumps by rods and quadrants, three old egg-end boilers, buildings, and sundry other apparatus appertaining to a colliery, were purchased. These were all in a deplorable state, having been set down several years, but in spite of it all, and the innumerable and almost insurmountable difficulties, water was being wound in barrels from the shaft and delivered through a new 6-in. main into the filters at Little Hallam in the time mentioned, and proved a great

boon to the town for many years. The lease was for forty years and the rent £50 per annum; this includes a house which is let at £20. The yield of this source of supply was well maintained at 240,000 to 280,000 gallons per day. Gradually the old colliery plant was either put in good condition or scrapped.

Subsequently a Davy pumping engine, 45-in. steam cylinder by 8-ft. stroke, was erected over No. 1 shaft, and a new 18-in. bucket and plunger pump, 86 yds. deep, fixed in the shaft, the pump rods being connected direct on the piston rod. This pump would deal with the water in eight hours and deliver it through a 12-in. main into the filters at Little Hallam. A steam capstan engine was fixed near the No. 1 shaft capable of lifting 20 tons. The double set of pumps left in the No. 2 shaft used by the colliery company were of the ordinary deep-well old-fashioned bucket type delivering into a "launder" about 3 yds. below the surface; these were altered so as to lift the water into the Little Hallam filters. Two 30-ft. Lancashire boilers provided steam for all purposes. The new buildings for Davy engine, capstan and boilers were of a substantial character The whole was abandoned in 1904 (when the Meerbrook Sough scheme came into operation) and the pumps subsequently removed from the shafts under great difficulties, but with success. It is not often experienced that an engineer has the removal of plant of this nature he designed and put down. The author could write a book upon the troubles and worries consequent on converting a disused colliery plant into a town's water-supply plant.

At Little Hallam a new engine-house was built, and a Worthington compound duplex jet condensing pumping engine by James Simpson erected therein capable of lifting 30,000 gallons of water per hour against a head of 300 ft. The water was pumped direct into a 12-in. supply main which was laid in from Little Hallam through the town to Heanor-road, the surplus or unconsumed water being delivered into the Shipley reservoir, from which the town was supplied by gravitation when pumps were standing. This arrangement of pumping was a great success, providing an adequate supply at a pressure of 100 ft. in the market place, the highest point in the borough, 332 ft. above ordnance datum. This pressure could be increased when required for fire brigade purposes. The engine was under perfect automatic control, and never at any time gave trouble under the varying conditions.

Later, another temporary engine-house and pump well was built, and another Worthington compound duplex surface condensing pumping engine installed, capable of delivering 60,000 gallons per hour against a head of 300 ft. through the same main. The quality of the water was not all that could be desired. Typhoid fever was prevalent, and this was traced to the water from the Nutbrook and Stanley Brook. The sand filters did not purify the water sufficiently, and the quantity required could not be passed through them; consequently two Reeves' patent pressure filters were put down. The water was forced by the pumps through these with excellent results, and the complete stamping out of typhoid.

University of Birmingham,
November 9, 1900.

ILKESTON WATER.

DEAR SIR—I have now completed my examination of this water. It has taken longer than usual on account of the difficulty experienced in correctly identifying one of the organisms isolated from the water. It presented many of the characters of the Bacillus Sporogenes Enteritides (the cause of certain diarrhœa epidemics); and it was only after a continued and prolonged examination that we were able ultimately to decide that it was not this germ. We had less difficulty in the case of the typhoid bacillus and the bacillus coli. They are not present in the water. There is no indication whatever of any contamination with human excremental matter.

The estimation of the total number of germs present in the water is surprisingly low, considering the possibilities of pollution in the area from which the water is drawn. It gives 150 germs in 1 c.c., which speaks well for the efficiency of the filtration. This is the average of three separate and careful examinations.—Yours truly,

R. F. C. LEITH,
Professor.

H. J. Kilford, Esq.,
Borough Surveyor.
Ilkeston.

The serious pollution of the brooks, the increasing population and consequent demand for water, compelled the committee to look round for another source of supply. The author explored the district for miles, and later, in 1891-2, in conjunction with Mr. I. Hodges, mining engineer, prepared an exhaustive report upon the water in the district. There were many places where the quantity required might have been obtained, but liable to be lost at any time, and to contamination by mining operations. This area was subsequently examined and reported upon by Mr. Hodson and Dr. Barwise with the same result—that all the waters were unsatisfactory, and could not be relied upon for a public water supply.

ILKESTON POLICE STATION

CEMETERY CHAPELS, ILKESTON.

BORING FOR WATER.

In 1893-5 the writer, with Mr. Ashworth, mining engineer, and Mr. Fletcher, F.R.G.S., examined the district for many miles on the west side of the borough, with the ultimate result of recommending the putting down of a borehole at Little Hallam. The boring was commenced in February, 1896. The first portion was "jumped," and the lower portions cut through with the "diamond drill." Specimens of the cores may be seen in a case at the free library. Some of these cores in the grit came out 6 ft. long. Water was struck at 837 ft., and rose in a tube 14 ft. above the surface. The quantity overflowing at the surface was 180 gallons per hour. The boring was continued down to 1,802 ft., but as far as could be ascertained no additional supply was struck. A shaft well was sunk and bricked to a depth of 125 yds. During the sinking the borehole tubes were removed, and at a depth of 53 yds. salt water was met with; upon replacing the tubes

the water issued at a higher level free from salt, perfectly bright, clear and palatable. The source of the salt water was not ascertained. It is a coincidence that it was found practically at sea level. The maximum yield of the borehole and shaft was 300,000 gallons per day. The town council called in Mr. Hodson, of Loughborough, and upon his advice the boring was abandoned. The cost of the boring was £1,615; the first 50 yds. 25s. 9d., increasing 5s. per yard each 50 yds. in depth; the last 50 yds., 87s. per yard.

The sinking of the shaft by direct labour to 125 yds. proved a difficult undertaking, the strata passed through was full of water, which was pumped by two of "Evans'" sinking pumps with sliding suctions; these were hung in slings, and lowered as the work proceeded. Trouble was experienced with clacks, valves and their seatings, until the writer altered the method of securing them, after which the trouble ceased. The temperature (120 deg.) caused by two steam and two exhaust pipes (although these were covered with felt) was very oppressive and trying, and it was a relief to drop into the cold water in the shaft bottom. One fitter sent down to do some repairs refused to work under £5 per hour. The shaft was 10 ft. in diameter, brick lined in cement mortar with oak curbs. It would have been much more convenient if this had been 12 ft., and the shaft sunk clear of the borehole.

The cost of pumping at Little Hallam, including coal, oil, lubricating labour, gas, rents, rates, &c., was 2¾d. per 1,000 gallons against a head of 350 ft. The cost of distribution, including repairs and renewals, services and inspectors, ¾d. per 1,000 gallons, making the total 3½d. per 1,000 gallons. There are 27 miles of water mains within the borough, ranging from 3 in. to 12 in. Some of the mains are much corroded, and will require new ones of greater diameter at an early date. Valves are placed so as to control each street and branch, and spindle hydrants, about 80 yds. apart, so that ample provision is made for the fire brigade. Trouble has been caused by excessive quantities of lime passing from the works into the reservoirs and pipes, Ilkeston suffering most in this respect. It is not so marked now, still, a small quantity is found in the reservoir at Shipley, hydrants in the town, and pipes of consumers. This lime deposit has, in some instances, completely choked up the iron hot water pipes in houses, but it has no effect upon lead pipes used for this purpose.

MEERBROOK SOUGH.

In 1899 the author, and again in 1901 with Mr. John Holbrook, surveyor of Heanor, visited the Wirksworth district and made exhaustive inquiries as to the source of the water issuing from the Meerbrook Sough, and the possibility of pollution and contamination from the Wirksworth sewage and lead mines. Gaugings of the water were made at the mouth of the sough, and the quantity was found to be about 16,000,000 gallons per day. A report was submitted to the council, with sketch plans of proposed route, site for reservoirs, &c., and the cost of the scheme was estimated at £86,000. The estimate of the cost practically held up the scheme for a long time until Mr. Hodson was consulted, when he strongly recommended the Meerbrook scheme, with the result that the Ilkeston and Heanor Water Board was formed, and an Act of Parliament obtained in 1901. The works, as now completed, comprise the pumping station at Whatstandwell, a little north of the sough mouth. Here a noble building has been erected to contain the three compound condensing pumping engines (each capable of lifting 50,000 gallons per hour against a head of 500 ft. through 2¼ miles of 18-in. pipes into the covered storage reservoir at Chadwick Nick), three 30 ft. by 8 ft. steel Lancashire boilers, Green's economisers, coal stores, fitters' shop, turbine-house, centrifugal and electric light plant room, &c. The softening plant—Archbutt-Daley process by Mather & Platt—is under a separate roof; two dwelling-houses, gardens, railway sidings, and spent lime, storage beds, &c. The water from the sough is diverted through a turbine, which raises part of the water required; the remainder is pumped up by centrifugal pumps into a large iron tank forming the roof of part of the buildings, from which it passes on to the softening plant. The water is here reduced from 22 deg. to 8 deg. of hardness. Thence it passes into the pure water tanks under the softeners, from which the pumps take their supply.

The works are beautifully situated by the side of the river Derwent, close to the main road from Derby to Matlock, and are well worth a visit by any who may be interested in the lifting, and treatment by softening, of water for a town's supply.

The storage reservoir at Chadwick Nick has a capacity of 1,000,000 gallons, and is at an elevation of 700 ft. (top of water) above ordnance datum. The water gravitates through 16-in., 15-in. and 14-in. pipes to Codnor Park and Tag Hill reservoirs for Heanor, and to the Shipley reservoir for Ilkeston. The water is supplied by meter into the several reservoirs, and the cost of the works to this point is borne by each constituent authority according to the quantity taken.

Difficulties have been experienced by leakage from

ILKESTON AND HEANOR WATER SUPPLY.

the mains. The following figures are taken from the engineer's reports:—

Sept., 1906	...	...	1,870,000 gallons
Oct.	,,	...	3,370,000 ,,
Nov.	,,	...	6,141,000 ,,
Dec.	,,	...	13,098,000 ,,
Jan., 1907	...	...	33,775,000 ,,

In February, 1907, the writer examined and tested the mains for the board, and found that the bulk of the leakage was from the 2¼ miles 18-in. pumping main. This was a terrible loss, necessitating practically day and night pumping. The joints of the pipes were found defective; these have been made good, and the leakage is now practically nil between the pumps and Chadwick Nick reservoir. The leakage upon the whole of the mains has been reduced to about 25,000 gallons per day.

The undertaking involved a capital expenditure of £120,000. The cost of the water to the two authorities is about 6d. per 1,000 gallons.

The Ilkeston storage reservoir at Shipley is built upon land under which coal has recently been worked. Upon examination this month it was found that fractures had occurred in many places in the floor, walls and vaulting. Upon testing for leakage it was found to be practically watertight, thanks to clay puddle. The ascertained leakage being equal to a drop in surface level of 0·08 (340 gallons) in twenty-four hours, another test was interesting, as rain was falling the whole time, and the surface of the water rose slightly, the rain must have percolated through the roof cracks. Care was taken that no water was leaking in through the valves.

The water pressure in the highest part of the borough (the Market-place, 332 ft. above ordnance datum) is inadequate, and must be increased. The author has designed a water tower with small tank, at an increased elevation of 50 ft. above the water level in the storage reservoir, in which to place valves, &c., and to break the Chadwick Nick pressure, and to give a head of 80 ft. in the Market-place. Experiments are being made, but not quite completed, to pass the water through a pressure-reducing valve; if successful the tower will not be built: but the author is certainly of opinion that the tower, though more costly, would, in the end, be the most satisfactory.

The author is considering the question of utilising the waste or lost pressure and energy, the drop between Chadwick Nick pressure and the reservoir (which is equal to 700,000 gallons of water falling 240 ft. every twenty-four hours), for generating electricity; the problem is a difficult one, as the conditions are peculiar, and the consumption of the water varies from 10,000 gallons per hour to 50,000; it is also imperative that the pressure on the outlet or exhaust side of the turbine, or other hydraulic engine, be maintained constantly at about 70 ft. The quantity of water supplied daily is 700,000 gallons, equal to 22 gallons per head for all purposes. Deducting the water passed through the meters, it gives a nett consumption for domestic purposes only of 16·5 per head. There are ninety-four meters of different makes in use, with a daily consumption varying from 50,000 downwards. The average daily consumption by meter equals 5½ gallons per head of the population. The water is of excellent quality. Dr. Barwise has frequently analysed it, and one of his reports reads as follows:—

Ilkeston and Heanor Water Supply.

On January 10th this year I collected a sample of the Meerbrook Sough water before and after softening, and have submitted the same to a complete bacteriological examination. Your Committee will remember that at the time of the promotion of the Ilkeston and Heanor Water Bill it was suggested that sewage from Wirksworth occasionally found its way into this water after heavy rains. I selected January 10th because there had recently been a thaw, and the Sough water had not the brilliant transparency which it usually has. The bacteriological results of the water before treatment confirmed the results previously obtained, and indicate that it is a pure supply. The water after treatment is exceptional, and I doubt whether there is another supply in the country of equal volume of the same purity.

The results show that there is not a single organism of either suspicious or innocent nature growing therein. The attention of the Heanor District Council and the Corporation of Ilkeston should be called to these results, and it might be pointed out that they have an opportunity of starting a fresh industry, as the supply is admirably suited for the manufacture of high-class *aerated waters*.

Sidney Barwise.

The total indebtedness upon the water undertaking is £56,411 3s 8d. The income last year was £7,693, the outgoings £8,153, showing a loss of £460, which is equal to a 1½d. rate.

The writer apologises for the crudeness of his paper; his intention was, when commencing to write, to embrace and describe briefly, with cost, &c., the whole of the works appertaining to his many departments, but, owing to lack of time and unforeseen circumstances, has been compelled to alter the heading and to confine his remarks to the water department only.

ILKESTON TRAMWAYS AND ELECTRICITY SUPPLY.

By Harry P. Stokes,
Engineer and Manager.

In dealing with the electricity supply and tramway system of the Ilkeston Corporation, you will, of course, understand that having only occupied the position of borough electrical engineer and tramways manager for a period of three years, certain information with respect to the concern has been obtained from more or less indirect sources. Early in March, 1898, a company at Nottingham approached the corporation with a scheme for putting into operation a system of cable cars, but the corporation came to the conclusion that if a private company could see any good was likely to result from the operation of a system of cars in a town the size of Ilkeston, whatever benefits were to be obtained might as well be had by the municipality first hand. Steps were, therefore, taken to construct an electric tramway system, and a Provisional Order was obtained from the Board of Trade. Mr. V. B. D. Cooper, of London, was appointed consulting engineer, and submitted plans and estimates for the scheme, which were adopted by the council. About the same time the Nottingham and Derbyshire Power Company proposed to erect a number of generating stations for the supply of electricity in the counties of Nottinghamshire and Derbyshire, and as the price they offered to the borough for the supply both for light and power purposes was considered a reasonable one, the council abandoned their own scheme so far as generating electricity was concerned, and decided to purchase in bulk from the power company. The contract for laying the lines, erecting overhead equipment, and supplying cars was let to Messrs. Dick, Kerr & Co., of Preston; and that for the car sheds and offices to Messrs. Moss & Sons, of Loughborough; and that for cables for electric supply to Messrs. Callender & Co. Considerable delays were experienced after the tramways were ready for operation in obtaining the necessary supply of electricity from the power company, and it was not until May 1, 1903, that the first car was able to commence running. The system was passed by the Board of Trade on Friday, May 15, 1903. The tramway track is 3-ft. 6-in. gauge, and the district being a colliery one, considerable trouble has been experienced throughout its life with respect to maintenance.

There is no doubt that the original work was not as satisfactorily carried out as one could have expected, and unfortunately, what is known as "Dicker" rail joints were adopted, and these not having been well fitted in the first instance, continual trouble with rail joints has been the result. Extensive reconstruction of the bed has had to be carried out during recent years; in fact, practically the whole of the track has now been gone over. We are gradually introducing new rail joints throughout the system. These are known as the "Atlas" joints, and have a web on the fish plates which extends right under the bottom flange of the rail, the two fish plates meeting one another, and being secured, in addition to the ordinary fish-plate bolts, by means of two special truss bolts underneath the bottom flange. Only a few of these have been installed up to the present, but the work is being proceeded with as rapidly as possible, and their success is already well assured.

The overhead, when first erected, was of 0 trolley wire, with only single insulation; as a result, continual breakages were occurring, and some new wire was put up after only four years' operation. Unfortunately 00000 and 0000 wires were used on separate occasions, thereby adding to the difficulties of maintenance. During the last three years the whole of the overhead has been reconstructed, double insulation having been provided, and 000 non-fouling wire fitted with mechanical ears. The car sheds are situate in Park-road, and have a handsome frontage; the shed has accommodation for fifteen cars, but, unfortunately, was somewhat badly arranged for deal-

ing with repairs, and no paint shop has been provided. Additional machines and tools have recently been installed, and the whole of the repairs are now carried out on the premises. The depot is now supplied with a large lathe for wheel boring and turning and heavy work, another lathe for armature turning and binding, and a small lathe for the lighter class of work, a vertical drilling machine, Stirling hacksaw machine, emery grinder, wheel press, forge, &c. Nine of the cars are Dick, Kerr equipment throughout, the other four are Milnes Voss bodies, fitted with Westinghouse equipment.

While referring to cars, it may be of interest to note that we have had considerable trouble with rotten timber in the roofs, and are now adopting a new method of roof construction. Originally, the plank to which the trolley standard was bolted was simply screwed down to the ends of the cars, and the strain which occurs to the tops of the cars through the weight of the platform caused the top deck roofing to buckle, and eventually let the water into the roof, with disastrous results. We are now using only solid oak planks, and these are armoured with 2-in. by ⅝-in. iron running the whole length, rabbeted and screwed into the plank; angle irons are run from the car body principals across the ends of the cars, and to these the trolley plank is bolted through the iron straps, the trolley standard itself being bolted through the plank and iron straps to the base plate below. A side fillet is run all the way round the car of solid oak 4½ in. by 2 in., and a double floor is constructed of ⅝-in. red deal, 3 in. wide, with plain rabbet on either side, the second floor overlapping the seams of the first; the two floors are screwed together with a layer of lead between to make the whole roof waterproof. Wrought-iron tread strips are being adopted in place of the wooden laths, and by this means we hope to prevent the damp getting into the timbers.

When the tramway system was put into operation a universal 1d. fare was adopted, and a continual loss has always occurred on the working of the system, varying from £1,800 to £3,200 per annum; but in April last, after the conclusion of the coal strike, the council approved of a new system of fares, comprising a 1½d. through fare, with 1d. intermediate stages, and this new system is already helping to bring about an increase in the receipts. The operating costs of the tramways in the first two years of working were nearly 8d. per car-mile, and three years ago they amounted to 6·85d. per car-mile; last year they were 6·02d. per car-mile, notwithstanding the heavy renewals which have been carried out, and when it is taken into consideration that on a small system the size of Ilkeston there is a certain limit below which it is impossible to go with regard to staff, you will find that our operating costs compare very favourably with those systems of a similar size.

In connection with the electricity supply, the system is known as the three-wire solid system, bitumen cables being laid in troughs, and filled in solid with bitumen. The supply is direct current, 460-volt and 230-volt. Recently additional isolation boxes and feeder pillars have been introduced to facilitate dividing up the system into smaller sections for locating faults, and serious troubles have been avoided.

The distribution originally all took place from the car depot, a pair of heavy feeders running from there to Station-road, and distributing solely from that point. We now have three separate feeders from the power company, and eight separate feeders of our own. The switchboard and balancers adjoin the tramway depot in Park-road, but considerable alterations and improvements have been made within recent years, and a sub-station equipped to deal with the load at the lower end of the town.

Our charges for electricity supply are among the lowest in the country, and the department two years ago made a profit for the first time, but this profit is an increasing one. Very little attention had been given to electricity supply for power purposes; in fact, electrical driving had been discountenanced as much as possible, but we are now making good progress in this direction. In 1909 only 14-horse power in motors were connected to the mains; we now have just over 100-horse power connected. The electrical plant at the new sewage disposal works was installed by this department, and another interesting installation has just been completed in one of the lace factories, where steam had to be competed with. The motor has been especially built for the work, also the automatic starting apparatus, and chain driving is used instead of belt. The result has been a complete victory for electricity, notwithstanding the intense prejudice which had to be overcome. The units purchased for lighting in 1909 were 283,000, and last year they were 352,000. The losses in distribution in 1909 were 16 per cent, and in 1912, 3·9 per cent. Considerably more progress would have been made in this department but for the fact that our capital account was exhausted, and no new borrowing powers having been obtained, all new extensions to mains have had to be provided out of revenue, thus considerably handicapping the progress of this department.

The question as to the advisability of introducing a tramway system into a town the size of Ilkeston, is, of course, a question of the past, and the only thing to be done now is to obtain more patronage for the cars, and keep the working expenses down to a minimum, yet at the same time it is no use shirking the responsibility of maintaining the concern in a high state of efficiency. The amount of money spent on repairs and maintenance on the permanent way during the first seven years of working only worked out at about ½ per cent, while the overhead equipment (due to continually repairing a small section of wire) worked out at nearly 7½ per cent, and cars 10 per cent, per annum on the original costs. Had a larger sum been spent on the maintenance of the permanent way, which is the most vital part of the system, there is no doubt that a great proportion of the heavy items of expenditure which have been incurred during recent years would have been eliminated. The car depot and works are conveniently situated for any member desirous of inspecting same, and any point of interest will be thoroughly explained. In conclusion, the writer must apologise for the inefficiencies of the paper, but trusts that the visit to the town will be an interesting and helpful one.

(To be concluded.)

The paper by Mr. H. P. Raikes, describing the recently completed sewage works at Ilkeston, is reproduced elsewhere in this issue.

The Port of London.—Tenders amounting to £2,350,000 have been accepted by the Port of London authority for dock extension and improvements which cover the more important works immediately contemplated. These works form the first portion of the extensive proposals submitted by Lord Devonport in January, 1911. The complete scheme then outlined would involve a total expenditure of over £14,000,000.

Wandsworth Bridge.—A joint deputation of Fulham, Battersea, and Wandsworth Borough Councils is being arranged to urge upon the London County Council the desirability of erecting a new bridge in place of the present Wandsworth Bridge. "We are of opinion," states a report of the Battersea Highways Committee, "that the provision of a better bridge between the Putney and Battersea bridges would be a distinct benefit, inasmuch as we understand that heavy traffic, such as motor 'buses, is barred from using the present bridge."

Problems in Engineering with Solutions.*—The English journal The Surveyor and Municipal and County Engineer carries on a section devoted to various questions which might be put in an examination for the position of municipal engineer in an English town or city. The questions are given one week and answers provided by various correspondents given in subsequent issues. The volume noted above is the first one to be made up from these questions and answers. As is well known, the position of municipal engineer in England is one of most varied activity, so that the subject covered by the questions and answers extends through the whole field of engineering. For example, the chapter headings are as follows: Mechanics and Hydrostatics; Strength and Elasticity of Materials; Theory of Structures; Surveying and Levelling; Water Supply and Hydraulics; Sewerage; Sewage Disposal; Road Making and Tramways; Building Construction and Materials; Law and Miscellaneous. While the questions and most of their solutions are distinctly British in character, the wide range of subjects and the method of treatment make the book of some value to American engineers. There is a good deal to be said in favour of the question and answer method of instruction.—*Engineering News.*

* Being Questions and Answers reprinted from the Assistants' and Students' Section of The Surveyor and Municipal and County Engineer. First Series, 1909-10. Edited by Sydney G. Turner, assoc.m. inst.c.e. London: St. Bride's Press, Limited. Price 5s. nett.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

NORTH WALES DISTRICT MEETING.

A North Wales District meeting is to be held at Wrexham on Saturday, October 19th.

Thomas Cole,
11 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

President-Elect—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

NORTH-WESTERN DISTRICT.

At a meeting of the North-Western District of the Institution of Municipal Engineers, held in Manchester on September 25th, there were present Messrs. A. R. Bleazard (Clitheroe), W. Briggs (Stockport), A. Dempsey (Eccles), A. Foster (Salford), K. Grimshaw (Stockport), S. M. Hindle (Chadderton), G. H. Hopkinson (Chorley), J. H. Marsh (Worsley), J. W. Sunderland (Norden), E. Walker (Stretford) and J. W. Gleave (Heywood).

The chairman, Mr. Bleazard, in opening the new session, thanked the members for electing him to the position, and urged individual members to use their best efforts and to all pull together for the benefit of the institution.

It was urged that North Wales and the West Riding of Yorkshire should be added to the present North-Western District.

Proposals to make up a party to attend the annual meeting in London on October 11th and 12th were considered, and it was decided that if members in this district would write to the hon. secretary, Mr. J. W. Gleave, at once, he would try to make satisfactory train arrangements.

A small sub-committee was appointed to make arrangements for a "social," which it is proposed to hold on December 7th; further information on the matter will be sent to the members in due course.

Mr. Bleazard reported the offer of a visit to Southport from the borough surveyor, Mr. Jackson, which was unanimously accepted. The date proposed is the second Saturday in October.

The next meeting in Manchester is fixed for November 18th, when a general discussion on the "Merits of the Intercepting Trap" will take place, and the sub-committee's proposals *re* "social" will be dealt with.

Mr. Bleazard's paper on "Municipal Progress in Clitheroe" being taken as read, there was a general discussion on matters contained therein. The items raised included charges made for connecting waste-water closets to sewers, local authorities' grants when converting pails, &c., to the water-carriage system; the flushing of sewers; intercepting traps choked with their own raking-eye stoppers; charges for fire-brigade services, &c.

Mr. Foster raised the question of exemptions under the National Insurance Act, and the following resolution was passed:—

"That this meeting of the North-Western District of the Institution of Municipal Engineers recommends the council of this institution to consider the question of National Insurance, and to draw up a scheme to secure the exemption of municipal engineers affected by the Act?

ANNUAL GENERAL MEETING.

The fourth annual general meeting of the Institution of Municipal Engineers will be held in London on Friday and Saturday, October 11th and 12th.

Programme.

Friday, October 11th.

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.

11.15 a.m.—Annual general meeting:—
Minutes of last meeting.
Election of council for the year 1912-13.
Presentation of annual report of council.
Announcement of result of ballot.
Presidential address.

1 p.m.—Adjourn for lunch.

2 p.m.—Reassemble in council chamber.

2.15 p.m.—Discussion on the following papers to be presented to the meeting:—
"The Modernising of Building By-laws," by F. W. Platt (member).
"The L.G.B. Report on Intercepting Traps," by H. C. H. Shenton (member).
"The Influence of Town Planning upon the Public Health," by W. Louis Carr (member).
"Superannuation and Security of Tenure," by A. Winter Gray (Member).

(The papers will be taken as read, and advance copies may be obtained on application to the secretary, and will be forwarded as soon as the papers are in print.)

5 p.m.—Close of meeting. Ladies return to council chamber.

Ladies' Meeting.

(Held concurrently with General Meeting.)

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.

11.15 a.m.—Leave council chamber and proceed to the stores of Messrs. Selfridge & Co., Oxford-street, W.

11.30 a.m.—Meet at the Duke-street entrance of the stores, where visitors will be met by a representative of the firm and conducted round the building.

1 p.m.—Lunch.

2.30 p.m.—Meet at the showrooms of Messrs. Doulton & Co., Limited, Lambeth, S.E., who have kindly arranged to conduct the visitors through their works and showrooms.

4.30 p.m.—Leave Messrs. Doulton's works.

5 p.m.—Arrive at council chamber, Southampton-row.

6.45 p.m.—Reception by the president at the Holborn Restaurant, followed by (7 p.m. to 11.30 p.m.) social evening, with musical programme, at the invitation of the president. Morning dress.

Saturday, October 12th.

10.30 a.m.—Visit to Shakespeare's England, Earl's Court. Meet in booking hall, Earl's Court Station.

12.30 p.m.—Adjourn for lunch.

2.30 p.m.—Visit to the London Hippodrome, at the request of a number of country members.

EASTERN DISTRICT MEETING, CODMANCHESTER.

(Tuesday, October 15th.)

Programme.

11.30 a.m.—Meet at Godmanchester Station and inspect Roemac road.

12.30 p.m.—Call at council's depot, where methods of sewer flushing will be shown.
Inspect reinforced concrete bridges.

1 p.m.—Lunch at the Horseshoe Temperance Hotel.

2 p.m.—Reception at the town hall by his Worship the Mayor (Mr. J. P. L. Durrell Stables, J.P.).
Inspect old charters, books and records.

3 p.m.—Walk round town, viewing sixteenth century architecture, tarviated roads, reinforced concrete posts, new system of constructing cheap cottages and "exhibition" of cheap cottages.

4 p.m.—Tea at the Horseshoe Temperance Hotel.

Philip S. Bennett,
Council Offices, *Hon. District Secretary.*
Ramsey, Hunts.

JOINT MEETING OF YORKS AND NORTHERN DISTRICTS.

A joint meeting of the Yorks and Northern districts will be held at Harrogate on Saturday, October 19th.

Programme.

Meet at Harrogate station.

Drive by motor char-a-banc to corporation depot to inspect new tar-macadam mixing plant and stone-breaking machine in operation.

Light refreshments.

Drive to north sewage outfall works; new aërating sprinklers and special apparatus for treatment of sludge; Royal Baths (there are eighty-six different treatments, the principal ones of which will be explained and viewed); Iron Gate reservoir; sand bed filters; Harlow Hill reservoir; Candy-Whitaker's

mechanical filters; corporation stables and town's yard; corporation fire brigade station; new Merryweather motor fire engine.

Dinner at North-Eastern Hotel.

A short meeting of Yorkshire members will be held to discuss rearrangement of district.

H. J. Firth.
Hon. District Secretary, Yorkshire District.

John Robinson.
Hon. District Secretary, Northern District.

October 2, 1912.

Subscriptions, 1912-13.—Members and others are requested to note that annual subscriptions for 1912-13 are now due.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, LEWES.

At a meeting of the Royal Sanitary Institute, to be held at the Town Hall, Lewes, to-day (Friday), at 7 p.m., Mr. D. Roberts, the borough surveyor of that town, will open a discussion on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams," among those who are expected to take part in the proceedings being Messrs. John H. Blizard, assoc.m.inst.c.e., Southampton, A. J. Martin, m.inst.c.e., Westminster, and A. E. Prescott, borough engineer and surveyor, Eastbourne.

The chair will be taken by Mr. H. Percy Boulnois, m.inst.c.e., chairman of council of the institute.

To-morrow morning the members will visit the Phœnix Ironworks and the Lewes Portland Cement and Lime works, and in the afternoon inspect the Lewes Victoria Hospital, the borough isolation hospital, the fire brigade station, and the waterworks.

NEXT YEAR'S CONGRESS.

The council of the Royal Sanitary Institute have accepted an invitation from the City Council of Exeter to hold the next congress and exhibition of the institute in Exeter, from July 7 to 12, 1913.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers to be held on Monday next at the Institution of Electrical Engineers, Victoria Embankment, W.C. (south end of Savoy-street, near Waterloo Bridge), a paper on "Town Planning from an Engineering Aspect" will be read by Mr. E. R. Matthews, assoc.m.inst.c.e., f.g.s., the following being a synopsis: Town planning in a residential area—Direction, width and construction of main arterial, secondary and subsidiary streets—Building line in such streets—Sites for public buildings, &c.—Open spaces for recreation grounds and parks—Sewerage and sewage disposal—Water supply and lighting—Widening of existing roads—Bridlington's town planning scheme. Town planning in an industrial area: Comparison between the planning of a residential and an industrial area, and a consideration of the various points which arise in planning an industrial area.

The chair will be taken at 7.30 p.m. precisely.

A. S. E. Ackermann,
Secretary.
17 Victoria-street, S.W.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference. *The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By Sydney G. Turner, of the Middle Temple, Barrister-at-Law, a.m.i.c.e., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but these responsible for their despatch are recommended to arrange that they shall reach* **The Surveyor** *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

CLERK OF WORKS.—October 5th.—Rivers Committee of the Manchester Corporation. £3 3s. per week.—Chairman of the Committee.

OUTDOOR ENGINEERING ASSISTANT.—October 5th.—Rivers Committee of the City of Manchester. £200 per annum.—Mr. Thomas Hudson, town clerk.

SANITARY INSPECTOR.—October 7th.—Corporation of Bournemouth. £100—£130.—Mr. H. Ashling, town clerk. Application to be endorsed "Sanitary Inspector."

CHIEF ENGINEER AND COUNTY SURVEYOR.—October 7th.—London County Council. £2,000.—Sir Laurence Gomme, clerk.

SURVEYOR.—October 8th.—Corporation of Nairn.—Mr. A. Storm, town clerk.

SURVEYOR'S ASSISTANT.—October 8th.—Shipley Urban District Council. £2 per week.—Mr. I. Lindon, clerk.

ENGINEER'S ASSISTANT.—October 8th.—Municipal Commissioners of Singapore. $350 (the dollar is valued at 2s. 4d.) per month.—Mr. C. C. Lindsay, 180 Hope-street, Glasgow.

SANITARY ENGINEER.—October 8th.—For service on the Gold Coast under Secretary of State for the Colonies. £500—£600 per annum, with £100 duty allowance.—Secretary of the Royal Sanitary Institute, 90 Buckingham Palace-road, S.W.

CLERKS OF WORKS (2).—October 9th.—Whaley Bridge Joint Sewerage Board. £3 and £2 10s. per week.—The Clerk.

ASSISTANT INSPECTOR OF NUISANCES.—October 9th.—Corporation of Coventry. £80—£110 per annum.—Mr. G. Sutton, town clerk.

HIGHWAYS SUPERINTENDENT.—October 9th.—Corporation of Huddersfield. £120 per annum.—Mr. K. F. Campbell, borough engineer and surveyor.

CLERK OF WORKS.—October 9th.—Broadstairs Urban District Council. £3 per week.—Mr. L. A. Skinner, clerk.

BUILDING INSPECTOR.—October 10th.—Corporation of Dewsbury. £100 per annum.—Mr. H. Ellis, town clerk.

HIGHWAY SURVEYOR.—October 14th.—Truro Rural District Council.—Mr. Coulter Hancock, solicitor.

GENERAL FOREMAN.—October 15th.—Whitefield Urban District Council. £2 per week.—Mr. Chas. Bradshaw, clerk. Applications to be endorsed "Foreman."

SECOND ASSISTANT.—October 15th.—Romford Rural District Council. £105—£120 per annum.—Mr. T. W. A. Greenhalgh, clerk. Applications to be endorsed "Surveyor's Assistant."

CLERKS OF WORKS (2).—October 16th.—Chapel-en-le-Frith Rural District Council. £2 10s. and £2 2s. per week.—Mr. J. B. Boycott, clerk, Union Offices.

SEWAGE WORKS MANAGER.—October 16th.—Padiham Urban District Council.—Mr. J. Gregson, surveyor.

DEPUTY CITY SURVEYOR.—October 19th.—Corporation of Manchester. £500 per annum.—Mr. Thos. Hudson, town clerk. Applications to be endorsed "Deputy City Surveyor."

INSPECTOR OF NUISANCES.—October 19th.—Patrington Rural District Council.—Mr. L. A. Milton, clerk.

COUNTY SURVEYOR.—October 19th.—County of the Soke of Peterborough. £200 per annum.—Mr. Walter J. Deacon, clerk, Cross-street, Peterborough. Applications to be endorsed "Application for County Surveyorship."

CHIEF ENGINEER.—October 28th.—Municipality of Karachi (India). 500—750 rupees per month.—Mr. Measham Lea, chief officer and chief engineer, Municipal Office, Karachi.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

LLANDUDNO.—October 31st.—Designs for laying out about 20 acres, for the urban district council. A premium of 50 guineas is offered.—Mr. A. Conolly, clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas.—Mr. J. Henry Field, town clerk.

ROSCREA.—November 1st.—Plans, specifications, and estimates of a complete sewerage scheme, for the No. 1 Rural Council.—Mr. Thomas Dooly, clerk, Roscrea Workhouse.

CARLISLE.—December 2nd.—School buildings, for the corporation. City Surveyor, 36 Fisher-street, Carlisle.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

Buildings.

DERWADE.—October 7th.—For the construction of a bridge, for the rural district council.—Mr. A. E. Scarlett, clerk, Pulham Workhouse, Harleston.

GLASGOW.—October 5th.—For the construction of a public convenience, for the corporation.—Mr. J. Lindsay, town clerk.

BIRKENHEAD.—October 7th.—For the construction of a gallery in the swimming bath, for the corporation.—Mr. J. Fearnley, town clerk.

DURHAM.—October 7th.—For the erection of a general bath-house at county asylum, for the county council.—Mr. W. Crozier, county surveyor and architect, Shire Hall, Durham.

SOUTHAMPTON.—October 7th.—For the reconstruction of Fore Bridge, for the corporation.—Mr. H. Barber, clerk, The Castle, Winchester.

ALTRINCHAM.—October 7th.—For the erection of a public convenience, for the Sanitary Committee.—Mr. H. E. Brown, surveyor.

ST. GERMANS.—October 9th.—For the erection of five cottages, for the rural district council.—Mr. F. E. Cleverton, clerk, 4 Buckland-terrace, Plymouth.

CROYDON.—October 11th.—For the erection of a workshop, for the corporation.—Mr. F. C. Lloyd, clerk.

HARROW.—October 12th.—For the construction of two conveniences, for the urban district council.—Mr. J. Strachan, clerk.

CORNWALL.—October 12th.—For additions to a school, for the Education Committee.—Mr. F. R. Pascoe, secretary, County Hall, Truro.

WEDNESBURY.—October 12th.—For the erection of a lodge and shed at cemetery, for the corporation.—Mr. T. Jones, town clerk.

SPALDING.—October 15th.—For building thirty-six cottages, for the urban district council.—Mr. H. H. Harvey, clerk.

WATFORD.—October 15th.—For the construction of a public convenience, for the urban district council.—Mr. D. Waterhouse, engineer and surveyor.

BRAY.—October 15th.—For the erection of sixty-four dwellings, for the urban district council.—Mr. P. MacDonnell, clerk.

BRISTOL.—October 16th.—For the erection of muniment rooms, for the corporation.—Mr. P. Addie, city valuer, The Exchange.

HERNE BAY.—October 16th.—For the erection of a pavilion and concert hall, for the urban district council.—Mr. G. H. Beetenson, clerk.

LANCS.—October 17th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, 16 Ribblesdale-place, Preston.

DORSET.—October 18th.—For the erection of an elementary school, for the county council.—Mr. Clement G. Bone, secretary, County Offices, Dorchester.

WEST RIDING.—October 18th.—For alterations to a school, for the county council.—The Clerk, County Hall, Wakefield.

SOUTH WESTMORLAND AND ULVERSTON.—October 19th.—For erecting a stone arch bridge, for the rural district council.—Mr. A. Milne, Lowther-street, Kendal.

PORTSMOUTH.—October 21st.—For the erection of a school, for the Education Committee.—Mr. G. Hammond Etherton, town clerk.

HENDON.—October 21st.—For the erection of fifty artisans' dwellings, for the urban district council.—Mr. H. Humphris, clerk.

HENDON.—October 21st.—For the erection of a fire station, for the urban district council.—Mr. H. Humphris, clerk.

Iron and Steel.

SWANSEA.—October 7th.—For supply of wrought-iron unclimbable fencing and gates, for the corporation.—Mr. H. Lang-Coath, town clerk.

WOMBWELL.—October 8th.—For the supply of 50 lin. yds. of 15-in. diameter cast-iron pipes, bank pipes, or steel tubes, for the urban district council.—Mr. P. M. Walker, clerk.

ROTHERHAM.—October 12th.—For excavating, laying, jointing, and filling in 21 miles of cast-iron spigot and socket pipes, the sizes ranging from 8 in. to 3 in., for the rural district council.—Messrs. Oxley and Coward, clerks.

ROTHERHAM.—October 12th.—For the supply of 1,330 tons of cast-iron spigot and socket pipes with special castings, for the rural district council.—Messrs. Oxley and Coward, clerks.

WARRINGTON.—October 14th.—For the supply of wrought-iron unclimbable hurdles and gates, for the corporation.—Borough Surveyor.

HELMSLEY.—For providing and laying 3 miles of 3-in. cast-iron water main and 3 miles of branches, with specials, valves, fittings, and hydrants, and the construction of ram-house and service reservoir, for the rural district council.—Mr. Robert Pearson, clerk.

Roads.

TEDDINGTON.—October 5th.—For making up three roads, for the urban district council.—Mr. G. H. Salmons, clerk.

WELLINGTON.—October 5th.—For the supply of tarred granite and tarred slag, for the urban district council.—Mr. J. W. Littlewood, clerk, Bank Chambers, Wellington, Salop.

HUYTON.—October 5th.—For the supply of macadam and granite chippings, for the urban district council.—Mr. G. W. Swift, clerk.

DONCASTER.—October 7th.—For making up certain streets, for the corporation.—Borough Surveyor.

WHITLEY AND MONKSEATON.—October 7th.—For the reconstruction of footways, for the urban district council.—Mr. Augustus Whitehorn, clerk.

CHESTER-LE-STREET.—October 7th.—For work of road improvement, for the rural district council.—Mr. R. V. Dickinson, clerk.

MORECAMBE.—October 7th.—For making up a thoroughfare, for the corporation.—Mr. J. W. Hipwood, borough surveyor.

EAST STEYNING.—October 7th.—For the supply of granite and granite chippings, and hire of road roller, for the rural district council.—Mr. G. W. Warr, surveyor.

ABERBARGOED.—October 7th.—For the supply of limestone and basalt, for the urban district council.—Mr. D. H. Price, surveyor.

STANLEY.—October 7th.—For making up roads and surface-water drainage, for the urban district council.—Mr. John G. Ridley, clerk.

HITCHIN.—October 7th.—For making-up work, for the rural district council.—Mr. A. E. Passingham, clerk.

HORNSEY.—October 7th.—For making up with tarred bituminous or asphalt certain roads, for the corporation.—Mr. E. J. Lovegrove, borough engineer.

TOTTENHAM.—October 8th.—For making up Barry-avenue, for the urban district council.—Mr. Edward Crowne, clerk.

BEDLINGTON.—October 8th.—For the supply of hand-broken whinstone, for the urban district council.—Mr. C. D. Forster, joint clerk, 24 Grainger-street West, Newcastle-on-Tyne.

WEETSLADE.—October 8th.—For paving work, for the urban district council.—Mr. William Webb, clerk.

STOKE NEWINGTON.—October 8th.—For supplying and laying 4-in. creosoted deal blocks, for the borough council.—Mr. George Webb, town clerk.

MOUNTAIN ASH.—October 8th.—For carrying out private street works, for the urban district council.—Mr. W. G. Thomas, surveyor.

ISLINGTON.—October 8th.—For the supply of Jarrah wood paving blocks, for the borough council.—Mr. W. F. Dewey, town clerk.

EAST HAM.—October 8th.—For tar-paving playgrounds, for the Education Committee.—Mr. H. C. Padgett, secretary, Education Offices.

BIRKENHEAD.—October 9th.—For private street works, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor.

ENFIELD.—October 9th.—For making up part of Farr-road, for the urban district council.—Mr. T. W. Scott, clerk.

CLEETHORPES.—October 9th.—For making up Osborne-street, for the urban district council.—Mr. B. Greaves, clerk.

BEDFORD.—October 9th.—For new paving works and tar-paving works, for the corporation.—Mr. Chas. Stimson, town clerk.

OLDHAM.—October 10th.—For making-up work, for the urban district council.—Borough Surveyor.

HALE.—October 11th.—For making up a street, for the urban district council.—Mr. J. G. Whyatt, clerk.

HARROW-ON-THE-HILL.—October 12th.—For making up private streets, for the urban district council.—Mr. J. Strachan, clerk.

COCKERMOUTH.—October 12th.—For widening a roadway, for the rural district council.—Mr. J. H. Musgrave, clerk.

KENSINGTON.—October 14th.—For making up portion of a highway, for the borough council.—Mr. W. Chambers Leete, town clerk.

DARTFORD.—October 14th.—For making up certain private streets, for the rural district council.—Mr. Eustace J. Hobbs, clerk.

WANDSWORTH.—October 14th.—For repairing parts of two roads in Southfields, for the urban district council.—Mr. D. A. Nicholl, town clerk.

WEST SUSSEX.—October 14th.—For the supply of about 14,000 gallons of tar, for the county council.—Mr. H. W. Bryan, county surveyor, 23 North-street, Horsham.

BROADSTAIRS.—October 14th.—For the supply of granite macadam, pit flints, pit gravel, hire of stone rollers and carting and laying limestone tar paving, for the urban district council.—Mr. H. Hurd, town surveyor.

SHERNESS.—October 14th.—For the supply of kerbs of granite, Kentish rag kerbs, hoggers and Thames ballast, for the urban district council.—Mr. W. H. Stallon, clerk.

GLYNCORRWG.—October 14th.—For making up work in several streets, for the urban district council.—Mr. W. P. James, surveyor.

CLAYDON.—October 14th.—For making up a thoroughfare, for the urban district council.—Mr. D. J. Bell, surveyor.

GUILDFORD.—October 16th.—For making up approach to isolation hospital, for the corporation.—Mr. A. D. Jenkins, town clerk.

CHELMSFORD.—October 17th.—For street works in two thoroughfares, for the corporation.—Mr. W. Smith, town clerk.

CROYDON.—October 17th.—For making up private streets, for the rural district council.—Mr. E. J. Gowen, clerk.

PRESTON.—October 18th.—For making up several roads, for the corporation.—Borough Surveyor.

BRITON FERRY.—October 19th.—For the supply of broken granite or basalt, for the urban district council.—Mr. Alex. Clarke, engineer and surveyor.

Sanitary.

KEMPSTON.—October 7th.—For the construction of house connections, for the urban district council.—Mr. William Payne, clerk.

STOKE-ON-TRENT.—October 7th.—For the supply of three teams for scavenging, for the corporation.—Mr. E. B. Sharpley, town clerk.

BLAYDON.—October 8th.—For removal of contents of ashpits, for the urban district council.—Mr. H. Dalton, clerk.

BRADFORD.—October 9th.—For the construction of circular outfall sewer in tunnel, and two shafts, for the corporation.—Mr. Frederick Stevens, town clerk.

POOLE.—October 9th.—For emptying cesspools, for the rural district council.—Mr. P. E. L. Budge, clerk.

KIRKBY-IN-ASHFIELD.—October 15th.—For laying 4,378 yds. of iron and stoneware outfall sewers, with manholes and other works, for the urban district council.—Mr. E. Bertram Hibbert, clerk.

BLYTH.—October 15th.—For scavenging work, for the rural district council.—Mr. F. Hopkinson, surveyor, 66 Bridge-street, Worksop.

BINGLEY.—October 15th.—For the supply and erection of revolving sprinklers, and floor tiles, for the urban district council.—Mr. H. Bottomley, engineer and surveyor, Town Hall.

BOLTON-UPON-DEARNE.—October 21st.—For the construction of stoneware-pipe sewers and manholes, and erection of pumping station and filters, for the urban district council.—The Surveyor.

HAYES.—October 21st.—For the construction of percolating filters, sludge beds, and humus tank, and alterations at existing works, for the urban district council.—Mr. D. C. Fidler, engineer, Grange-road, Hayes.

Miscellaneous.

BRISTOL.—October 14th.—For the supply of cement, drain pipes, and paints, for the corporation.—Mr. Lessel S. McKenzie, city engineer and surveyor.

BOOTLE.—October 16th.—For excavations and drainage in recreation ground, for the corporation.—Borough Engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.

CHELMSFORD.—For paving work with granite blocks, for the corporation.—Mr. P. T. Harrison, borough surveyor:—

Thomas Adams, Wood Green, N.	£2,316
J. Mowlem & Co., Limited, Westminster, S.W.	2,245
W. H. Wheeler & Co., Limited, Southwark	2,243
G. Wimpey & Co., Hammersmith, W.	2,226
W. Griffiths & Co., Bishopsgate, E.C.*	2,102
G. Porter, Buckley	2,159
Brookes, Limited, Westminster (not in accordance with specification)	1,947

FELTHAM.—Accepted for the supply of granite, for the urban district council.—Mr. G. Stevens, surveyor:—

Johnston Brothers, London, 12s. 11d. per ton.

HAMMERSMITH.—For paving east side of footway in Wood-lane, for the borough council.—Mr. H. Mair, borough surveyor:—

Mowlem & Co., Westminster, S.W.	£349 & £438
H. & J. Jones, Fulham, S.W.	336
W. H. Wheeler & Co., Limited, London, S.E.	324
Wimpey & Co., Hammersmith	320
Adamant Stone Paving Company, Westminster, S.W.*	305

HESTON.—For relaying wood paving at Hounslow, for the urban district council.—Mr. J. G. Cassy, engineer and surveyor, Council House, Hounslow:—

Wm. Griffiths & Co., Limited, London	£2,061
Improved Wood Pavement Company, Limited, London	2,676
Acme Wood Flooring Company, Limited, London	2,655
J. Mowlem & Co., Limited*	2,555

HEXHAM.—Accepted for laying 3¾ miles of earthenware pipe sewers, manholes, and flushers, for the rural district council.—Mr. J. E. Parker, Post Office Chambers, Newcastle:—

J. W. Henderson, South Gosforth, £2,674.

HUNGERFORD.—For the erection of workmen's dwellings, for the rural district council.—Mr. W. S. Raine, surveyor:—

Messrs. Hoskings Brothers, Newbury	£1,366
Messrs. J. Edwards & Son, Hungerford	1,071
W. T. Adam, Lambourn, Berks	995
G. Elms, Newbury*	880

LEEK.—For the erection of a public convenience, for the urban district council.—Mr. W. E. Beacham, surveyor:—

T. Grace, Leek	£370
S. Salt, Leek	322

PETERBOROUGH.—For the construction of sewerage works and pumping machinery, for the rural district council.—Mr. G. A. Penwill, sanitary engineer:—

Sewers, Pumping Stations, &c.

W. Pattinson & Son, Ruskington	£11,793
G. Bell & Sons, London	10,138
G. Henson & Sons, Wellingboro'	9,871
Moss & Sons, Loughboro'	9,592
J. Riley, Cheltenham	9,021
C. Chamberlain, Leicester*	8,752

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

4-5.—Royal Sanitary Institute: Meeting at Lewes; Mr. D. Roberts, borough surveyor, on "The New Sewerage System for Lewes, with Special Reference to the Discharge of Effluents into Tidal Streams."

7.—Society of Engineers: Mr. E. R. Matthews on "Town Planning from an Engineering Aspect," Institution of Electrical Engineers, Victoria-embankment, W.C. 7.30 p.m.

11-12.—Institution of Municipal Engineers: Annual General Meeting in London.

15. Institution of Municipal Engineers: Eastern District Meeting at Godmanchester.

19.—Institution of Municipal Engineers: Joint Meeting of Northern and Yorkshire Districts at Harrogate.

19.—Institution of Municipal and County Engineers: North Wales District Meeting at Wrexham.

26.—Royal Sanitary Institute: Meeting at Alton; Discussions on "Housing Problems in County Areas" and "Municipal Work in Alton." Town Hall, 11.15 a.m.

TENDERS WANTED.

BRITON FERRY URBAN DISTRICT COUNCIL.

TENDERS FOR BROKEN GRANITE, &c.

The Urban District Council of Briton Ferry invite Tenders for the Supply of Broken Granite or Basalt delivered in quantities required.

Tender Form and Specification may be obtained upon application to the undersigned.

Sealed Tenders, endorsed "Tender for Granite," to be delivered at my office on or before the 19th day of October, 1912.

The Council do not bind themselves to accept the lowest or any Tender.

H. ALEX. CLARKE,
Engineer and Surveyor.

Council Offices,
Briton Ferry.
October 1, 1912.

WEST SUSSEX COUNTY COUNCIL.

TENDERS FOR TAR FOR SURFACE TREATMENT.

The above Council invite Tenders for the Supply to the various Railway Stations within the County of about 150,000 gallons of Tar, in such quantities as directed, during the season ending 30th September, 1913.

Persons tendering should give the following particulars: (*a*) Specific Gravity; (*b*) Percentage of Water, Ammonia and Free Carbon; (*c*) Percentage of Tar produced in the Manufacture of Carburetted Water Gas.

The Council does not bind itself to accept the lowest or any Tender, and reserves the right to accept Tenders for any portion of the quantity above stated.

Tenders, marked "Tar," must reach me on or before the 14th October, 1912.

H. W. BOWEN, A.M.INST.C.E.,
County Surveyor.

23 North-street,
Horsham.

(Continued on p. xviii.)

APPOINTMENTS OPEN.

COUNTY BOROUGH OF HUDDERSFIELD.

The Corporation require the services of an experienced Highways Superintendent, to take charge of a District under the Borough Engineer.

Applicants must have had practical experience in sewering, paving and macadamising of roads, and be competent to set out and measure up work, and keep daily accounts of all labour and materials used.

The person appointed must have had previous practical experience in a similar situation, and be prepared to reside within his district.

For statement of duties apply to the Borough Engineer.

Salary £120 per annum.

Applications, in the handwriting of candidates, giving full particulars of present and previous occupation, age, &c., accompanied by copies of not more than three testimonials of recent date, endorsed "Highway Superintendent," must be addressed to me not later than 10 a.m. on Wednesday, the 9th October, 1912.

Canvassing will disqualify.

K. F. CAMPBELL, M.INST.C.E.,
Borough Engineer and Surveyor.

1 Peel-street, Huddersfield.
September 24, 1912.

SINGAPORE, STRAITS SETTLEMENTS.

MUNICIPAL ENGINEER'S DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant, under 32 years of age, and of sound constitution, chiefly for their new sewage scheme. He must have received a good technical education, a regular training as a Civil Engineer, and including a practical knowledge of surveying, levelling and estimating. He must also have had special experience in designing and constructing sewerage and sewage disposal works and waterworks, and their maintenance. Preference will be given, other things being equal, to applicants who have passed the Examination of the Institution of Civil Engineers—Associate Members—or that of the Institution of Municipal and County Engineers. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out. The salary will be 350 dollars per month, paid monthly in dollars, the currency of the Colony, the value of the dollar being two shillings and fourpence sterling. Such local transport allowance as may from time to time be sanctioned by the Commissioners will be paid. Applications, stating age and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies (only) of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope-street, Glasgow (who will give further particulars if requested), not later than Tuesday, 8th October next.

ROMFORD RURAL DISTRICT COUNCIL.

The above Council require, at once, a Second Assistant in their Surveyor's Department, who is able to make surveys and take levels, and is a neat draughtsman.

Age not to exceed 30 years.

Preference will be given to applicants with a good knowledge of building construction and by-laws.

Salary £105, rising by yearly increments of £5 to £120 per annum.

Applications (no forms), with copies of not more than three testimonials, endorsed "Surveyor's Assistant," must reach me, the undersigned, not later than 12 o'clock noon on Tuesday, the 15th October, 1912.

Canvassing in any form will disqualify.

(By order)

T. W. A. GREENHALGH,
Clerk to the Council.

13 North-street,
Romford.
October 1, 1912.

GOLD COAST.
SUPERINTENDING SANITARY ENGINEER.

The Secretary of State for the Colonies is about to appoint a Superintending Sanitary Engineer for service in the Gold Coast. Candidates should be qualified Civil Engineers and preferably Members or Associates of the Institute of Civil Engineers with experience of drainage works in tropical countries.

It is desirable that candidates should be over 36 years of age, but this is not essential. The selected candidate will be required to take charge of constructional and other work in the Colony of the nature of Sanitary Improvements. Salary £500 per annum, rising by annual increments of £20 to £600 and a duty allowance of £100 per annum. Free single quarters or an allowance for rent in lieu. First-class passage out and home on satisfactory termination of engagement. Period of engagement, two tours of twelve months' continuous residential service. The appointment will become permanent subject to satisfactory service. Leave of absence on full salary for two months after twelve months' continuous residential service, increased to four months if returning to the Colony. Selected candidate is required to sail as soon as possible. Medical examination. The selected candidate, if married, will not be permitted to take his wife to the Colony on first appointment.

The Royal Sanitary Institute have been asked to furnish the names of suitable candidates, and applications, addressed to the Secretary of the Institute, 90 Buckingham Palace-road, S.W., should be received by Tuesday, October 8th, 1912.

ADMINISTRATIVE COUNTY OF THE SOKE OF PETERBOROUGH.
COUNTY SURVEYOR.

The County Council are desirous of obtaining at the end of the current year the undivided services of a thoroughly competent Surveyor and Draughtsman to undertake the duties—(*a*) of maintaining, &c., the Rural Main Roads and Bridges of the County; (*b*) pertaining to the adaptation of land and the erection and supervision of buildings for Small Holdings; (*c*) relating to the inspection of and additions or alterations to School Houses and Buildings, and generally to render such services as may reasonably be required of him by this Council.

Salary £200 per annum, to include clerical and other expenses, except travelling, for which an allowance of £50 per annum will be made. The person appointed will be required to reside within the County and commence his duties on the 1st of January next.

Applications, accompanied by testimonials (not exceeding three in number), to be sent to me on or before the 19th day of October next, marked "Applications for County Surveyorship."

N.B.—Personal canvass will disqualify.

WALTER J. DEACON,
Clerk of the County Council.

Cross-street, Peterborough.
September 19, 1912.

MERRYWEATHERS'

HOSE PIPES

- FOR -

FLUSHING & FIRE SERVICE.

MERRYWEATHERS'

LEATHER HOSE

Single and Double Riveted, made from the finest selected butts. British made throughout.

A Customer writes.—

"I have great pleasure in testifying to the lasting "qualities of your Leather Hose, which has been in "daily use at the Cattle Market and Fish Market for "a considerable period, it has stood rough usage "and hard work remarkably well."

MERRYWEATHERS'

"DUB SUB" (Double Substance) CANVAS HOSE

A good, strong Hose, made from best long flax on improved looms at Greenwich Road Factory.

Capt. W. G. Pidduck, of the Kent County (Canterbury) Fire Brigade, wrote in April, 1903:—

That Merryweathers' Hose supplied in 1867 was used at a fire in Canterbury Cathedral in 1872, and was still in use at the date of writing.

Write for "HINTS ON HOSE." 70 pages.

MERRYWEATHER & SONS,

Fire Engineers and Hose Makers,

GREENWICH, S.E., LONDON.

INVINCIBLE TALBOT

If you'll look into a car as well as at it—analyse its construction and take into account shrewdly and technically the all-important matters of material and engineering factors of safety and endurance—you're bound to be interested in the Invincible Talbot. When you're looking at cars remember—what you can't see is more important than what you can!

Specifications and full particulars on request.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. OCTOBER 11, 1912. No. 1,082.

Minutes of Proceedings.

Sewage Disposal by Oxidation Methods.

The Fifteenth International Congress on Hygiene and Demography, which was held at Washington, U.S.A., last month, was the occasion for the presentation of a number of papers dealing with sewerage and sewage disposal, and the committee of the congress took the opportunity to obtain two papers upon the above subject from an engineer and a chemist respectively, the authors being Mr. J. D. Watson, M.INST.C.E., of Birmingham, and Dr. G. J. Fowler, F.I.C., of Manchester. A study of these companion papers—one of which appeared in last week's and the other being reproduced in the present issue—provides some interesting comparisons. Dr. Fowler devotes more space to consideration of the various modern methods of preliminary treatment than we should have anticipated from the title of the paper, but both authors are agreed as to the influence of the preliminary treatment upon the choice of the method of subsequent treatment by oxidation. Again, both authors set forth the advantages and disadvantages of the percolating filter and contact bed respectively, but while Mr. Watson prefers percolating filters, Dr. Fowler states that "there can be no doubt that the main advantage of the contact bed lies in its freedom from nuisance." Mr. Watson bases his preference upon the belief that the oxidising process is dependent upon the free admission of air into the heart of the bed, and "it is obvious that the air supplied to this form (the contact bed) of purifying agency is restricted to the volume of sewage treated, whereas it may be equal to many times that volume in a well-constructed percolation filter." He also gives a very full description with costs of the construction of a large area of percolating filters at Birmingham, and deals with relative efficiency in distribution of fixed sprays and a rotating distributor, which indicate that, on the whole, the ultimate result is much the same in spite of the admitted lack of uniformity of distribution by fixed sprays. This will confirm the experience of American engineers, who in nearly all cases adopt this method of distribution.

On the other hand, Dr. Fowler points out that the spraying of anything but a fresh tank effluent on percolating filters is attended with a considerable nuisance from smell, and in any case the development of insect life, particularly flies and spiders, is often extraordinary. Further, he considers that, "however good the effluent from such [percolating] filters, and however economical their construction and maintenance, it cannot be said that such a process meets all sanitary and aesthetic requirements." In these two papers we have the carefully considered arguments of two acknowledged authorities, each with a wide experience of all modern methods, the one in favour of percolating filters and the other in favour of contact beds. For our own part we recognise the greater efficiency of percolating filters in the volume treated per cubic yard of filtering material when dealing with "weak" or "average" sewage, but we believe that much of the opposition to contact beds has been due to comparisons made with results obtained from contact beds which were not only badly designed and constructed, but improperly operated. We have dealt with this subject in these columns on several occasions in the past, and we would only repeat that if contact beds had always been constructed with the same care as percolating filters, and particularly in the provision of false floors for drainage and ample fall on the bottom, and, in addition, they were always operated in such a manner that they were filled in one hour at the most, and only once per day in dry weather, the ultimate results, both as to degree of purification and as to life of the material, would compare very favourably with those from percolating filters. The two papers in question, however, form a valuable and interesting summary of the arguments for and against these two methods for the treatment of sewage by the process of oxidation, and will doubtless be considered worthy of careful study, and will be filed for reference by all who are interested in the subject.

* * *

The Cleaning of Water Mains.

The cleaning of water mains by means of mechanical scrapers is no new thing, but, owing to various causes, it has not been adopted hitherto as generally as its merits deserve. Recently several papers drawing attention to the value of the mechanical scraper to the waterworks engineer have been written. Thus Mr. Osborne Redford, in an article published in *Engineering and Contracting*, pointed out that the process was not really expensive, but that a false impression had been created owing to the exorbitant prices charged by certain contractors, and he advised water authorities to do the work themselves, and, moreover, gave a practical description of the scraper and its operation. Mr. Harry Blackadder, in an article contributed to THE SURVEYOR of February 10, 1911, drew attention to the splendid results of main cleaning, describing his own work with the "Glenfield" scraper, and giving valuable practical advice. Mr. E. D. Groves, on July 14, 1911, contributed an illustrated article describing some very successful pipe-scraping operations at South Molton. This work was carried out at the advice of the Local Government Board, the Eric (Patent) Pipe Scraper Company, of Monmouthshire, being the contractors. The machine is fully described and illustrated in this article.

In the present issue we give some particulars of special interest relating to the cleaning of water mains in the city of Halifax, Nova Scotia, furnished by Mr. F. W. W. Doane, the city engineer, in a paper read before the Union of Canadian Municipalities at Windsor, Ontario. The paper is particularly valuable because it contains exact prices

and gives the results of main cleaning extending over a period of thirty-three years. The cost of cleaning must, of course, vary according to the different conditions, but it is perfectly clear that with a little practice the waterworks engineer should be able to attend to the cleaning of his own mains without incurring any great expense. It is also clear that those who have seriously undertaken the work of main cleaning speak well of the process. When we have figures showing that 29,500 ft. of 15-in. main have been cleaned in ninety-five minutes, at a cost of £1 14s. 7d., or ·0142d. per foot-run, it is quite clear, even after making every allowance for the fact that the mains are cleaned annually at Halifax, that the process is not very costly. We are told that the incrustation of oxide of iron thus removed sometimes reduces the capacity of the Halifax mains by 50 per cent. In Mr. Redford's paper the actual costs of cleaning were given as 2·125d. per foot-run for 4-in. mains, 1·415d. per foot-run for 6-in. mains, while the cost of cleaning 5 miles of 20-in. main is stated to have been £312 10s. Seeing that the process will remove scale or deposit entirely, it may often save the relaying of a main. Large stones and pieces of lead from bad joints are sometimes removed from pipes, but the real value of scraping lies in the removal of incrustation or vegetable growth. At South Molton a main which had a theoretical discharge of 170,000 gallons per day was found to deliver only 92,000 gallons per day, owing to incrustation. If it had not been cleaned a very large outlay would have been required to set things right.

From the evidence given it appears that, though the cleaning of a badly incrusted main may be costly as compared with Mr. Doane's figures, the subsequent cleaning may be done at very small expense, and for this reason, taken together with the great advantage of maintaining mains with their full capacity, it will be well to consider the policy of the annual cleaning of certain mains.

* * *

The Engineer and Town Planning.

The arguments which we recapitulated in our last issue in regard to the peculiar qualifications of municipal engineers for the preparation and execution of town planning schemes are well illustrated by several passages in the paper on "Town Planning from an Engineering Aspect," which was read before the Society of Engineers on Monday last by Mr. Ernest R. Matthews, Assoc.M.Inst.C.E. In his capacity as borough engineer of Bridlington Mr. Matthews has gained practical knowledge of the questions with which his paper dealt in the design of a scheme for that town; and his experience, added to that of many other experts, leads to the general conclusion that many of the most important parts of a town planning scheme are of a purely engineering character, and that, provided an architect is consulted in regard to matters in which his experience would be valuable, the general design of a scheme should be in the hands of an engineer experienced in town management and development.

Mr. Matthews pointed out that the problem of town planning in a residential district is very different from that in a manufacturing centre, and he dealt with the two cases separately. Inasmuch as the fitness of municipal engineers to deal with such matters is sometimes challenged in certain quarters, it may not be inappropriate shortly to point out certain matters which are inseparable from any town planning scheme, and at the same time are clearly within their special province. As regards a scheme for a residential district, the direction, width, classification, and method of construction of the various roads are matters of primary importance. The position of most of these roads will be determined by the best and most suitable direction of main and intercepting sewers, and this is a matter solely for the decision of the engineer. Again, economy in road construction is of vital importance, and has an enormous influence upon the possibility of erecting houses which can be let at rents which are at the same time both reasonable and remunerative. Nevertheless the first cost must not be reduced below the point of efficiency, or the economy will turn out to be entirely false, being more than counteracted by an excessive annual charge for maintenance.

In regard to sewerage and sewage disposal, it is for the engineer to ascertain whether the existing sewers and disposal works are capable of taking the drainage from the proposed area, and, if not, whether they should be enlarged, or whether it would be more economical to construct new sewage disposal works for the area to be laid out, and the questions of gravitation or pumping and of the disposal of storm water have to be dealt with. In the case of the development of a manufacturing district the engineer has many additional problems to face. Among these may be mentioned the supply of electrical energy for power and lighting, and the provision of wharfage. Moreover, such a district is best suited for the erection of refuse destructor works, tramway depots, and other works required for the various municipal services. Mr. Matthews' paper looked at the matter from the point of view of the engineer, and was therefore chiefly concerned with such subjects as we have just mentioned. It concluded with a brief description of the scheme which he has prepared for Bridlington, and an expression of opinion that it is necessary in town planning matters that the engineer shall co-operate with the architect. This has always been our claim, and a consideration of the engineering questions which arise is sufficient to show that the training and experience of the municipal engineer are indispensable to the production of a thoroughly efficient and economical scheme.

* * *

Government by Commission.

For many years now American municipalities have been seeking a form of civic government which would ensure efficiency of administration and at the same time adequately safeguard against corruption. Various expedients have been tried without proving satisfactory in practice, but in recent years considerable progress has been made in what is known as the "Commission" form of municipal government. The success which has attended the inauguration of this institution is undoubtedly due to its recognition of two fundamental notions which must be at the root of any system of government of a modern municipality. In the first place, the increasing and ever widening scope of the duties which fall to be discharged by the governing authority of a modern city render it essential that the services of permanent officials who are experts in the work of their respective departments shall be invoked. If these officials, however, are left to themselves, and are not subject to supervision and control by the ratepayers or their representatives, it is evident that grave abuses might easily result. The second requirement therefore is that the permanent staff shall be under the supervision of some authority who will form a connecting link between the expert official and the citizens. In the "Commission" form of government, this link is supplied by an elective commissioner, who, although not an expert official, acts in a capacity analogous to that of an English Council Committee.

Mr. Oswald Ryan, of Harvard University, in a recent analysis of the problem of city government, expresses the view that the success of the English system is largely due to a satisfactory adjustment having been made between the professional and lay element. Be this as it may, a comparison of the English system of government by a council and committees with the American system of government by a commissioner can hardly fail to be of interest. We are led to wonder which system

works more satisfactorily in regard to such questions as security of tenure. The English system cannot really be considered independently of the relation of the local authority to the central government. English officials ask for more central control in the matter of appointment and dismissal, and in the absence of such control it seems to us that from the point of view of the official it would be far better to be in the hands of a committee rather than under the "control" of a single elected commissioner.

* * *

International Testing Association.

An exceedingly interesting congress was recently held in New York under the auspices of the International Association for Testing Materials. A variety of topics arose for discussion, but we may perhaps draw attention to two contributions to the proceedings which were made by Mr. Edwin O. Sachs, who is well known as the chairman of the British Fire-Prevention Committee. The first of these dealt with the fire resistance of concrete and reinforced concrete, and after recapitulating the methods of testing adopted in England under the universal standards, contained certain valuable suggestions as to some international tests desirable on special matters relating to these materials. These suggestions were embodied in a series of resolutions expressing the opinion that it is advisable in the future investigations of the strength of concrete and reinforced concrete as used in buildings to obtain reliable data of the effect of fire at high and at moderate temperatures upon these materials; that the tests in different countries should be arranged as far as possible on a uniform basis; and that a special sub-committee should be formed to deal with the matter. In view of the enormously increased use of reinforced concrete, there can be no doubt as to the value of such a series of tests as Mr. Sachs proposes, and the work of the sub-committee will be watched with great interest.

The other paper submitted by Mr. Sachs contained a record of the rather limited scientific research work as to stresses and strains on reinforced concrete which has been undertaken in Great Britain, and in respect of which reliable data are obtainable. Unfortunately very little research work of this character has been undertaken in this country, and Mr. Sachs concludes with the hope that his contribution, by its poverty compared with the contributions from other countries, may assist in an awakening as to the necessity of inaugurating systematic research work.

The Manchester Appointment.

Elsewhere in this issue we quote in full *The Manchester Guardian's* report and comment as to the Manchester City Council's discussion relative to the important contemplated appointment of a deputy city surveyor. It will be seen that, for the moment, the council are not agreed upon the exact terms of the appointment, the points at issue being (1) the salary to be offered, and (2) the limitation of candidature to applicants who are full members of the Institution of Civil Engineers. With regard to the first point, we venture to hope that the commencing remuneration will be at least £750 per annum. It must be remembered that in the present city surveyor, Mr. T. de Courcy Meade, Manchester has an engineer of unquestioned professional abilities, a born administrator, and a man who has in all things walked "straight as a gun barrel" along an official path beset with difficulties, especially pronounced in the earliest period of his appointment—eighteen years ago. Mr. de Courcy Meade has set a very high standard for a deputy who should be able to fill the chief post in due course—temporarily perhaps on occasions, permanently at a time which we trust may be many years hence. We think the Council, in seeking such a deputy, wisely stipulated for full membership of the Institution, as no good purpose would be served by giving juniors the trouble of applying. It is, however, the adequate salary that is essential and that is eminently justified in view of the great engineering works which, as *The Manchester Guardian* emphasises, the city has in hand and in prospect. Granted that and the city might limit applications from the fit and few by inviting them only from candidates who are members of the Institution of Civil Engineers and who have had special experience in the main drainage of large cities.

* * *

Filing Plans.

Having regard to the varied character of the administrative duties which fall to the lot of the municipal engineer, it is hardly surprising that the problems of office management frequently force themselves upon his attention. It may be taken as an axiom that any system is wasteful which demands that the time of the chief official, who is a skilled expert in professional work, should be devoted to any considerable extent to matters which concern the mere machinery of office routine. On the other hand, it is necessary that his time shall not be wasted owing to a lack of some efficient system by which, for example, any desired document or plan may easily be found. The methods in vogue for filing and indexing plans are many and diverse, and it has been suggested to us that a useful purpose would be served if we were to invite correspondence on the subject from our readers. One system, which has been found to work very well, depends upon the two fundamental ideas of having three or four stereotyped sizes of paper, to one of which every plan must be cut, and keeping the plans in drawers in specially made cabinets, grouped according to subject-matter. The class and number of each plan are stencilled on the back, and correspond to a similar entry in the plan index-book. Thus there is a definite place for every drawing. No doubt this system is not perfect, nor is it necessarily adapted to the peculiar conditions of every office. We merely mention it as an example, and we shall be glad to hear from any of our readers who have found other methods of arrangement to give satisfactory results.

* *

Electrolosis of Concrete.

A suggestion is made by Mr. Cyril de Wyrall, in a paper published in the Proceedings of the International Association for Testing Materials, to the effect that ordinary concrete is liable to disintegration by electrolytic action. We deal with the paper elsewhere in these pages. It seems upon the whole improbable, in the face of tests made and of generally observed facts, that concrete is likely to be affected in the manner suggested; none the less, it is a very important matter, and seeing that the author brings forward several instances of the apparent disintegration of wet concrete by electric currents the whole subject ought to be investigated more thoroughly than has been done hitherto. It would be useful if those of our readers who may have to deal with the disintegration of concrete from some unknown cause were to take the possibility of electrolytic action into account. If any reader has had an experience similar to that of Mr. de Wyrall, it would be advantageous to engineering generally for him to add his evidence to that already obtained. The wide use of concrete and the enduring nature of the material under most conditions gives little support to the theory of electrolosis, but, on the other hand, there may be certain special conditions where electrolytic disintegration does take place, and, if so, it is of the first importance that we should know them. We therefore invite communications from any of our readers who may be able to throw further light upon the subject.

Town Planning from an Engineering Aspect.

By ERNEST R. MATTHEWS, assoc.m.inst.c.e., f.g.s., Borough Engineer of Bridlington.

The architectural aspect of town planning has been much discussed of late, but from an engineering standpoint the subject has had less attention. It is easier to regard the matter from the former point of view, for a mere reference to town planning raises in one's mind such questions as whether the houses are to be twelve or forty to the acre; are to be set back 10 ft. or 30 ft.; are to be detached, semi-detached or in terraces; whether some portion of the area to be laid out shall be reserved for large residences, other portions for workmen's dwellings and bungalows, others for shops, and a further area for factories; or whether the two latter are to be kept out of the area entirely.

At Ruislip-Northwood the town planning area is divided up as follows:—

¼ of site area to be occupied only by	bungalows.
⅛ " " " "	shops.
⅛ " " " "	ordinary dwelling-houses and larger residences.

The provision of open spaces for parks and recreation grounds, and of sites for public buildings, monuments, &c., all affect the architectural aspect of the subject; but from an engineering point of view many other important matters have to be considered. As town planning in a residential district is very different from that in a manufacturing centre, we will consider the two cases separately.

TOWN PLANNING IN A RESIDENTIAL DISTRICT.

The town planning scheme prepared by the author for the Bridlington Corporation, part of which is shown on Plate 2, is one affecting a purely residential area. In preparing such a scheme the first matter to be dealt with is to fix the area to be planned. A knowledge of local conditions and requirements is absolutely necessary in deciding this; and those parts of the town in which building operations are likely to proceed most rapidly should be included in the area.

This area having been decided upon, and the Local Government Board's sanction to prepare a scheme for such area having been obtained, the next point to receive consideration should be the direction, width and method of construction of the various roads. Let us now consider these three points together.

(1) *Main Arterial Roads.*—At the outset the direction of the through-traffic roads should be fixed, and these should be in such a position that direct means of communication will be provided between one busy part of the town and another, or they should connect up important existing roads. The position of most roads will be determined by the best direction for main and intercepting sewers, and this is a matter for the decision of the engineer. Plate 2, which is the author's suggested scheme for the planning of a certain portion of Bridlington, which now consists of fields, shows certain arterial roads illustrating this point. The author strongly urges that none of such roads should be less than 75 ft. in width, and that they should be constructed of tar macadam in order to ensure a minimum of dust and noise. The footpaths should be of asphalt, the road should be provided with grass margins and trees, and the author recommends that they be of the section shown in Fig. 1, the houses being set back 25 ft., making a total distance between the buildings of 125 ft.

A brief description of such a road is as follows:

Width of carriageway	35 ft.
Width of footways	10 ft.
Width of grass margins	10 ft.

Such a road is of sufficient width to take a single line of trams in crowded parts and a double line on the outskirts.

The author suggests the following method of construction:—

Foundation.—The sub-foundation having been carefully prepared and shaped to the finished profile, the foundation should then be laid; this may consist of hand-packed rubble stone, preferably sandstone, or (as at Bridlington on the outskirts) well rolled in with a 10-ton steam roller. In the case of a rubble stone foundation a thickness of 9 in. will probably be sufficient; these stones will be laid on edge and will vary in length from 6 in. to 9 in., and in thickness from 4 in. to 6 in., and be laid lengthways across the street. After the rubble stone has been carefully laid, it should be "blinded" with broken bricks, broken concrete, or broken stone so as to fill up the spaces between the stones. A 10-ton steam roller should then be applied, the road being well watered, until an even surface is obtained. Where a brickbat foundation is used the author's practice has been to make the depth 12 in. after rolling.

Tar Macadam.—The stone for this may be limestone or one of the softer kinds of granite. The author has found Scotch granite to be admirable for this purpose, and has used it very considerably for tar macadam, greatly preferring it to limestone after several years' experience with the latter. The stone should be in three sizes, and as regards the relative quantity of each size the author concurs with the suggestion made by Mr. John S. Brodie, M.INST.C.E., the borough engineer of Blackpool, as follows:—

60 per cent 2½ in.
30 " " from 2½ in. to ½ in.
10 " " " ⅜ " ¼ "
All below ¼ in. being discarded.*

The tar macadam should be laid and rolled in separate layers, being rolled first with a 6-ton and afterwards with a 10-ton steam roller. The author suggests a total thickness of 6 in. of metal after rolling.

The metal should be thoroughly dried, and all dust removed before mixing with the tar, which should have a temperature of about 260 deg. The author has usually had the mixing done by hand, but there are many excellent mechanical mixers in the market, and he would recommend the use of these. The estimated cost of constructing such a road at Bridlington, with brickbat foundation, would be £4 13s. 8d. per lin. yard of roadway, including footpaths, grass margins and tree planting.

(1a) *Secondary Roads.*—The secondary roads which are important roads not carrying through traffic might be 50 ft. in width, constructed in the same manner as the arterial roads—namely, of tar macadam, but of the section shown in Fig. 2. The set-back of the houses in these roads might also be 25 ft., and the distance between buildings would be 90 ft.

Width of carriageway	24 ft.
Width of footways	7 ft.
Width of grass margins	6 ft.

A road of this width will allow three lines of vehicles passing. The estimated cost of such a road would be £3 9s. 9d. per lin. yard.

(1b) *Subsidiary Roads.*—These are roads which carry practically no traffic except vehicles coming to the houses in such roads. Under these circumstances they need only be very narrow, say 28 ft. or 30 ft., with the houses set back 20 ft., and might be constructed in the manner shown in Fig. 3. These also, in the author's opinion, should be of tar macadam, with a thickness of 4½ in. of metal, and the foundations might be a trifle lighter than those in the more important roads. While a large amount of heavy traffic will not come upon them as upon the roads already referred to, a certain amount of such traffic will do so in the way of loaded furniture vans and other occasional heavy vehicles, and the road should be capable of carrying such loads.

Width of road	16 ft.
Width of footways	4 ft.
Width of grass margins	3 ft.
Depth of road foundation	9 in.
Thickness of tar macadam	4½ in.

It may be argued that a width of 16 ft. is insufficient, and it must be admitted that it is very debatable whether the cost of maintenance of such a road is much less than that of a road double this width, for the traffic upon a road is nearly always along the centre half of such road, and therefore this concentrated traffic would cause the narrower road to require almost as much repair in proportion to the traffic passing over it as a wider road. The author, however, urges that as most subsidiary roads are connected to no important roads, that many of them are

* Paper read on Monday evening at a meeting of the Society of Engineers.

* "Suggestions towards a Standard Specification for Bituminous bound Carriageways," by John S. Brodie, M.INST.C.E. Paper read at the Institution of Municipal and County Engineers' Annual Meeting, 1912

culs-de-sac, and that ordinary vehicular traffic on these roads will consist chiefly of light tradesmen's vehicles, a width of 16 ft. is sufficient. The estimated cost of such a road would be £2 8s. 5d. per lin. yard.

Cost of Road Construction.—This is a vital point with the landowner, for it determines to a large extent the class of buildings which he must erect if he is to be recouped for his outlay. The by-laws of our towns and cities are unreasonable in their requirements both as regards width and method of construction of

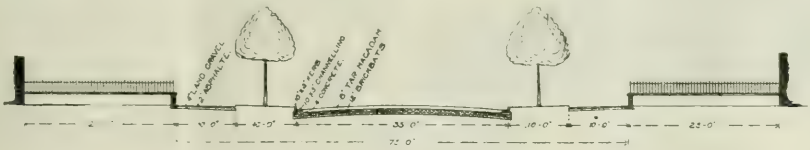

Fig. 1.—Through Traffic Street.

roads. How, for example, can one build workmen's cottages when the roads on which these are to abut must be 40 ft. in width, with flagged footways and a heavy type of kerbing, as is the case in many towns? In the author's opinion it is a waste of money to lay flags and put in, say, 12 in. by 8 in. kerbing in such a road, and an equal waste to make such a road 40 ft. wide. He has already suggested in this paper that 30 ft. is an ample width for a street of this class, and the footways should be of asphalt with grass margins, the latter being protected by stone edging, say

Fig. 3.—Subsidiary Road.

10 in. by 4 in. (see Fig. 3). Not only will this effect a great saving in cost, but roads constructed in this manner will present a more rural and pleasing appearance.

The by-laws requiring roads to be 40 ft. wide oblige the man who is intent on building small houses to

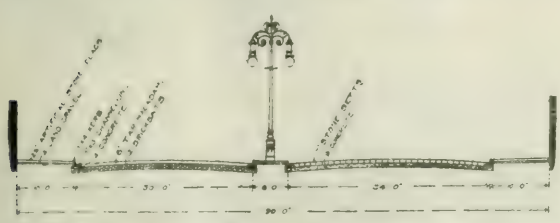

Fig. 4.—Arterial Road in an Industrial Area.

erect these with narrow frontages and deep backs, a class of house which is objectionable in many respects, a wider frontage with a shallow back being far preferable. The author deprecates the terrace type of cottages, which have been designated "coalercrows", this class of house would, in many cases, not have been erected if it had not been for the cost of roadmaking required by the by-laws, making it necessary for the landowner to crowd as many houses as possible on to his land.

It sometimes happens that a residential area in time becomes one through which heavy traffic passes to an industrial area which has sprung up beyond. Who is to pay for the reconstruction of the through-traffic roads in the residential area should such conditions arise? A proposal has been made, with the principle of which the author entirely agrees, that "in laying out land for residential purposes the developers should be called upon only to lay out and construct such roads as are needful to deal with the traffic of such area; and in the event of existing industrial conditions or future developments causing a need for heavier traffic-bearing roads through these residential areas, the extra cost of such roads over the cost of roads constructed for domestic traffic should be borne by the community."*

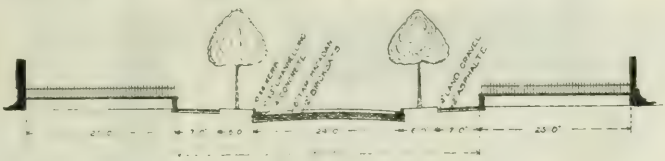

Fig. 2.—Secondary Street.

The Widening of Existing Roads.—In designing a town planning scheme it will probably be necessary to allow for the widening of some of the existing roads. This has been the case at Bridlington, where Cardigan-road, which now averages 36 ft. in width, is to be widened to 70 ft. In this instance the east side of the road is built up with large residences, but on the west side no buildings have been erected up to the present. The owner of this vacant land, however, is now desirous of erecting houses on that side of the road, and the corporation are asking him to give up a 35-ft. strip of land for the purpose of increasing the width of the road. Experience has shown that owners of land in various parts of the country have, generally speaking, been quite willing to give up a portion of their land for road widening purposes, for the reason that if their remaining land abuts upon a wider road it will be of more value to them, and the same argument applies to any houses which the landowner may erect facing the wider road. The corporation would, of course, construct the road. This matter of the improvement of existing roads is an important one, and must have full consideration when preparing a town planning scheme.

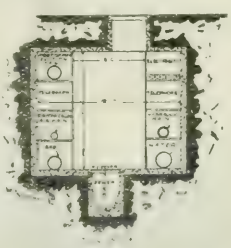

Fig. 5.—Section of Subway.

The Direction of Existing Public Footpaths. In preparing a scheme it is often advisable to improve the direction of existing public footpaths, for which purpose full powers are given by the Act, and the engineer should give careful consideration to this point.

Open Spaces. In planning a residential area it is

* Paper read by Alderman W. Rhodes, of the Chesterfield Town Council, at the National Housing and Town Planning Conference, at Manchester, 1912.

necessary to determine the best positions for parks, tennis courts, bowling green, children's playground, garden enclosures, sites for future public buildings such as public library, town hall, municipal offices, &c., unless the town is already well provided in that way, and land should be reserved for these purposes. In these matters the engineer will confer with the architect, and, of course, consult the various land-owners and others who have interests in the scheme, and it should here be noted that great tact on his part will be required in order to ensure the best results for the corporation he is serving.

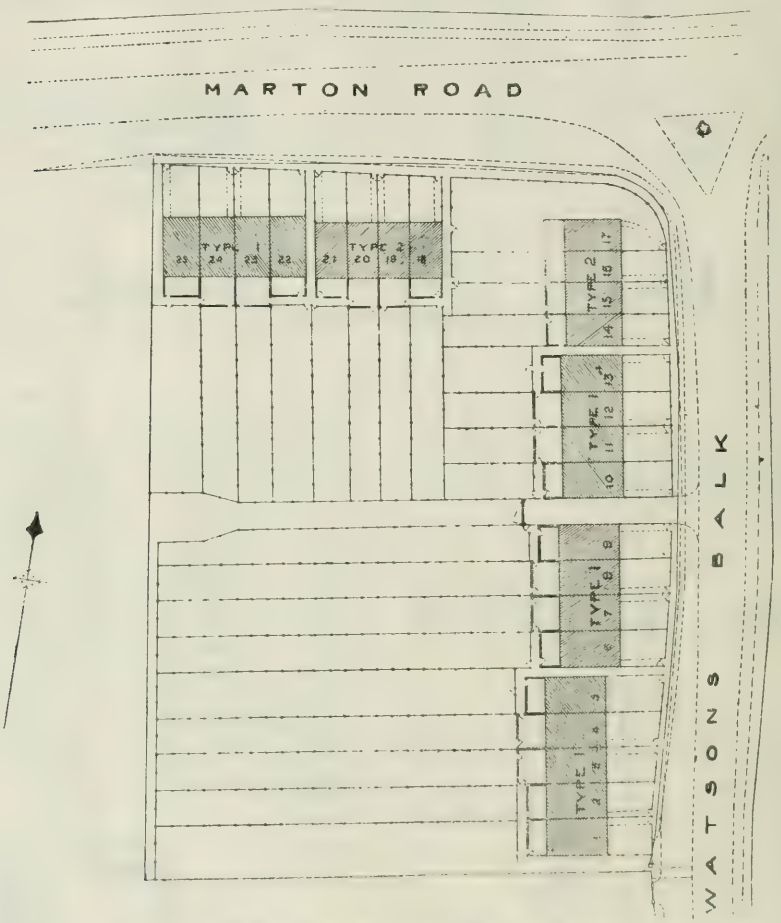
(2) *Sewerage and Sewage Disposal.*—Having dealt with the roads in the proposed area, the next matter for consideration is that of sewerage. The engineer must ascertain (*a*) if the existing sewers and disposal works are capable of taking the drainage from the proposed area, and if not whether it is proposed to enlarge them or to construct new sewage disposal works for the area to be laid out, (*b*) whether the levels permit of the area being drained into existing sewers, (*c*) how the storm water is to be dealt with.

At Bridlington, if a large area is added to the town as proposed, it will be necessary to take out the existing 12-in. northern outfall sewer which discharges into the sea below L.W.O.S.T. on the North Foreshore, and to put in a 24-in. or probably 30-in. outfall in its place, also to enlarge the existing screen chamber and to put in larger sewers for about ½ mile from the outfall sewer to the south-eastern corner of the area.

Then again on the south side of the town a portion of the area near Bessingby included in the scheme is too low to be drained into the corporation sewers, and while some of the front land may drain into the existing sewers, if the latter are lowered 5 ft. (and no doubt this will be done), the remainder of the sewage will have to be dealt with by the construction of disposal works within the area itself, or be discharged by means of a new outfall into the sea.

These instances of the difficulties that one meets with in designing a town planning scheme may be of interest to the members. The land developer should be expected to pay only for sewers of sufficient size to drain the area, and if he is required by the local authority to put in larger sewers, such as may be required eventually if the area is very considerably extended, the authority should pay the difference in cost.

As to the disposal of storm water, the author does not expect to meet with much difficulty in that way, as several good outlets are available. Separate surface-water drains will be laid in most of the roads, and these will be connected up to the existing surface-water drains.



Arrangement of Proposed Workmen's Dwellings, Bridlington.
(Plate I.)

(3) *Lighting.* The lighting of the area by means of gas or electric light is a matter of great importance, and the cost of the laying down of mains and cables from the nearest supply will have to be ascertained; if the corporation own these undertakings they may have to seek powers to extend their lighting area in order to include the town planned area.

(4) *Water Supply.*—The same remarks apply to the supply of water in the area.

TOWN PLANNING IN A MANUFACTURING TOWN.

The planning of an industrial town or city is a far more complicated matter than that of a residential

town. From an engineering and economic standpoint a number of important matters have to be considered: some of these are as follows:—

(1) The first point to be decided is the position of the industrial area. To arrive at this one must have local knowledge—that is to say, information regarding existing trades and manufactures, and which of them is likely to develop considerably. The scheme should also be arranged for the inclusion, if necessary, of any new industries, for it must be borne in mind that the industries of to-day in some of our towns were not thought of a few years ago, and that every month fresh industries are being started, some of them, doubtless, having come to stay. The motor industry might be cited as an example.

(2) The proximity of this area, with its works and factories, to railway sidings and to main lines for the supply of the raw material, coal, &c., and for the disposal of the finished materials, is a very important matter. Land adjoining railways, rivers and canals will, generally speaking, be admirable for inclusion in a manufacturing area. In certain trades, of course, it is important that the works shall be situated where there is much water. Bleach and dye works, for example, are generally found on the banks of a river, stream or canal. These points will have to be considered fully by the engineer when planning the industrial area.

Before deciding on any particular positions for railway sidings, the engineer will naturally consult the railway officials; it is preferable that there should be a general siding leading to a number of smaller sidings. It has been suggested that it will pay a landowner in some instances "to give the land to the railway for the siding or sidings in order that engines might bring the goods nearer to the factories and yet remain upon the railway company's land."*

* "Industrial Development," by Councillor W. G. Wilkins, J.P. Proceedings of the National Advisory Town Planning Committee.

(3) The facilities for vehicular traffic to and from this area. The position of main arterial roads relative to the proposed area.

While in a residential area it adds to the picturesqueness of the district if the roads are radial in plan (and the author would strongly recommend this), in an industrial centre direct communication between the area and the railway, wharf and principal parts of the city is of the utmost importance. The connection of the proposed arterial roads with existing roads is also an important matter.

(4) The necessity for constructing any new roads leading to this area in such a substantial manner that they will carry the heavy traffic likely to come upon them. All streets of this class should be paved with stone setts laid on a good concrete foundation, and they should be wide enough to take a double tramway track.

(4a) The provision of roads for rapid and slow traffic.

Fig. 4 shows a cross-section through an arterial road leading to an industrial area, and illustrates what the author recommends as to the provision of two distinct streets running parallel with each other, but intended one for rapid the other for slow and heavy traffic. He suggests that such a provision is necessary owing to the increasing number of motor cars and other speedy vehicles using the roads. It will be seen that the footpaths are flagged—they are 10 ft. in width—and that the rapid-traffic road is constructed of tar macadam and is 30 ft. wide, while the slow-traffic road is paved with setts and is 34 ft. wide, a 6-ft. refuge or footway dividing these two roads. The total width of the street would be 90 ft. It is not suggested that trees should be planted in such a street. Some have recommended that the width of the main arterial streets should not be less than 100 ft. or even 120 ft., but the author sees no reason why they should be of this great width.

Section of Bridlington Town Planning Scheme.

(Plate 2.)

(5) The area to be occupied by workmen's dwellings, and the proximity of this to the industrial area.

There is a difference of opinion regarding the best position for the houses of the workpeople. Some maintain that these houses should be away from the industrial area, but situated in an adjoining housing area, while others consider the houses should be built in the same locality as the works and factories, so that the factory hands will be close to their work and will not have to walk some distance to their homes. The author favours the first suggestion chiefly on the grounds of health. Easy communication can be provided between the two areas, and if they adjoin there need be no reason why the workmen cannot get home to dinner each day. Larger gardens can be better arranged for if the houses are in a separate area, and the fact of the dwellings being away from the works has a tendency to enable the factory hands to forget their daily avocation after working hours.

The author certainly favours keeping the works and the people apart. If the factories are on one side of a river and the houses of the people on the other, ample provision should be made by means of bridges for easy communication between the two sides.

(6) The supply of electrical energy to the manufacturing area for power and lighting purposes.

This is an absolute necessity in an industrial area. The use of electricity for power purposes is becoming more and more common, and from a smoke nuisance point of view this is necessary, for in many cases the proposed industrial area will be adjacent to a residential area.

If the electricity supply of a town or city is in the hands of the corporation, the electrical engineer should be asked to advise his committee to obtain, if necessary, powers to extend their area of supply so as to include this proposed industrial area. Cheap rates for power and lighting purposes should be offered to the factory proprietors to induce them to take the current.

(7) Whether water carriage is available, and, if so, the position for wharfage upon rivers or canals must be selected, and the estimated cost ascertained.

(8) Provision of water and gas. It is necessary to consider the advisability of supplying water power in an industrial area.

(9) Efficient sewerage and sewage disposal system.

(10) The disposal of storm water.

(11) That the area is sufficiently large to allow of ample provision being made for the future development of the various industries.

(12) In deciding the position of the proposed industrial area, the prevailing winds should be taken into account, and the area selected should be one so situated that the prevailing winds will carry the smoke away from the residential area.

(13) The advisability of constructing subways under the main arterial roads to accommodate gas and water pipes telephone, telegraph and electric cables, hydraulic mains, compressed air and sewer pipes.

This, in the author's opinion, is a matter which in this country has not received sufficient consideration. The present method of laying sewers, water mains, gas mains, &c., under our streets is altogether unsatisfactory. These streets are continually being opened for the purpose of connecting to one or the other of these, and this constant opening of the principal roads is an intolerable nuisance, while the reinstatement is not always satisfactory, and leads to a great deal of correspondence with the departments concerned relative to the unsatisfactory reinstatement of trenches.

The construction of a subway is the remedy, and the author recommends this, but, owing to the cost, he would build the subway in the main arterial streets only. Fig. 5 is a suggestion he makes as to the type of subway that might be built. Reinforced concrete he considers to be an ideal material to use in a structure of this kind.

(14) *General.* In the industrial area might be included refuse destructor works, tramway depot, car sheds, abattoirs, ice factory and cold stores; it is always best to group these together, and to place them as far away from the residential area as possible.

(15) The construction of tramways or light railways in the area is also a matter of consideration.

(16) Folly of limiting the height of buildings. If the maximum height of the building which will abut on the new street is specified in a town planning scheme, the owner of the land will be almost sure to build to that height, considering it more economical to do so. If it be [illegible] buildings that are allowed and not higher, then there is a danger of a monotonous row of four-storey buildings being erected, whereas a variation in the height of the buildings will be preferable.

(17) Having decided the industrial area, the residential area must then be chosen, and the developments of this will proceed on the lines already indicated in the first part of this paper.

Brief Description of Bridlington's Town Planning Scheme.—The author will now, in conclusion, give a few particulars regarding the town planning scheme which the Bridlington Town Council have under consideration.

The area proposed to be included in the scheme adjoins the town on three sides, and comprises some 2,805 acres, the total area of the borough being 2,751 acres. About two-thirds of the area proposed to be laid out is outside of the borough and in the rural district council's area. To avoid any opposition from them in this matter the town council have taken the wise course of asking their co-operation in the preparation of this scheme by the appointment of three members of the rural district council to attend the Town Planning Committee's meetings and tender their suggestions; the rural district council have agreed to this proposal.

It is not intended to proceed at present with the detailed plan, showing the whole area laid out as streets, building sites, parks, &c., but to do this in sections, the first of which to be planned is that shown on Plate 2. There is no need for the author to describe the laying out of this area, as the plan explains itself; he would, however, state that at present the area consists of fields, the land being worth from £60 to £100 per acre. The width and method of construction of the proposed roads is shown in Figs. 1, 2 and 3. The sewerage of this area has already been referred to; the gas company have power to lay mains within the area, and the corporation have power to supply water and electricity. If the area is laid out by the landowners in the manner shown on the plan, the land will be converted into building land worth from 7s. to 10s. per super. yard. The corporation are hoping to obtain land free for the laying out of the parks, recreation grounds, &c., shown on the plan. The area of this first section is 175 acres, and twenty-five workmen's dwellings are about to be erected on part of it (see Plate 1).

The author has endeavoured in this paper to point out the extent to which town planning affects the engineer. Landowners are welcoming the adoption of town planning throughout the country, as they find that if their land is left outside the area proposed to be laid out it may be undeveloped for years. Local authorities on the other hand have now the opportunity of extending their towns on modern lines, and so making the England of to-morrow a country of beautiful cities with open spaces and wide streets. Many authorities have already taken advantage of these opportunities, and have prepared town planning schemes, many others are now doing so, and it is the opinion of the author that in the near future there will be scarcely a town in this country of any importance that has not its town planning scheme in hand. In order to ensure the best results it is necessary in this matter that the engineer shall co-operate with the architect, and that the one shall appreciate the work of the other. Great tact will also be required in dealing with landowners and other interested parties, and experience has already shown that the landowner is not, except in obscure cases, an unreasonable man to deal with, and that if it can be made clear to him that the development of his land on town planning lines will be a great advantage to him, he will be found willing to co-operate with the local authority, and, if necessary, give up to the authority pieces of his land for street widening, provision of open spaces, &c. Many landowners have done this, and have become most keen in town planning.

DISCUSSION OF MR. MATTHEWS' PAPER.

At the meeting of the Society of Engineers at which the foregoing paper was read on Monday evening the chair was taken by the president, Mr. John Kennedy.

Mr. Ebenezer Howard (Letchworth) remarked that the author's paper divided itself into two sections, as though those two sections embraced the whole possibilities of the case. There was town planning in relation to a residential district, and town planning in relation to a manufacturing town; but he (Mr. Howard) suggested that there was a third type which was little thought of at the present time in this country, but which would be considered to a large

extent in the future—*viz.*, town planning in an open, agricultural area. The largest town planning scheme at present being carried out on these (open area) lines was at Letchworth, which embraced an area seven times as large as the walled-in City of London; it was now 4,500 acres in extent. There they had a case of town planning *ab initio*, just as when they built a building. Town planning in its primary idea was to build the town, and not to build additions to other towns. If he could add anything to the paper it would only be on one point—*viz.*, that at Letchworth they had to make such provision as regarded roads as would enable them to be widened at comparatively little expense. With respect to the roads they had constructed there, their experience had shown that grass margins were more suitable when a road was not a wide one. It was a good thing to allow the tenants to utilise the space with the condition that if the road required widening the land should be given up for that purpose. It might be of some little interest for them to know, if they did not already know, that with regard to a large area at Letchworth they dealt with it from the point of view that where there had been a purely agricultural district there would grow up a considerable town with a large number of industries. Naturally they selected a site near to the railway, and there had grown up a very large number of important industries. As to the question of the housing of the people, whether it should be adjacent to the works or not, that was decided on the lines that they should, as far as possible, have to set aside a large part of the estate for factory purposes, and also set aside land adjacent for workmen's dwellings. Originally they had 400 people; now there were 8,000, and a considerable number of the workpeople could go home to breakfast and the mid-day meal, and also be able to reach recreation grounds within a few minutes of their work. That was the only method of building a new town, and he hoped engineers would recognise that, as at Letchworth—which was known at one time as the wilderness of Hertfordshire—there were latent possibilities in the millions of unoccupied and unused acres, possibilities for the creation of healthy, beautiful, and useful towns which would rival in a perfectly healthy and natural way the old towns, so that rivalry would tend to produce better results in the old and new towns. It was evident from the author's plan that he did not contemplate putting forty cottages on an acre, or any number of that kind. If any town council were to proceed upon such lines (putting forty cottages upon an acre), though it might make immediate profits, it could only be done by putting up houses which would soon be out of date, and in which no self-respecting workman would consent to live.

Mr. Holroyd Smith said that in America town planning proceeded upon the system of dividing the city into squares. This had its conveniences, but it presented a difficulty in proceeding in a diagonal direction. He would suggest, therefore, in order to avoid that drawback, that the basis of the new town should not be squares, but hexagons. By this means direct locomotion would be improved, and the public convenience would be consulted. The speaker alluded to what he termed the absurdity of road surveyors constructing roads with an oval camber, which tended to collect all the mud at the sides of the road. He maintained that the road should slope from both sides to the centre. Mr. Smith also advocated the construction of subways for service mains, and a system of dealing circularly with the traffic at congested points where various streets converge.

Mr. C. T. A. Hanssen stated that the kind of road suggested by the last speaker was in use in St. Petersburg, and his experience was dead against it. The water that flowed in the street did not come from the street itself, but from the adjoining houses and courtyards. If the gullies were at the sides of the street the water was got rid of very quickly, but with the gully in the centre the water flowed all over the road, and the sides became very muddy. Labour was very cheap in St. Petersburg, and, in spite of the large numbers of roadmen, considerable pools of water formed in the streets. The remedy to be applied to our roads in this country was to diminish the camber. As to town planning, he objected to the centralisation of people in factories, and suggested that work should be carried on in the detached dwellings of the workmen, with properly organised means of transport and communication.

Mr. W. B. Esson alluded to the Hampstead town planning scheme as one of the most remarkable he had seen. There was another at Beckenham, which, to his mind, was better than Letchworth.

Mr. E. H. J. Brewster remarked that the Metropolitan Board of Works constructed a subway for underground pipes on the Embankment, but the cost was very great—so great as to be prohibitive of general application. He agreed that they might have roads too wide, and consequently too expensive to maintain, and as to materials, he thought small cubes of granite might be placed on a road with light traffic, but not where the traffic was heavy. He was in favour of limiting the height of buildings, but not in favour of making a compulsory given height.

Mr. R. W. A. Brewer supported Mr. Holroyd Smith in what he had stated with respect to the road surface. The camber was generally excessive, and was the constant cause of accidents. It seemed to him that surveyors who made themselves responsible for the roads could not be road users themselves. The solution of the traffic question was to adopt the Paris system by restricting slow traffic to the sides and relegating fast traffic to the centre of the road.

Mr. Brewster suggested that the society should communicate with the Road Board or the police authorities with respect to the choice of a circular system of dealing with traffic where, say, four roads met.

Mr. W. R. Davidge (district surveyor, Lewisham) said that to adopt the system of traffic distribution proposed by Mr. Brewer would be to create a perpetual wall of vehicles which it would be difficult to penetrate. He considered that architects and engineers might well give a mutually sympathetic consideration to the question of town planning.

Mr. W. Louis Carr (surveyor to the Ruislip-Northwood Urban District Council) stated that the allocation of the town planning area at Ruislip-Northwood given by Mr. Matthews needed slight correction, and might be given in the following form: The scheme out of an area of 5,690 acres allocated the following acreage for various purposes—factory sites (optional), 110 acres; shops and business centres (compulsory), 54 acres; shops and business centres (optional), 200 acres. These were spread over the district as considered advisable. On the remainder of the area public and private open spaces, lands appropriated for special purposes, and dwelling-houses were to be erected. With regard to the specification for making up main arterial roads, at what period of development did the author suggest this should operate? He assumed not until after building operations had taken place. If he was correct he should like to know the suggestions as to how much Mr. Matthews would require from the estate developer in the first construction of these roads. To carry out the specification in the first instance would, in his opinion, be a waste of money, and he did not think many owners would consent to such a lay out. As to subsidiary roads, had the author any objections to, say, 20-ft. streets in certain cases, or 10-ft. round quadrangles which led off a 40-ft. street? He would also suggest that at certain distances 24-ft. turning places were required in carriageways of 16-ft. width. He should like the author's views as to how many houses under one roof he recommended. With regard to the statement that wider roads added to the value of abutting property, he did not think this was always the case.

Mr. Matthews, in reply to the discussion, said that with respect to the question of Mr. Carr as to the period when the roads should be made according to the specification, he would suggest that this should take place when the whole of the buildings in the area had been completed, at any rate the whole of the buildings abutting on the roads. Mr. Carr suggested that in certain cases a width of road less than 30 ft. might be provided for. He (Mr. Matthews) agreed that in a quadrangle a road 20 ft. or 24 ft. wide might be sufficient. As to the number of houses under one roof, he thought it was preferable, as far as possible, to limit it to two. Then with respect to the statement of wider roads adding to the value of the abutting property, which had been questioned, it seemed to him to be so. Mr. Brodie, in a letter, had referred to the German method of purchasing land. The German method, he thought, was a far better one than ours. They could buy up land, lay out their land, and sell what they did not need. Mr. Brodie referred to the advisability of a corporation buying up land that they might require for widening purposes, and allowing residents to utilise part of it until such time as it was required. He (Mr. Matthews) did not like the idea of private owners fencing in corporation land. At best the fences would be temporary, and

probably an eyesore. The borough engineer of Yarmouth, in another letter, referred to some interesting points. He agreed with Mr. Whyatt that many local authorities were not doing as much as they ought to do owing to the fear of involving the town in some expenditure, thus retarding them in taking up the Town Planning Act or doing justice to it. Mr. Whyatt thought he (Mr. Matthews) had made too high a standard for the road making. Personally he did not think so; he thought that the width and method of construction he had described were suitable for the conditions he had mentioned. He agreed that a healthy town meant a saving of money. In Bridlington they had spent over £50,000 in road widenings, and if their town had been built on town planning lines that money would have been saved. Mr. Matthews thanked Mr. Howard for his interesting speech, and proceeded to state that the number of houses per acre in his scheme was twelve. He expressed his belief that the circular system of road traffic would be an improvement, and as to some remarks by Mr. Brewster, he added that he thought it would be a great mistake to roll the bed of the road, especially in certain soils.

A number of letters discussing the paper were sent by correspondents who were unavoidably prevented from attending the meeting.

Mr. John S. Brodie (borough engineer of Blackpool), wrote: "I agree with most of the suggestions made by the author, whom I congratulate on the clearness and brevity of his paper. There are, however, a few details which I trust the author will excuse me for offering a little friendly criticism on. To a certain extent the architectural aspect of town planning must of necessity take precedence over the engineering standpoint, and, within certain limits, the engineer will step in when the architect has completed the rough outline of his plan, just as, in the architect's design for a great building, the engineer can be usefully invited to confer on details which of necessity he must be more familiar with than the architect. The contour of the ground must to a large extent govern its laying out, and such questions as main drainage must, of course, be left to the engineer. The author suggests three classes of roads. I have for many years used six standard forms of roadways in Blackpool, so that such type of roadway may be adapted to the economical conditions for the development of the land, which are, after all, paramount in any well-devised scheme of town planning. Referring to the cross-sections in Figs. 1, 2 and 3, I am much more inclined to have wide spaces between building lines than grass margins as part of the roadway, except in special cases where they can be well looked after, as such margins tend to become untidy and depressing. I cordially endorse the remarks made in the paper as to the cost of construction. The benefits of ultimate wide arterial roads can quite easily be secured for future use by authorities acquiring land for highways of an ultimate width of 60 ft. to 100 ft., and allowing the abutting owners in the meantime to enclose in their front gardens or lawns so much of the ultimate width required as is not necessary for immediate road purposes; and it will be found that in many cases a 36-ft. roadway of 21-ft. carriageway and two 7-ft. 6-in. footpaths will be found ample for present purposes, and the land for future widening being secured, the expenditure on such future widening can be deferred until the volume of traffic warrants it, and should then be borne by the community, and not by the abutting owners. The proposed town planning adjoining the author's district appears to be well laid out for residential purposes. It is, however, always open to discussion as to whether the German method of purchasing the freehold of land immediately adjacent to the town area—a method adopted at Blackpool with much success for some years past—is preferable, so that the municipality reaps the advantage of the increased land values rather than the individual landowners."

Mr. H. Gilbert Whyatt (borough engineer of Grimsby) wrote that he had been greatly interested in the statement of the town planning problem as laid before the meeting by the author, inasmuch as the method of stating the case applied so closely to the conditions in Grimsby. A portion of the county borough which the corporation had in mind as suitable for a town planning scheme was on the verge of a district entirely residential in character; but at the same time it was certain that provision would have to be made for factories. The question had been discussed recently as to whether it was desirable for a local authority which was practically entirely residential, as one imagined Bridlington to be, to include the whole area of the borough in its application, so as to limit the erection of works and factories to one particular area in the town, or to exclude them altogether; but it would appear that even if such a scheme received the approval of the Local Government Board the law could not compel the owner to use a building as a residence, and to plant the garden with flowers and shrubs. It was quite open to him to use the house as a workshop, and the garden as an ugly store yard in connection therewith, provided the house could be made convenient for the purpose without the erection of additional buildings. Even the erection of additional buildings could not be prevented if constructed as stables, coach-houses, granaries, garages, &c., and used without alteration for the purpose of the factory. With regard to the question of a local authority paying for the extra width of road over that required by the by-laws, this could only be done to any great extent by a local authority which had a very high rateable value. The usual period for a loan allowed by the Local Government Board for road construction was eighteen or twenty years, and the annual payment was respectively £7 14s. 9½d. or £7 3s. 11d. per cent, which would have to be borne by the rates; while, on the other hand, with a reduced number of houses per acre, the local authority would have a less income from the estate. The real offset was a reduction of the death-rate. In the case of the landowner, he received a less ground rent owing to the restrictions placed upon the area and the limitation of the number of buildings per acre, but at the same time his expenditure on the construction of streets was less, and, taking the two, he suffered no financial loss. The writer ventured to disagree with the author as to the construction of a subway on the lines indicated in Fig. 5, except in so far as it tended to reduce the number of longitudinal trenches in a road. The latter were not very numerous, only occurring when it was necessary to lay a new main, and only recurring when enlargements of the extensions become necessary. The cross-trenches were the most numerous and the most exasperating, for no sooner had a road been thoroughly repaired than it was cut up a dozen or more times within six weeks to make connections of various sorts. To have a subway as sketched by the author would be to increase the difficulties; now, the electricity cables, and often the gas mains, were laid under the footpaths, and the cross-trenches were very short; they would all be the same length under the scheme, and would always cut up the roadway. Again, all drain connections would be very difficult to carry out and to supervise with the substructure in the way, and the limited headroom below the concrete carrying the gas and water pipes. Assuming one side of the subway to be east and the other west, there were difficulties in connecting the water and hydraulic mains, and the telephone and electric cables on the east side with the buildings on the west; and conversely connecting the gas main, compressed air main, &c., on the west side with the buildings on the east side of the street; but to an engineer these are not insuperable. The author's scheme for a town planning area as shown on Plate 2 appeared to be an excellent and very well designed solution which one might hope would be carried out.

Mr. J. W. Cockrill (borough surveyor of Great Yarmouth) wrote: "In my opinion one of the great features of Mr. Matthews' paper is to show that the engineer will be indispensable in carrying out any scheme of town planning, and that the engineer will be the corporation or district official with his knowledge of the needs and difficulties of his locality. With the plans of his district made up to date he is in a position at any time to commence the preparation of a scheme. The work of town planning is unfortunately retarded by the position taken by the local authorities, who, with their fear of the ratepayers and the large amount of unavoidable expenditure to which all towns now stand pledged, will not incur any expenditure. This is to be deplored, and any attempt of an official to make a scheme costly or to bring in outside help would wreck its chance of being proceeded with in more than half the towns and districts where the matter is now being discussed. So much of Mr. Matthews' paper is the outcome of real practical experience in his own district, and it cannot be controverted. Town planners will, however, urge that he is insisting on too high a standard for the road making. The estimates given are low for the work proposed, and could not be executed for the money in all parts of the country.

It will also be urged that the plan (Plate 2) is wasteful in space occupied by the roads, and that the sections of the roads given are unnecessarily costly: but from the point of view of the official, who will have to maintain them and to meet his council for years after they have been adopted, it is necessary that two items should be carried out—*viz.*, that the footways should be paved and that the grass margins should be kerbed. An attempt to do without these would in a very short time lead to the residents demanding a paved footway, and the sorry plight to which the grass margins get reduced if no kerb is fixed soon necessitates that the whole path should be paved, and as in most cases on the completion of the road they become "adopted roads," the expense falls on the ratepayers, and the official who accepted the work in its unfinished state is soon in hot water. In these matters, however, Mr. Burns' Town Planning Act gives the opportunity of negotiating with the landowners, and the following quotation from a paper read by Councillor W. G. Wilkins, J.P., at a meeting convened by the Housing and Town Planning Council in London in April last gives, in my opinion, a strong reason for the local authorities proceeding with a scheme: 'The Housing and Town Planning Act gives remarkable facilities for the making of bargains between local authorities and landowners, and the extent to which the Act is used will largely depend upon the extent to which those interested in the land meet those interested in civic progress in friendly co-operation for mutual benefit.' Anyone who has had to deal for any length of time with the development of a town sees in the Act a means of saving money to the ratepayers, in the health of the town and in the cost of street improvements which would have been unnecessary if a wise forethought had been used at a time within the memory of persons taking part in the transactions. The by-laws in force in most towns frequently come in for a large share of hostile criticism by town planners and a section of the public, especially in their result on the planning of corner houses, and in the question of drainage. As to the first, the experience of what has been done by architects and builders in overcrowding sites where there have been no by-laws controlling this matter gives no encouragement to the relaxations of this by-law, and in the second item, until the law is altered which provides that each house must have its separate drainage, local authorities will not be prepared to accept the responsibilities involved in giving way on this point. Other by-laws considered as involving curtailment of architectural effect and use of materials, might be allowed to drop, but at the present time most local authorities are open to admit anything reasonable in a well-designed and substantially constructed building."

Mr. Sydney H. Morgan (surveyor to the Prestwich Urban District Council) wrote: "The engineering aspect of town planning is of primary importance, and the municipal engineer is particularly fitted by his training and local knowledge to deal successfully with it. The ultimate success of a scheme depends on the soundness of the engineering principles underlying it. Mr. Matthews has dealt with his subject in an interesting and lucid manner, and deserves the gratitude of all engaged in the solution of the problem of town planning. The author urges tar macadam as a suitable method of construction for main arterial roads in a residential district. I am not sufficiently acquainted with the conditions at Bridlington to express an opinion as to the advisability or otherwise of this method in that particular instance, but as a general policy I cannot agree with the author of the paper. In Prestwich there are some very fine *residential* roads of tar macadam. Tar macadam is not suitable to main or even secondary road traffic. With heavy traffic—and a main arterial road must sometimes have heavy traffic—the surface is liable to wear unevenly, and it is most difficult to repair neatly. Granited rock asphalt laid on a bed of concrete would fulfil Mr. Matthews' conditions as to dust and noise, while at the same time showing greater wear and tear. Mr. Matthews deals with an arterial road in an industrial area. Here again I dissent from his recommendation that the fast traffic roadway should be constructed of tar macadam. A double tramway track will certainly be necessary on an arterial road, but the author does not appear to provide for it. Would he place it on either of the roadways shown on Fig 4, or on a separate portion of the road? In the case of subsidiary roads I would go further than the author both as regards width and mode of construction. Where the road is so designed that it will not be used by through traffic, but only as an approach to a few houses, 20 ft. or 24 ft. in width might be sufficient provided the houses on both sides were well set back. Trees, instead of being planted along the footways (as shown on Fig. 3), where in so narrow a street they become an obstruction, may suitably be planted just inside the gardens. In this manner both the minimum width of road and the pleasing avenue of trees are secured. Tar macadam in such a street seems unnecessary expense, and granite or whinstone macadam on a good foundation would meet all the needs of the case. There are many points in this suggestive paper which it would be interesting to discuss, but I should like most sincerely to express my gratitude to Mr. Matthews for his contribution to a subject which is daily growing in importance."

Mr. A. H. Campbell (city engineer of Edinburgh) wrote: "The paper submitted by Mr. Matthews is eminently practical. It deals with a subject of much importance to engineers, especially that branch of engineering represented by the author. The orderly development of cities and other centres of population has for long engaged the attention of municipal administrators, and at last the all too tardy powers conferred by the Town Planning Act open out a new scope for the engineer, and demanding the exercise not only of engineering skill, but of those not less indispensable talents of common sense—persuasive force and patient plodding—that are most certainly required to carry through a town planning scheme against a great variety of conflicting interests. For, consider what this new power is. It is the statutory declaration that no longer is the landowner master of his soil, but that it is held in trust for the common good; and in the use and development of his land he shall subordinate self to the general interests of the whole. This is an important advance in the realm of municipal economy. But if it confers such comparative absolutism upon the local authorities this very power calls for the exercise in its operation of justice tempered by prudence, and consideration as much for the reasonable rights of the individual as for the common interests of the people. And if the scales of justice are thus evenly balanced, then there is little fear for the success of town planning schemes in the neighbourhood of civic life. Now as to the concrete application of these observations as it bears upon the engineer. I do not find that Mr. Matthews has dealt very much upon that all important part of the preliminary survey work known as 'the altitude survey,' commonly called 'the contour' of the area. If the land be uneven, hilly and of undulating surface, a correct contour at every 5 ft. to 10 ft. vertical levels is an absolute necessity, and I should have liked to hear this part of the process enlarged upon by the author in that way, of which his writings in other engineering subjects show him so capable. For there is no question of the imperative need for this at the very outset of the plan, and it seems not to have had that attention which its importance demands as a purely engineering part of the work for evolving a good town plan. The methods to be followed, the engineering survey instruments to be used, and a general exposition of this foundational work, would itself be of the utmost use and interest to the Society of Engineers. One other feature of a good town plan is the importance of good vistas. In the disposition of the roads, the grouping of the buildings, the introduction of landscapes, there should be developed that artistic sense that delights in terminal features to the leading avenues, so that they do not convey the idea of disappearing in space. Probably nowhere is that pleasing feature of a town plan better exemplified than in the city of Edinburgh, where the designers of the New Town have laid hold of this idea in the artistic perspectives that present themselves—as if by nature—at every turn of the road. Engineers should endeavour to utilise the means open to them of embodying this attractive feature in the plans they prepare. The proposition advanced in the paper that the routes of roads are determined chiefly by considerations of drainage is one that I cannot accept; there are other elements of not less importance, as, for instance, convenience between given points, the positions of railway stations, the transit question, the securing of vantage points, which should influence the disposition and direction of roads. Drainage, we know, is vital, but engineering science can make it subserve the plan instead of allowing it to dominate and determine everything else. The locality of the industrial area is another part of the plan that introduces controversy. Nowadays, when electricity is so cheap and power is

L

readily obtainable from a common generating centre, I see no reason why factories of good design, becoming elevation, and driven by electric power, may not be planted in the midst of habitations of the working classes, so that the advantages inherent to this combination may not be sacrificed upon the altar of prejudice begotten of other days when smoke and ugliness were the inevitable accompaniments of a factory area."

THE CLEANING OF WATER MAINS.

SUCCESSFUL WORK IN NOVA SCOTIA.

A paper read by Mr. F. W. W. Doane, city engineer of Halifax, Nova Scotia, before the Union of Canadian Municipalities at Windsor, Ontario, contains some important particulars, including prices of the cleaning of water mains. These particulars are of special value as they are the result of long experience and annual practice, for we are told that the incrustation of the mains has been removed annually in the city of Halifax for the last thirty-three years, a mechanical scraper driven forward by the pressure of the water having been used.

It appears that the incrustation in the Halifax mains is due to the formation of a coating of oxide of iron, which forms tubercules or blisters between which a ferruginous slime forms, so that the carrying capacity of a pipe is sometimes reduced by 50 per cent.

THE SCRAPING MACHINE.

The scraper which is used to remove this incrustation consists of two portions—*viz.*, the front part carrying the steel scrapers and the rear part, upon which the water pressure acts in order to propel the machine. There is a steel centre rod of wrought iron made in two pieces, which are coupled together in such a manner as to allow sufficient play to permit the machine to pass round bends in the pipe. The cutter or scraper has eight arms made of spring steel, varying in width and thickness according to the diameter of the pipe; these blades are arranged in two sets of four, so that the set behind break joint with those in front. Each of these arms has a cutting edge arranged so that it will cut or split longitudinally any heavy incrustation. Each blade is tapered, so that it forms a barbed knife working point backwards. The use of this shape cutter makes it impossible for the knife to catch in any valve or defective joint in the pipe. Also if the knife encounters a ferrule or similar obstfuction it will cause the scraper to revolve and thus to pass the obstruction without getting blocked, or, failing this, the spring-like knives will yield sufficiently to enable the scraper to pass.

The machine is propelled by means of discs upon which the water presses. Double discs are provided in order to ensure steadiness. These discs are made of iron, and are smaller in diameter than the bore of the pipe, so that water can pass them to wash out the scrapings. The iron discs are backed with leather discs intersected with radial cuts and stiffened at the backs with plates of lead. Thus their construction gives sufficient stiffness to withstand the pressure of the water one way, and yet allows the discs to yield backwards sufficiently to pass any obstruction not removed by the cutters. Small springs are attached to the backs of the iron discs in large sizes in order to maintain the machine exactly in the centre of the pipe. Rings are attached at each end of the centre rod for convenience in handling.

PROCESS OF CLEANING.

In cleaning a main a section of pipe is removed at each end. The machine is then inserted, and the section of pipe replaced at that end, and the water is then turned on. The scraper then starts making a noise in its progress by which it can easily be followed. The rate of speed varies from ¼ mile to 6 miles an hour, the speed depending upon the water pressure and the gradient of the pipe up or down hill as the case may be. Hydrants or wash-out valves are left open.

COST OF CLEANING MAINS.

It appears that in the city of Halifax the greatest length of pipe cleaned in one day consisted of a main of two sizes, 15-in. and 20-in. diameter, and 7 miles long. The first cost of cleaning the mains over thirty years ago averaged 1¾d. per foot, the lowest costs being 8¾d. and the highest 3·6d. per foot.

Twenty-one thousand five hundred feet of 15-in main have been cleaned in ninety-five minutes at a cost of £1 14s. 7d., or ·0142d. per foot run. The lowest head operated under was 11 ft., but it is only possible to work with this low head when experienced men are employed. The cost for recleaning supply mains during twenty-five years has been 1·32d. per foot, and on one occasion they were cleaned for 1·40d. per foot. The cost of cleaning distribution mains varies from 1·20d. to ¾d. per foot, while the cost of hand cleaning before a mechanical scraper was used was 7·1d. per lineal foot.

It is obvious that the saving of cost in relaying mains and the improvement in supply and pressure is great where mains are treated in the manner described in Mr. Doane's paper.

MOTOR 'BUS TRAFFIC IN THE METROPOLIS.

HACKNEY BOROUGH ENGINEER'S REPORT.

According to a report presented by Mr. Norman Scorgie, M.Inst.C.E., borough engineer, the number of miles per annum travelled by motor omnibuses in Hackney is no fewer than 2,202,520. A census taken in the borough last August showed that in a day of fourteen hours 7,324 mechanically propelled vehicles passed five important points, an average of 523 per hour. Of these 5,527 were motor omnibuses.

Mr. Scorgie reports that roads which until the advent of motor traffic were in good condition are now having their surfaces destroyed and their foundations disintegrated, while others have had to be remade entirely with more lasting materials. Where this has not been necessary up to the present time, it has been found that the usual life of the road has been curtailed even to the extent of 25 per cent. Foundations of Portland cement concrete, which were sufficient a few years ago, are now quite inadequate, and in all renewals where defects have been found and in new work undertaken the foundations are now increased in depth by 50 per cent.

From 1906 to 1909, the borough engineer states, the cost of repairs to certain wood-paved roads averaged £86 per annum. From 1909 to 1912 the annual average was £1,047, and between April 1st and August 31st of this year the cost had already amounted to £813. In addition, roads which would have lasted years longer under ordinary traffic have had and will have to be renewed. In Stamford-hill, Kingsland-road and Victoria Park-road £1,900 is for foundation renewal out of an estimate of £7,350.

Mr. Scorgie further mentions large sums which have had to be expended on macadamised roads owing to the motor-omnibus traffic, and finally points out that the only contribution made up to the date of the last published report by the Road Board to the extra cost of maintenance of London's roads has been £1,287, although the London General Omnibus Company alone pays the board £65,000 per annum. He calculates that, on the basis of ·3d. per mile, the tax paid on petrol used by the motor omnibuses of the London General Omnibus Company running within the borough amounts to £2,750 annually.

Municipal Undertakings of Birmingham: Pit Mounds Utilisation. With the *Times* of the 2nd inst. was issued one of the remarkable special supplements which it publishes occasionally. The subject to which it was devoted was "the second city of the Empire," one aspect of which—the "Municipal Undertakings of Birmingham," to which five columns were devoted—has a special appeal for Surveyor readers. The section dealt with the city's water, gas and electricity supplies; tramways; and drainage works. Another article of great interest records the excellent work of the Midland Reafforesting Association, part of whose aim is to utilise the dreary waste of the Black Country for the planting of hardy, quick-growing trees of proved economic value, such as the poplar, willow, ash and sycamore. The West Bromwich Corporation have, with the approval of the Local Government Board, agreed to let to the association for this purpose, at a nominal rent, upon lease for twenty-one years, certain pit mounds on the south side of the town, the first public recognition of the association by a corporation as a proper authority to deal with the afforestation of waste lands. We echo the hope expressed in the *Times* that this example may be followed by other corporations which possess waste lands.

Sewage Disposal by Oxidation Methods.

By GILBERT J. FOWLER, D.Sc., F.I.C., Consulting Chemist to the Manchester Corporation Rivers Committee; Lecturer in Sanitary Chemistry, University of Manchester.

[The paper reproduced herewith was submitted at the recent Fifteenth International Congress on Hygiene and Demography at Washington. A companion paper, by Mr. J. D. Watson, M.Inst.C.E., chief engineer to the Birmingham, Tame and Rea District Drainage Board, appeared in last week's issue.]

The scientific solution of the sewage problem will not be attained until the following results can be guaranteed for any given case:—

(1) An effluent which will not deteriorate the stream into which it flows.

(2) No nuisance in the course of sludge disposal.

(3) No nuisance from smell or from flies in connection with the filter-beds.

(4) An expenditure strictly proportionate to the sanitary and æsthetic results achieved.

Those of widest experience will be the least ready to say that these criteria of success are at all commonly fulfilled.

It may not be uninstructive briefly to consider these four directions of effort, with the object of seeing what has been satisfactorily accomplished, and what yet remains to be done.

EFFLUENTS.

The success of a works is most frequently judged entirely by the effluent produced, generally in accordance with some more or less recognised standard of purity.

The question of standards is too large a one to enter upon here more especially as the Royal Commission on Sewage Disposal is shortly expected to issue a report upon the subject.

Taking a broad view, it is probable that the criterion of purity suggested above—*viz.*, an effluent which will not deteriorate the stream into which it flows—is a comprehensive and practical one. It allows for some advantage to be taken of dilution, if the volume of the stream be large in proportion to the volume of the effluent; it ensures an automatic speeding up of authorities down stream, as those in the higher reaches, who have the initial advantage of clean water, do their duty; it is, in fact, in accordance with the judgment in the famous recent "Birmingham *v.* Tamworth" case.

The principle of judging an effluent by its effect in the stream into which it flows has many advantages. It is exceedingly difficult to obtain a true average sample of the effluent from any sewage works. Conditions vary from day to day, and, indeed, from hour to hour. Land areas may have been recently ploughed, and the effluent for an hour or two may be distinctly unsatisfactory; a sudden storm may push strong tank effluent through filters at a rate too great for efficient purification, or over the storm overflows without any treatment. Unless systematic sampling at short intervals is undertaken, either as part of the work of the staff or by means of mechanical devices, many of these incidents will escape notice. Snap samples often give, on the other hand, either too good or too bad an impression of the character of the effluent.

But the character of the stream below the outfall is a permanent and, on the whole, a fair witness. Where gross obvious pollution is not in evidence, a body of knowledge is being obtained of the various forms of life which indicate good or insufficient purification. It is surprising how a small amount of unbroken-down organic matter in an otherwise well-mineralised effluent will encourage the growth of masses of fungus.

The idea of the fishpond as an extra line of defence before the final discharge of an effluent into a stream, which has been successfully applied at many places in Bavaria under the direction of Prof. Hofer, is well worthy of careful study.

A consideration of the effect of an effluent on the forms of life and growth in a stream leads to the important question of disinfection, a subject which has recently been so ably dealt with by Prof. Phelps.

There is one point which has, in the writer's opinion, not been sufficiently studied in this connection—*viz.*, the possible effect of sterilising agents on the micro flora and fauna of the stream, other than bacteria. A comparatively small dose of chloride of lime will inhibit fungus growth, as a small dose of copper will prevent the development of algæ. It is worthy of further study whether the addition of chloride of lime to an effluent in sufficient amount to reasonably protect a water supply may not at the same time upset the balance of life on which the continued healthy condition of a stream depends. Speaking generally, it may, however, be said that of the four problems referred to the problem of the effluent has been carried furthest to a scientific solution.

SLUDGE.

The sludge problem is really the centre of the general sewage problem. The method of handling the solid matter, which in some form or other has to be separated from sewage, conditions the size and character of the filters, and the main question in the design of sewage works lies broadly in the allocation of expenditure as between sludge disposal and filtration costs. Thus very perfect clarification of sewage by heavy doses of chemical renders possible great economy in filter construction and maintenance, while with adequate filter area it is possible practically to dispense with preliminary treatment altogether. How far expenditure is best incurred in one direction or another depends entirely on circumstances, and it is here that judgment and experience are called for.

CHEMICAL TREATMENT.

The Fifth Report of the Royal Commission on Sewage Disposal was by no means unfavourable to chemical treatment in a number of cases. It may be doubted whether the dilute sewages resulting from the lavish use of water in American cities lend themselves generally to economical precipitation by chemicals.

The writer has had occasion lately to go somewhat closely into the question of precipitation of sewage, and has reached the following general conclusions—*viz.*, that chemical treatment is to be recommended where the following conditions predominate:—

(*a*) Where sludge disposal is cheap.
(*b*) Where land for filters is restricted.
(*c*) Where filter construction is expensive.
(*d*) Where fall is limited for either coarse percolating filters or double contact beds.
(*e*) Where special trade refuse has to be dealt with.

Conditions (*a*) and (*b*) probably both apply in Glasgow and to a less extent in Salford. Condition (*c*) depends largely on facilities of transport, which vary within wide limits. Condition (*d*) obtains, *e.g.*, at Hanley and elsewhere in the Potteries. For shallow percolating filters of fine material, advocated, *e.g.*, by Dr. Reid, chemical precipitation appears essential as a preliminary. This is, as a matter of fact, achieved at Hanley by means of the "slip" or fine clay from the pottery works, which comes down with the sewage. Ordinary septic tank treatment is likely to be disastrous for such filters, causing rapid blocking. Condition (*e*) is exemplified at Wakefield, where, owing to the presence of wool-scouring liquors and other troublesome trade effluents, chemical treatment by lime and ferric sulphate has been adopted under the advice of the writer.

Of course, the main difficulty with chemical treatment is the disposal of the resulting sludge. Apart from its quantity, the fact that it contains a large proportion of precipitated soaps renders it unsuitable for use as a fertiliser, as it is not readily incorporated by the soil.

Should Dr. Grossmann's grease extraction process, now being tried at Oldham on a large scale, or the partial carbonisation process now being taken up by Norwich and Huddersfield prove successful, even to the extent of disposing of the sludge in a satisfactory manner without additional cost, chemical precipitation may have a more extended use than was at one time thought likely.

SEPTIC TANK PROCESS.

The septic tank has not proved altogether the success as a solution of the sludge problem that was at one time hoped, but here, as always in considering the sewage problem, it is important that conclusions

should not be too hastily drawn. The defects which have shown themselves in the ordinary septic tank process are a nuisance both from the tank effluent and the sludge, and an excessive quantity of suspended solids in the tank effluent.

THE EMSCHER TANK.

The Emscher tank, concerning which much has been written of late, seeks to remedy these defects by quickly separating the sludge and effluent. The liquid portion of the sewage passes quickly through the tank in a fresh state, while the suspended solids drop through a slot into a lower compartment, where the sludge is thoroughly digested under anaërobic conditions, the construction of the tank preventing any fouling of the effluent through escaping gases and suspended matters.

The tank certainly appears to be successful in eliminating nuisance, both from sludge and effluent, and under certain conditions has manifest advantages. The Manchester Rivers Committee has recently decided to instal a trial Emscher tank at their Withington sewage works, where the sewage is dilute and purely domestic, and the present tank space, especially in rainy weather, inadequate.

Nevertheless, it is well that certain difficulties inherent in the Emscher tank process should be pointed out.

In the first place, the comparatively short time of settlement means that variations in the character of the sewage must be quickly reflected in the character of the tank effluent, and the filters accordingly called upon rapidly to accommodate themselves to fluctuating conditions. This is not conducive to developing the most efficient bacterial activity. These fluctuations will, of course, be accentuated if trade wastes are present in the sewage. One of the main advantages of the considerable time allowed for the sewage of Manchester to pass through the tanks at Davyhulme is that fluctuations of this sort get smoothed out, to a large extent at any rate, and the filters have a more equable task to perform. In some cases large tank space may be a bulwark against possible disaster, as when on a recent occasion an acid chamber gave way at a works in the city letting out many tons of vitriol into the sewage. The strong acidity of the sewage entering the tanks was, however, nearly neutralised by the mixing with the slightly fermented sewage present in the tanks, and the filters incurred no noticeable damage.

It appears to be recognised by the Emscher authorities that storm water, at any rate above moderate dilutions, will have to receive separate treatment, and ordinary stand-by tanks would still be necessary for this purpose, the sludge from which will have to be dealt with.

In any event the suspended matters which produce the sludge in the Emscher tanks are those which settle readily, say in the space of two hours. The colloids, such as are eliminated by chemical treatment, have still to be reckoned with, and the character and extent of the filter beds designed accordingly. In many cases this may mean that fine material cannot be used for constructing the filters and the alternative adopted of deep filters of coarse material, with the possible resultant nuisance from flies, referred to later.

A third consideration with reference to the Emscher tank has been forced upon the writer's attention through a small experiment in connection with the sewage of a public institution, where it has been possible to test a small Emscher tank and an ordinary septic tank side by side. Here the sewage was very strong, and, what is even more important, very fresh. In consequence, although an effluent free from visible solids and also from putrid odours was obtained from the Emscher tank, it was found on analysis to be less broken down than the effluent from the septic tank, and less readily oxidised by the subsequent filtration process.

In the controversy between the advocates of anaerobic or aerobic methods of treatment the essential biological and chemical reactions which must take place before nitrogenous organic matter is finally mineralised are often lost sight of by reason of incidental circumstances, particularly the dilution of the sewage and its alteration during its passage through long lengths of sewer. When strong fresh sewage has to be dealt with empirical conclusions drawn from ordinary town sewage cease to hold good. This is especially so with the strong sewages often met with in tropical regions, where high temperature may coincide with restricted water supply

The writer's researches in latrine sewage in Calcutta in 1906 showed that preliminary anaërobic treatment in properly designed tanks gave better results than purely aërobic methods, and this conclusion has recently been confirmed by careful detailed experiments by Major Clemesha, sanitary commissioner for Bengal. These researches showed that the bulk of the suspended matter was best broken down in a separate inlet compartment to the tank, but that distinctly better results were obtained the longer time the whole body of sewage took to pass through the tank up to a maximum of three days.

All these considerations would tend to show that the Emscher tank may need to be supplemented by some form of equalising tank if the best results are to be obtained.

SLATE BEDS.

Some of the difficulties above indicated attach themselves to the Dibdin slate bed. The true function of this process does not seem to be very generally understood. The slate bed is not a filter in the sense of a percolating filter or contact bed, but rather an aërobic tank. The coarser suspended matters in the sewage deposit themselves, during the two hours' or so period of contact, on the surfaces offered by the slate, and are afterwards digested by multifarious forms of life flourishing under aërobic conditions. The effluent from the slate bed should be treated as a tank effluent, and filter space provided according to its strength in the usual way. In order that the filters may work to the best advantage it is probable that the provision of "humus" tanks between the slate beds and the filters is desirable. Such tanks will have the double advantage of retaining solids washed away from the slate beds and of equalising to some extent the composition of the effluent passing into the filters. They have, the writer has heard, been adopted in a recent scheme for Harpenden.

The slate bed process has undoubtedly been successful in many cases in dealing with the sludge disposal portion of the sewage problem without nuisance. The process is somewhat handicapped by cost, and by the fall needed for the slate bed as a preliminary process when compared with continuous flow tanks, where the loss of fall involved is trifling.

The foregoing section will have indicated that the character of filter to be recommended, whether contact bed, coarse percolating filter or fine percolating filter, must depend, to a large extent, on the preliminary treatment used.

There are certain sewages where almost any kind of tank treatment is bound to result in nuisance. Especially is this the case where brewery refuse is present in the sewage in any large proportion. Considerable trouble has, for example, been experienced at Stratford-on-Avon from this cause, and treatment with lime and bleaching powder has had to be resorted to in order to minimise the smell in warm weather. At Burton, after heavy treatment with lime, the sewage is pumped direct on to land.

In such cases, either the slate bed method or direct treatment on filters of the Ducat type would seem to be called for.

Successful trials have been made at the sewage experimental station at Hamburg, under Dr. Dunbar, of the use of a layer of peat over the material of an ordinary percolating filter.

The writer is at present experimenting with this method in connection with the disposal of the sewage of Market Drayton, which is particularly strong and offensive. At the adjoining parish of Little Drayton a Ducat filter has been in successful operation for many years, and has been reported upon by the Royal Commission.

FILTERING MATERIALS.

The type of filter apparently most in favour in America, and also to a less degree in England and in Germany, is the deep percolating filter of coarse material. It admits of the passage of large quantities of sewage without blocking, and eventually discharges as so-called "humus" a considerable proportion of the colloidal matter applied to it. Consequently it is, for practical purposes, everlasting. Filters of this type have been at work successfully at Accrington since 1898—*i.e.*, for fourteen years. Unfortunately, the spraying of anything but fresh tank effluent on these filters is attended with considerable nuisance from smell, and whether the tank effluent be fresh or septic, the development of insect life, particularly flies and spiders, is often extraordinary. Instances could be cited of spray jets completely blocked with twisted spider webs, of ropes of web-like scarves

rom filter to filter, of small flies nearly covering the doorway of a cottage ½ mile from the works, and so forth.

However good the effluent from such filters, and however economical their construction and maintenance, it cannot be said that such a process meets all sanitary and æsthetic requirements.

Experience shows that the fly trouble is minimised if the surface layer of the filters is of fine material, and this was one of the reasons for adopting a fine surface layer in the new filters at present under construction at Wakefield. Such a fine layer presupposes, of course, good preliminary clarification, or a somewhat restricted flow, and again the balance of advantage has to be considered.

There can be no doubt that the main advantage of the contact bed lies in its freedom from nuisance.

There have been no complaints or causes for complaint in connection with the 100 acres now in operation at Davyhulme, or with the 40 acres or so now installed at Sheffield. The cost of maintenance of these beds has not been excessive, even with a thorough washing and partial renewal of the medium every five years. Incidentally it may be mentioned that the "slurry" washed out from the filtering medium, after pressing with lime, drying and grinding, finds a ready and profitable sale for direct use as a fertiliser of moderate strength, or as a basis for the manufacture of high strength fertiliser.

The economical and the scientific solutions of the sewage problem are in reality coincident, and the more the two ends are borne in mind the more quickly the desired goal will be reached.

COSTLY APPARATUS.

It is still possible to see costly devices installed at sewage works, which a little careful scientific investigation and thought would have shown could never achieve results proportionate to the outlay. Apart from actual analysis and measurement it is easy, for example, to draw the conclusions that a special form of mechanical filter is removing large quantities of suspended matter when really either very little has been retained in proportion to the volume of liquid passing, or the volume of liquid passing is much less than is assumed.

The cost of certain mechanical distributors, including repairs and loss of lime in proportion to the quantities actually filtered over lengthened periods, was ably dealt with some years ago by Mr. Watson.

The question of the desirability or otherwise of providing costly sewerage and sewage disposal works in country districts, where it is of the first importance to spend money to the best advantage, especially in the provision of cheap houses, may well receive the careful joint consideration of the medical officer and the sanitary engineer.

In many towns in India it is at present financially impracticable to undertake fully developed Western sewerage schemes. Provisional methods have in consequence to be devised, with due reference to possible complete schemes in the future. Development on such lines may be wisest for many country villages or undeveloped towns.

The harmless return of excreta to the soil is subject, of course, to scientific principles, just as the more elaborate methods of the modern sewage works, and it is well that the interest of these latter should not entirely divert attention from the study of more primitive, but still frequently necessary, methods. There is need for careful investigation of the rate of change of suspended and colloidal matter in sewage under different conditions. Closely connected with this question is the large field of research into the conditions of life of the various organisms in sewage works from bacteria to leeches, and their relation to the sewage purification process and to each other.

Thus it will be seen that while in a limited sense it may be stated that the sewage problem is solved, in that the general principles, according to which offensive organic matter can be mineralised, are now fairly well known, their detailed application will afford work for the engineer and biological chemist for many years to come.

It is gratifying to note that, in America particularly, the value of scientific research on this large problem has always been fully recognised, and that it is now the custom for any scheme of magnitude to be prefaced by preliminary scientific studies. The intelligent co-operation of the engineer and the biological chemist in this work is certain to justify itself by advancing each case nearer to the goal of perfection.

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: EIGHTH LIST.

During the months of July, August and September, 1912, the Road Board, with the approval of the Treasury, have made advances amounting to £172,703 from the Road Improvement Fund to county councils and other highway authorities as follows:—

	£
For road crust improvements	136,724
For road widenings and improvement of curves and corners	5,422
For road diversions	407
For reconstruction and improvement of bridges	19,000
For construction of new roads and bridges	11,150

The total grants, after deducting grants cancelled, up to September 30, 1912, are as follows:—

	£
For road crust improvements	662,150
For road widenings and improvement of curves and corners	75,218
For road diversions	21,206
For reconstruction and improvement of bridges	36,475
For construction of new roads and bridges	16,078

Advances by way of loan have also been made to the sum of £108,857.

In addition, further advances amounting in the aggregate to about £702,000 have been indicated to highway authorities towards works of road improvement of which the details are still under consideration and discussion.

The Discharge of Effluents into Tidal Streams.

ROYAL SANITARY INSTITUTE DISCUSSION AT LEWES.

An interesting description of the new sewage scheme for Lewes, with special reference to the discharge of effluents into tidal streams, was submitted at a sessional meeting of the Royal Sanitary Institute held in the council chamber of that town on Friday evening last, the author of the contribution being Mr. D. Roberts, the borough surveyor. Mr. H. Percy Boulnois, M.Inst.C.E., chairman of the council of the institute, presided over a large gathering of members and others, those present including representatives of Margate, Gravesend, Worthing, Eastbourne, Bexhill, London, Southampton, Chichester, and West Kent.

In welcoming the members to Lewes, the Mayor (Dr. Hugh Stott) said the corporation were both proud and honoured by the visit of the Royal Sanitary Institute. It was gratifying to think that men like those belonging to the institute should come among them to stimulate, if possible, the excellent sanitary work that was being carried on in their midst. He trusted that they would be able in some measure to instruct them, as they would be able to show them that in Lewes they were not behind the times or not alive to the necessities of modern sanitation and to the importance of stamping out that terrible scourge consumption.

Mr. H. Percy Boulnois, the chairman of the council of the institute, in taking the chair, said he could only say on behalf of the Royal Sanitary Institute that they were extremely glad to have an opportunity of holding a sessional meeting in that ancient town. These sessional meetings, which they held in various provincial centres, were extremely useful, not only in bringing together people interested in sanitary matters, but in helping to increase the membership of their great body. He said "great body" because it was almost unique in its character, representing as it did no particular profession, but including in its ranks medical men, engineers, architects, and members of the general public, so that the questions of sanitation they dealt with were approached on very broad lines.

BOROUGH SURVEYOR'S PAPER.

Lewes, as is well known, is the county town of Sussex, and is situated about eight miles from the sea coast. Mr. Roberts explained that the greater part of the borough is situated upon a ridge and sloping sides of chalk running in an easterly direction from St. Anne's and the neighbouring South Downs into the valley of the tidal river Ouse. On the opposite side of the river is the low-lying portion of the borough approached by the Lewes Bridge, and known as the Cliffe District. It lies on an alluvial flat, which is bounded on the east by the Cliffe Hill. On the south of the town, and parallel with the borough, is the Southover District, a locality known as the Wallands on the north side occupying an elevated site. The borough has an area of 1,024 acres, with a population of about 11,500, and a road mileage of about 15½ miles.

Only a portion of the borough was drained before the incorporation in 1881, but since that time the whole of the borough has been sewered, though in sections. In 1891 the late Mr. Arthur Holt, borough surveyor, prepared a scheme of drainage for the whole of the borough, and in that work he was assisted by Messrs. Brierley and Holt, of Blackburn, the engineers for the scheme now in course of construction. That scheme was never carried out as a whole, but from time to time sections of it have been completed, practically on the lines as laid down at that time. In 1895 St. Anne's district was sewered by the late Mr. Holt, and in 1896 the Paddock Valley and in 1905 Southover district were sewered by the late Mr. T. W. Franks, the then borough surveyor. In 1903 the Cliffe was sewered by Mr. Roberts. The work in this district was by pipes to the ordinary ground, chiefly alluvial deposit and waterlogged. Under this system the sewage is discharged into the river by means of two 100-gallon capacity Shone's ejectors, the compressed air for these ejectors being driven by automatic electrical machinery erected to pump a daily dry-weather flow of 400,000 gallons. The sewering of the Wallands district was carried out partly under Section 1 of the Public Health Act, 1875, and partly by the owners when laying out the estate. There are three roads on the Wallands estate drained under the separate system; the Cliffe district is also on the separate system, the old culverts being utilised for surface-water drainage. No other part of the borough is similarly drained. The whole of the sewers in the borough now discharge into the river Ouse at five different points, the highest one being at the Corporation yard, and the lowest at the point of discharge from the Cliffe ejectors, a distance of about 900 yards. It is proposed in the new scheme to pick up the sewage discharging at those points and convey the whole to the proposed sewage works at Southerham, on the south side of the borough, the effluent to be discharged at one point only into the river Ouse, adjoining the site of the works.

LEWES' NEW SEWERAGE SCHEME.

The new scheme provides for the interception of the existing main contributory sewers, the construction of high and low level intercepting and outfall sewer, sewage disposal and outfall works at Southerham, and the erection of pumping plant at Pinwell to deal with the low-level system, and the construction of several new tributary sewers in the borough. The high-level intercepting sewers will be of cast-iron, 18 in. in diameter at the lowest end, and 15 in. in diameter in the upper portion. A low-level intercepting sewer of 9-in. cast-iron pipes will be laid from Pinwell alongside the high-level sewer. This will intercept the sewage from the Paddock Valley district, which now discharges into the river at the Corporation Wharf. Another low-level intercepting sewer will branch away in the opposite direction to the last-mentioned sewer from Pinwell to the end of the Winterbourne Valley sewer. This will intercept the sewage now discharging into the Winterbourne stream.

A small pumping station will be erected on land acquired for the purpose on Pinwell-road, adjoining the railway station, the sewage from the low-level sewer being lifted through a 15-in. cast-iron pipe into the high-level sewer adjoining by means of three sets of centrifugal pumps driven by electric motors. The motors will be automatically controlled by floats so arranged as to be switched on and off according to the flow. These sets of pumps will be capable of raising 5,000, 35,000 and 40,000 gallons per hour respectively; one of the larger sets will be a stand-by. A screen will be constructed in the pump-well to arrest flocculent matter.

The construction of the main outfall sewer of 18-in. cast-iron pipes is nearing completion. This crosses the main and branch lines of railway near the Lewes Station, and in part is in the nature of a syphon, access for inspection being provided at each manhole.

The sewage disposal works will comprise six storage tanks, 60 ft. by 30 ft. by 7 ft. deep, with a total capacity for 472,500 gallons, with dividing wells at inlet for dividing "ordinary flow" and "storm water;" screening tanks in duplicate, a "top," "bottom," and sump sludge pit with small pumping plant in duplicate, worked with oil-engine and centrifugal pumps; and four sludge drying beds. The main effluent outfall drain will be 21-in. iron pipes fitted with tidal flaps.

Quantity to be stored in tanks (... hours)		...	472,500
Quantity to be stored per hole ...	...		450,000

EFFLUENT DISCHARGE INTO THE TIDAL RIVER OUSE.

The sewage will gravitate from a drawing well to a screening chamber in which will be an inclined screen of parallel iron bars to arrest solid matter and floating refuse, heavier matter, such as road grit and

detritus, will be arrested and deposited at the bottom. The sewage will then pass to a dividing well, where the flow will be divided into "ordinary flow" and "storm water," and dealt with in the storage tanks accordingly. The flow to be provided for is up to three times the dry-weather flow, or 1,080,000 gallons per twenty-four hours treated as sewage proper, and the remaining volume of 1,080,000 gallons per twenty-four hours treated as storm water.

Two sets of storage tanks are provided of the dimensions already given. The first series are of sufficient capacity to allow for the sewage being stored for about five hours. The tanks are so designed that the inclination at the bottom is away from the river and towards the sludge pits, which will allow all sedimentation to flow back in the form of sludge and to be treated in beds of special design. In addition to these tanks another group will be provided to be filled by an overflow passing over a weir the whole length of the end of the tanks—*viz.*, 30 ft. In these secondary reservoirs (which, Mr. Roberts suggests, might be known as tidal storage receptacles) the effluent will be retained until one hour after high tide, when, by a system of penstocks (possibly automatically controlled), the contents will be discharged on the ebbing tide. The outfall into the river Ouse, as mentioned, is of 21-in. iron pipes, and carried about 2 ft. below low-water level. This outfall pipe will be laid at an acute angle with the river and discharge down stream with ebbing tide, and at one of the widest points of the river. The borough surveyor adds:—"It is obvious that what with the screening, the sedimentation in the first tanks, and the considerable amount of precipitation that will take place in the tidal storage reservoirs, the condition of the effluent as it passes into the river should leave little to be desired."

The tide in the river Ouse flows for a period of three hours and is nine hours on the ebb. The effluent discharge will commence one hour after high water and cease one hour before low water. The point of discharge into the river is about 7¼ miles from the sea and about one mile below Lewes Bridge. The tide-levels near the point of discharge are—*viz.*:—High water, ordinary spring tides, 10·52; high water, ordinary neap tides, 6·12; low water, neap tides, 0·42; low water, spring tides, 0·37 above O.D.

In September and October, 1904, Mr. Roberts gauged the flow of the river Ouse, near the discharge from the Cliffe ejectors (about half a mile above proposed effluent discharge), with the following results: A spring tide flowing during a period of 2 hrs. 55 min., with high-water mark at 10 ft. O.D., approximated 45,000,000 gallons, showing a pollution of one gallon of sewage to about 250 gallons of tidal water. A neap tide flowing 2 hrs. 58 min., with high water at 6 ft. O.D., approximated 20,000,000 gallons, or a pollution of about one gallon of sewage to about 110 gallons of tidal water. The fresh water coming down the stream was also gauged at Hamsey Lock (about 1½ miles above Lewes), which approximated 17,000,000 per day, so that on the ebbing tide there is a further dilution. Mr. Roberts mentions that the tidal portion of the river Ouse extends about thirteen miles from the sea, and that it is navigable throughout for commercial purposes, chiefly up to Lewes, and the up river stretch for pleasure (boating and fishing).

In concluding his paper, Mr. Roberts said: "It is a difficult matter to draw comparisons between one tidal stream and another into which sewage is discharged, as the circumstances are ever varying, and every case must always be judged by results. When the final Report of the Royal Commission on Sewage Disposal has been issued there may be some data arrived at, or standard fixed, to govern the extent to which sedimented sewage may be discharged into tidal streams or rivers. For years past the crude sewage of Lewes has been discharged into the tidal Ouse at all states of the tide and in the centre of the town, and the nuisance resulting has been only apparent, due to the solids and flocculent matter floating about and the discolouration near the points of discharge. The large volume of tidal and river water has always rendered the sewage innocuous. It is therefore obvious that with a better effluent discharged into the river at one point only, that one at least a mile nearer the sea, and on the ebb tide, there must be a considerable improvement as compared with the conditions now existing."

DISCUSSION OF MR. ROBERTS' PAPER.

The Mayor (Councillor Hugh Stott, J.P.), in opening the discussion on the paper, said it appeared to him to be deserving of careful consideration whether it was desirable to place upon the ratepayers of a town situated on a tidal river near the sea the enormous burden of treating their sewage before its discharge. There were naturally sentimental objections to the disposal of untreated effluent in such a manner, but the treatment of sewage by sea-water was a most effectual method, as had been acknowledged from time immemorial.

Mr. A. J. Martin (Westminster) said that, so far as one could judge, the scheme described by Mr. Roberts had been designed with every regard to the special requirements of the area to be dealt with. The perfection of a scheme of that character depended, of course, very much on details, and in the absence of the latter one was unable to criticise the scheme, or say how far it met the needs of the district; generally speaking, however, it seemed most suitable. He noticed that a very considerable length of sewer was in cast-iron, and that there was no mention of any other material. He supposed that was explained by the very treacherous nature of the ground. An interesting feature of the scheme was the use of high-level intercepting sewers to bring as much as possible to the outfall and avoid excessive pumping; but he took it that the distinctive feature of the work was the method of disposal. At present they were turning an unfiltered effluent into the river, and the question which had to be decided was whether an expenditure of some thousands of pounds on a system of purification was called for. One could not, of course, pronounce an opinion on a matter of that kind without a preliminary personal inspection of the river, but on the face of it he was inclined to think they were right in what they did. The method they had adopted—namely, that of discharging the sewage into a large volume of fully oxygenated water—was an effective and scientific method of disposal. With regard to the dilution figures, these seemed to be based on the assumption that the whole of the sewage left the estuary at every tide, and it involved the further assumption that the 7¼ miles of estuary were traversed in five hours, or at an average rate of 2¼ ft. per second. Unless that velocity were actually attained one would not get the sewage clear of the river, and if that were not done the dilution would not be as great as was shown by these figures.

Alderman Every (Lewes) expressed pleasure at the remarks of the last speaker. Replying to the inquiry with regard to the cast-iron pipes, he stated that the reason for their use was, as had been suggested, the nature of the ground through which they were to pass. In the course of other observations Alderman Every pointed out that a scheme prepared in 1866 was practically based upon the same route as the present scheme. Instead of carrying out a comprehensive scheme, the authorities in days gone by sewered various parts of the town, hoping that the little schemes would weld themselves into one harmonious whole.

Mr. J. W. Blizard (Southampton) said he was sorry that he had to differ with Mr. Martin. Mr. Martin had expressed the view that the course which had been adopted of discharging the effluent into the river was the right one. He (the speaker) thought it was absolutely wrong. He had been responsible for the provision of several sea outfalls, and was sorry for it, and if he had his time over again he would certainly advocate filtration, because of the fisheries. In the present case the point of discharge was seven miles from the sea, and the question was how far the effluent would flow down the river and whether it would actually leave the mouth. His belief was that it would not. He was not a prophet, but he predicted that Lewes would have to purify their sewage later on. That the Local Government Board should have sanctioned such a scheme was a surprise to him, and he considered it would be in the interests of the town if they carried out the work now instead of being compelled to do it in the future.

Mr. H. A. Roechling (Westminster) said that, judging by what he had seen so far, and having regard to the provision made for further treatment, for the present every need had been met. If, as Mr. Blizard predicted, that further treatment did eventually become necessary, it would be a simple matter to arrange for it, but to embark on such an expenditure now would be most unwise.

Dr. James McGlashan, chairman of the Newhaven Urban District Council, in urging the desirability of means of purification being adopted, alleged that the Lewes sewage did not reach the sea in a single tide, and that it was frequently only after three or four tides that the river was cleared.

The Chairman (Mr. H. Percy Boulnois), in closing the discussion, said he preferred, in the absence of exact knowledge of the local conditions, to make no remarks on the paper. But the scheme, it appeared, had received the sanction of the Local Government Board, and they could take it from him that that approval would not have been given unless the Board had been advised that it was a safe scheme to carry out.

Mr. Roberts, in his reply, stated that he took some float tests a year or two ago on a spring tide, and a float put in the river opposite the point at which the sewage was discharged went right out to sea in just over five hours. On a mean ebb tide the float went just to the end of the quay at Newhaven. It might be a fact that sewage went into the river at the lowest state of the tide, but bacteriological examination of the water long before Newhaven was reached had shown no trace of sewage in the river.

Votes of thanks to the Mayor for the use of the council chamber for the purposes of the meeting, and to Mr. Roberts for his paper, then brought the proceedings to a close.

On Saturday visits were paid by those attending the meeting to the Phœnix Ironworks and the Lewes Portland Cement and Lime Works, the Victoria Hospital, the borough isolation hospital, the fire brigade station and the waterworks. The party were received at the Phœnix Ironworks by the proprietor, Alderman Every, and his son, Mr. J. M. Every, by whom they were conducted through the various departments. At the cement works they were met by Mr. A. Batchelor and Councillor E. A. Glover, representing the company, to whom, as at the ironworks, the chairman of the council of the institute, Mr. Percy Boulnois, expressed thanks for the courtesies extended to the members. The Mayor (Dr. Hugh Stott) afterwards entertained the visitors at luncheon at the Bear Hotel.

THE DESTRUCTION OF CONCRETE BY ELECTROLYTIC ACTION.

Mr. Cyril de Wyrall, in a paper entitled "Electrolytic Action on Unreinforced Concrete," published in the "Proceedings" of the International Association for Testing Materials, takes the view that concrete may, under certain conditions, be damaged by electrolosis. Much has been written and said about the effect of electrolytic action on steel and iron and upon reinforced concrete, but hitherto there does not appear to have been any evidence that plain concrete is liable to disintegration by this action. The author, in examining some bolts embedded in concrete, found that not only had the bolts been affected by an electric current, but that the concrete surrounding the bolts had become disintegrated to such a degree as to make it almost useless. The effect was greatly intensified where the concrete was wet. Again, in an examination of a concrete wall six years after construction a similar result was apparent. This wall carried no load, and was below tide level; it was 3ft. thick and was made of a 1:2:4 mixture of cement, sand and trap rock. The work had been well done. "The examination showed a disintegration to such an extent that the surface was practically mush." A year later another examination was made, and large sections of from 4in. to 6in. thick, which crumbled in the hands, could be pulled off the face. Last year still further disintegration was found to be in progress. A voltometer test showed that a current under 11 volts pressure was passing through the structure. Other instances are quoted of a similar nature. It should be noted that this disintegration appears to take place anywhere the concrete is wet. Where concrete was dry no voltage was found.

Judging by this examination, it seems that further investigation and proof is required before it need be assumed that concrete is liable to disintegration by electrolytic action under normal conditions.

Woolwich Subway. The new footway under the Thames at Woolwich will be opened on the 26th inst.

SIR GEORGE GIBB AND ROAD MAINTENANCE GRANTS.

THE DUTY OF LOCAL AUTHORITIES.

A representative of the *Daily Mail* sought an interview this week with Sir George Gibb, the chairman of the Road Board, to discuss the various criticisms on the Road Board's action in not making special allowances for road repairs to local authorities in London who suffer severely from excessive motor-omnibus traffic. Sir George discussed the matter frankly, and said he wanted the Press to study the board's last annual report, in which the policy of the board was fully stated.

"Under the Act of Parliament constituting the Road Board," said Sir George Gibb, "the board is prohibited from making grants for maintenance. It is authorised to make advances 'in respect of the construction of new roads or the improvement of existing roads,' and 'to contribute towards the cost of the maintenance of such new roads,' but not of the old ones.

"There is a legal liability upon highway authorities to maintain roads for all traffic. It is true that many roads are now unsuitable for motor traffic. They are not strong enough for modern requirements. Many of them have been allowed to get into a very weak condition. While it is impossible not to feel some measure of sympathy for the small local authorities who are called upon to pay extra for road maintenance owing to motor traffic, their duty to maintain the roads is clear, and relief towards maintenance expenditure can only be given by an alteration of the law by Parliament. But highway authorities can protect themselves by raising their standard of construction when re-coating the roads. This would lead to cheaper maintenance than continuing old methods of renewal of surfaces. In fact, the methods of maintenance need to be modernised. The board advances money at low rates of interest, and in some cases without interest, for improvements which are likely to increase the life of surface coatings in a greater ratio than the increase of cost."

THE PETROL TAX.

In answer to the charge of "hoarding money" which has been made against the board, Sir George Gibb said: "While it is quite true that the income of the board has been £2,184,314, and the amount actually paid is only £279,081, grants and loans made and indicated—that is, in course of being made—during the same period amounted to £1,177,438, while the board is keeping in hand £875,000 to assist the construction of a new western approach road to London.

Sir George Gibb admitted that a large proportion of the petrol tax was paid in and around London, and that London ought to have a share in it. "The board has recognised this by the large grant promised for the suggested new approach road in London. Modified plans of the western approach road are under discussion with the London County Council and the Middlesex County Council, and I am hopeful that the scheme will go forward."

"Finally," said Sir George Gibb, "it must be remembered that road construction is in a state of transition, and that engineers are not agreed as to the best material for future requirements. It would, therefore, be unwise for the Road Board to spend money too rapidly on experimental methods of surface construction and have nothing left for emergencies, which are bound to arise in the very near future."

Roadmen's Wages.—Llandaff and Dinas Powis Rural District Council, at their last meeting, received from the secretary of the Municipal Employees' Association a letter asking them to pay their roadmen a minimum wage of 27s. a week. The surveyor, Mr. James Holden, said that no application had been received from the men. Forty-five per cent of their men were from 60 to 100 years of age—(laughter)—and their average age was 70, while 55 to 60 per cent were over 50 years of age. The gentleman who made the application did not understand the position of the council. They had kept all the old men on the road, and finding them such work as they were able to do. If the council gave more wages they would probably want more work done, and younger men would oust the older men from their work. It was decided that the communication lie on the table.

CHEAP HEAT AND POWER.

THE "BONECOURT" SURFACE COMBUSTION SYSTEM.

Something like a revolution in the production and utilisation of heat is promised by an invention the principles and chief uses of which are being demonstrated at the Engineering and Machinery Exhibition which opened last Friday at Olympia.

In the early part of last year Prof. William A. Bone, D.Sc., PH.D., F.R.S., Livesey Professor of Applied Chemistry at the University of Leeds, delivered at the Royal Institution two lectures on "Surface Combustion and its Industrial Applications." So deep an interest was aroused, not only in this country but in America and on the Continent, by these lectures, that within a few months the development of the system on a commercial basis was being rapidly proceeded with. Such is the importance attached to the invention of Prof. Bone that the confident assertion is made that probably more trades will become directly interested in and influenced by it than by that of any of the great discoveries of recent years having for their objects economical sources of heat and power. Allied with Prof. Bone in the practical application of his ideas was Mr. C. D. McCourt, A.C.G.I., hence the name "Bonecourt" by which the various forms of the apparatus since devised are known.

The "Bonecourt" patent boiler is claimed to have the remarkable efficiency of 95 per cent. By its use steam can be raised in twenty minutes from cold water, and the normal evaporation is 20 lb. per hour per square foot of heating surface—capable of increase to 30 lb., with little loss of efficiency. The unusually small space occupied by boilers of this type will be realised when it is stated that one is at work at the Skinningrove Ironworks, which, although it is capable of evaporating 5,500 lb. of water per hour into steam at 120-lb. pressure, measures only 10 ft. in diameter and 4 ft. in length. Compared, too, with similar other apparatus, it has been found that the "Bonecourt" muffle furnace effects a very considerable saving in the amount of gas used.

By way of explanation of the system it may be stated that, as distinguished from the ordinary process of flame combustion—in which the molecules travel, step by step, so to speak, through a succession of envelopes, in which various degrees of aëration prevail—a homogeneous explosive mixture of gas and air, in the proper proportions for complete combustion, is caused to burn without flame in contact with a granular incandescent solid, as a result of which a large proportion of the potential energy of the gas is immediately converted into radiant heat. Combustion, it is claimed, is greatly accelerated by the incandescent surface, and, if so desired, may be concentrated just where the heat is required; the attainment of very high temperatures is possible without the aid of elaborate regenerative devices; and, owing to the large amount of radiant energy developed, transmission of heat from the seat of combustion to the object to be heated is very rapid.

There are two principal forms of the surface combustion element, one known as the "Diaphragm" (or No. 1 process) and the other as the "Cavity-Cobble" or "Granular Bed" (No. 2 process). The former consists of a slab of porous fireclay, of any required size or shape, mounted in a frame attached to a box or fuel chamber, from which the combustible or explosive mixture of gas and air, under a suitable pressure, percolates through the porous diaphragm until it reaches the outer face, where it can be ignited. If less air than is theoretically required be present in the mixture, flames will appear on the surface of the diaphragm, and it will become heated, but on reducing the richness of the mixture, though still maintaining the pressure, these flames will disappear, and in a very short time the mixture will commence to burn inside the porous slab at about ⅛ in. from the surface, producing an incandescent or glowing surface devoid of flame and giving out great radiant heat. The temperature near the surface is about 850 deg. Cent. = 1,562 deg. Fahr. Any kind of gas can be used, from rich coal gas to producer gas, the coarseness or fineness of the porous diaphragm being graded to suit the quality and pressure of the gas employed so as to secure the desired results. The principal uses of the diaphragm form include the evaporation of liquids by radiant heat thrown on to the surface of the liquid, and industrial and domestic heating.

The second form of the apparatus presents even a wider field of application arising partly from the fact that higher temperatures can be obtained (over 2,000 deg. Cent. = 3,632 deg. Fahr.), and that the arrangement permits of the application of the process to all shapes and sizes of furnaces. The principles involved are the same in both, but the physical arrangement of the active elements is substantially different. In the No. 2 process the diaphragm is replaced by a bed of granular refractory material, on the surface of each granule of which flameless incandescent surface combustion occurs. These granules can be easily packed into tubes which can be bodily immersed in water for steam raising purposes, or, by other equally simple arangements, employed for the melting of metals, oil and tar distillation, and even cement manufacture.

It will be evident from the foregoing that the system is likely to render possible the development, in the near future, of many important undertakings, the practicability of which has hitherto been a factor of doubt owing to the lack of a satisfactory or economical source of heat; for more detailed information with regard to it we cannot do better than suggest a call at the offices of Bonecourt Surface Combustion, Limited, Parliament-mansions, Westminster, or a visit to their stand (No. 329a) at the exhibition we have referred to, where the apparatus can be seen in actual operation during the next fortnight.

Glasgow's New Aqueduct.—A notable stage has just been reached in connection with the extension of the waterworks of Glasgow. The tunnel which is being made in Rob Roy's country at Inversnaid to connect Loch Arklet with Loch Katrine has just been bored through. The length of the tunnel is 1,300 yds., and the inside dimensions are 12 ft. by 10 ft. The boring operations were commenced over two years ago, but owing to the hardness of the rock the progress has been slow. At each end of the tunnel large basins are to be built.

Water Supply at Looe.—A new water supply for the urban district of Looe (Cornwall) was formally inaugurated last week. The water rights have been obtained from the Duchy of Cornwall. This scheme, carried out at a cost of £600 by Mr. J. Alderman, has involved the establishment of a pumping station. An oil engine, supplied by Messrs. Campbell & Sons, of Halifax, capable of pumping 2,500 gallons of water against a head of 3 ft., will augment by 20,000 gallons per day the supply in the existing reservoir at Wayland which stores 200,000 gallons.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

276. Roof Design.—It is found necessary in designing the steel trusses for a roof to adopt some system of wind bracing. Explain in detail how the cross-sectional area of the wind ties is determined. (H. F. W., *Tottenham.*)

277. Sewage Disposal.—What main principles should be kept in mind in arranging the sewage disposal of the following: (*a*) A village of 800 inhabitants (purely agricultural)? (*b*) A town of 2,000 inhabitants (industrial)? (*c*) An infectious diseases hospital of 100 beds? ("Charger.")

288. Mechanics.—Give an expression for the tension of the bucket rod or piston rod in a common suction pump. The barrel of the pump is 8 in. diameter, and the stroke of the bucket or piston is 10 in. Find the work done per stroke in ft.-lbs. when the spout is 16 ft. above the surface of the water in the well. (A.M.I.C.E., October, 1901.)

289. Paving.—What is the best material for paving carriageways of steep gradient? Give reasons. ("Mumeng.")

290. Building Construction.—The walls at the base of a high brick tower are 3 ft. 9 in. thick. Describe, with drawing, what footings should be provided, the thickness of concrete, and the distance below the surface. (T. R.)

291. Surveying.—Upon what trigonometrical rule does triangulation depend? Prove that the sides of a triangle are proportional to the sines of the angles opposite to them.

REPLIES TO QUESTIONS.

275. Cantilever.—A cantilever of uniform cross-section and length L carries a concentrated load W at the free end. A prop is placed at a point $\frac{L}{4}$ from the free end, bringing this point to the same level as the fixed end. Find an expression for the reaction at the prop, and the deflection of the free end of the cantilever. Neglect the weight of the cantilever. (B.Sc.Eng. Final.) (H. F. W., *Tottenham.*)

This problem can be solved in the following manner: Assuming

$$\frac{d^2y}{dx^2} = \frac{1}{EI} M \quad . \quad . \quad . \quad (1)$$

where E = Young's modulus for material of beam.
I = moment of inertia of beam.
M = bending moment at any part in beam.

This formula is proved in any standard text-book on strength of materials.

Let A be the point in cantilever at which it is supported by prop. Let the force in prop = P

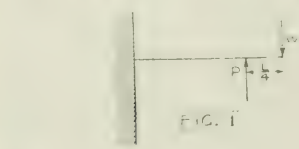

FIG. 1

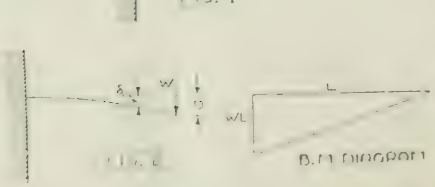

Consider as in Fig. 2 the bending moment at a point x from end and under action of W *only*.

It is required as first step to find deflection of A due to W.

$$M_1 = Wx$$

$$\therefore \frac{d^2y}{dx^2} = \frac{1}{EI} Wx$$

The slope of curve is given by integrating, thus

$$\frac{dy}{dx} = \frac{1}{EI}\left(\frac{Wx^2}{2} + C_1\right)$$

to evaluate C_1 $\frac{dy}{dx} = 0$ when $x = L$

$$i.e., \quad 0 = \frac{1}{EI}\left(\frac{WL^2}{2} + C_1\right)$$

$$C_1 = -\frac{WL^2}{2EI}$$

$$\therefore \frac{dy}{dx} = \frac{1}{EI}\left(\frac{Wx^2}{2} - \frac{WL^2}{2}\right)$$

Integrating to get deflection

$$y = \frac{1}{EI}\left(\frac{Wx^3}{6} - \frac{WL^2}{2}x\right) + C_2$$

when $x = L$, $y = 0$

$$\therefore C_2 = \frac{1}{EI}\left(\frac{WL^3}{2} - \frac{WL^3}{6}\right) = \frac{1}{3}\frac{WL^3}{EI}$$

$$\therefore y = \frac{1}{EI}\left(\frac{Wx^3}{6} - \frac{WL^2x}{2} + \frac{WL^3}{3EI}\right)$$

Thus deflection of A due to W is given by putting

$$x = \frac{L}{4}$$

in this formula.

$$y = \frac{1}{EI}\left(\frac{W}{6}\frac{L^3}{64} - \frac{WL^2}{2}\frac{L}{4} + \frac{WL^3}{3}\right)$$

$$= \frac{WL^3}{EI}\left(\frac{1 - 48 + 128}{64 \times 6}\right)$$

$$= \frac{27}{128}\frac{WL^3}{EI} \quad . \quad . \quad . \quad . \quad . \quad (2)$$

Now consider as in Fig. 3 the upward movement of A due to P acting alone.

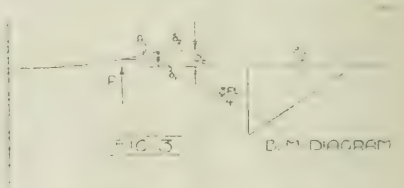

FIG. 3

The movement is given by the ordinary formula for deflection of a cantilever loaded at end—*viz.*:—

$$\delta = \frac{Wl^3}{3EI}$$

where $l = \frac{3}{4}L$, and $W = P$

$$\therefore \text{this movement is} = \frac{P}{3EI}\frac{27}{64}\frac{L^3}{}$$

$$= \frac{9}{64}\frac{PL^3}{EI} \quad (3)$$

But since the point A remains on the same level, the downward movement of A given by (2) and the upward movement given by (3) must be equal

$$i.e., \quad \frac{27}{128}\frac{WL^3}{EI} = \frac{9}{64}\frac{PL^3}{EI}$$

$$\frac{3}{2}W = P$$

$$i.e., \quad P = \frac{3}{2}W$$

The value P in terms of known load W

Final Deflection of End. This is compounded of two movements of the end—first, a downward one due to W, and, secondly, an upward one due to **P**.

It is easily deduced from (1) that the deflection

of the end of a cantilever is proportional to moment of area of B.M. diagram about free end; also, that the slope of the curve (of the beam) at this point is proportional to area of B.M. diagram.

Applying this, downward deflection

$$= \frac{1}{EI} \times \text{moment of area of B.M. diag. for Fig. 2 about end}$$

$$= \frac{1}{EI} \times \frac{WL^2}{2} \frac{2}{3} L$$

$$= \frac{WL^3}{3\,EI} = D_1 \text{ (in Fig. 2)}$$

Upward deflection must be found by two steps: -

(1) Find upward deflection of A.

(2) From this to get upward deflection of end.

(1) This is given by

$$\frac{9}{64} \frac{PL^3}{EI} = \frac{27}{128} \frac{WL^3}{EI} - \delta_1 \text{ (Fig. 3)}$$

$$\text{Slope of curve at A} = \frac{1}{EI} \times \text{area of B.M. diag. (in Fig. 3)}$$

$$= \frac{1}{EI} \frac{9}{32} PL^2$$

$$\text{i.e., } \tan\theta \text{ (Fig. 3)} = \frac{1}{EI} \frac{9}{32} PL^2$$

$$= \frac{1}{EI} \frac{9}{32} \frac{3}{2} WL^2$$

$$= \frac{27}{64} \frac{WL^2}{EI}$$

$$\text{also } \tan\theta = \frac{\delta_2}{\frac{L}{4}} \text{ (see Fig. 3)}$$

$$\text{i.e., } \delta_2 = \frac{L}{4} \cdot \frac{27}{64} \frac{WL^2}{EI}$$

$$\frac{27}{256} \frac{WL^3}{EI}$$

(2) Thus total upward deflection of end

$$= \delta_1 + \delta_2$$

$$= \frac{WL^3}{EI} \left(\frac{27}{128} + \frac{27}{256} \right) = \frac{81}{256} \frac{WL^3}{EI} = D_2$$

$\therefore$ Total deflection of end of cantilever $= D_1 - D_2$

$$= \frac{WL^3}{EI} \left(\frac{1}{3} - \frac{81}{256} \right) = \frac{13}{768} \frac{WL^3}{EI}$$

(R. E. S., *Bristol.*)

INTERCEPTING TRAPS IN HOUSE DRAINS.

IMPORTANT MEETING ARRANGED.

At a meeting of the Royal Sanitary Institute to be held at 90 Buckingham Palace-road, S.W., on Tuesday, November 12th, Mr. H. Percy Boulnois, M.INST.C.E., chairman of council of the institute, will open a discussion on the recently issued report of the Departmental Committee on Intercepting Traps in House Drains.

The chair will be taken at 8 p.m. by Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., chief engineer to the London Council Council.

Institution of Civil Engineers' Awards.—The council of the Institution of Civil Engineers have made the following further awards for papers read during the session 1911-12: A Watt Gold Medal to Prof. W. H. Burr (New York), and the Crampton Prize to Prof. R. J. Durley (Montreal). They have also awarded the following Telford Premiums for papers published in the "Proceedings" without discussion during the same session: To Messrs. Paul Seurot (New York), David Anderson and Harry Cunningham (London), S. P. Smith, D.SC. (Birmingham), E. G. Rivers, I.S.O. (Richmond) and E. H. Morris (Manchester), and Prof. A. H. Gibson, D.SC. (Dundee). The Howard Quinquennial Prize per 1912 has been awarded to Mr J. H. Darby (Sheffield), in recognition of improvement introduced by him in iron and steel production, and the Indian Premium for 1912 to Mr. H. H. G. Mitchell (Madras). The council have made the following awards in respect of students' papers read during the session 1911-12: The "James Forrest" Medal and a Miller Prize to Mr. E. P. Curtail, B.SC. (Birmingham); and Miller Prizes to Messrs. J. H. Taylor (Glasgow), W. P. Watson, B.SC. (Bristol), G. Ingram (London), E. F. Hunt (London), H. J. F. Gourley, B.E. (London), H. G. Hookings (London), E. A. Cross, B.SC. (Birmingham), and J. and W. Legg (London); and the "James Prescott Joule" Medal to Mr. V. E. Green (Birmingham).

CORRESPONDENCE.

"Be calm in arguing; for fierceness makes
Error a fault and truth discourtesie"
—Geo. Herbert, "*The Temple*."

THE INTERCEPTING TRAP AND THE VENTILATION OF SEWERS AND DRAINS.

To the Editor of The Surveyor.

Sir,—The report of the Departmental Committee of the Local Government Board on "Intercepting Traps," and the paper in your issue of the 17th ult. by Mr. de Courcy Meade, of Manchester, giving an account of his experiments on the Manchester sewers, are both extremely interesting to me, seeing that the former proves up to the hilt every count in the indictment against the intercepting trap which I first began to formulate in 1881, and the latter explodes the exaggerated claims of the numerous patent systems which generally claim to remove fabulous quantities of sewer gas from impossible lengths of sewers.

The objections to the trap are very well summarised in your quotation of remarks by Mr. R. L. Fox, of New York, published in your issue of the 4th inst.

The superstition of the intercepting trap dies hard, and its increasing numbers during the last thirty-five years have completely muddled the whole system of sewer ventilation in the great majority of towns, and now we are faced with the difficulty of its abolition. But this is not an expensive matter, and should be very easily accomplished. Mr. van Pulten suggests that the stoppers of the raking arms should be taken out. This is a very good suggestion as a temporary measure, but it does not get over the retention of the solids by the trap, and the resistance to the flow of sewage caused thereby, but it would probably get over the sentimental objection that any new drains without traps would be taking their undue share of the ventilation of the sewers. This objection could be overcome by making sound drains, especially where they pass under a dwelling-house, instead of outside as they should do where possible. The best method of making a sound job with the drains is to joint them with bitumen similar to that used for insulating purposes in electrical work. Stoneware pipes jointed in this manner can be walked over within half an hour after they are laid, and two pipes can be jointed together on the surface, and lowered into the trench, so that only half the number of joints have to be made in the trench itself, and if the drain is sound it matters not to the inhabitant of the house what passes through it.

The question of the intercepting trap and sewer ventilation has never been so thoroughly investigated before the present time, for the simple reason that there were so many points to be considered and experimented upon that no single individual could afford either the time or the expense for such an investigation, and the bugbear of the whole question has always been that each individual was generally arguing from a different and isolated point of view. We are therefore greatly indebted to the Local Government Board for their very exhaustive investigation of the whole subject, and it is not until the local authorities have power to arrange and control the ventilation of sewers and drains as one system in accordance with local conditions that any satisfactory results will be arrived at. Systems of ventilation can only be local, as it has been proved over and over again that any attempt to ventilate beyond a ¼-mile radius is a failure. Therefore the exaggerated fears indulged in by the public and others that the ventilation of a whole town can be brought to one or two isolated spots are entirely unfounded. The Bristol system, or absence of system, of ventilation is always quoted as a reason for not attempting to ventilate sewers at all, but inasmuch as whenever they want to enter a sewer they have to open several manholes for several hours before entering, it looks to me rather like Pandora's box, storing all the evils of the sewers up for a time, and then letting them all out at once.

I think it has been proved that the system of surface ventilation alone is merely stagnation, depending upon the force and direction of the wind to make it work. The system of shafts alone is simply creating similar conditions at a higher level, but with this advantage that it is above the head of the people, and if the shafts are not obstructed or overshadowed, the direction of the wind is not of so much importance, but the force of the wind converts some shafts into outlets and some into inlets with a similar action

to that of the surface ventilators when they were alone; but it has always seemed to me that the true solution is to find out the proportion which the surface ventilators should bear towards the shaft ventilators, and the surface ventilators should be as small both in size and numbers as possible, so as to create an in-current which could not be reversed.—Yours, &c.,

THE CROMPTON PAVEMENT.

To the Editor of The Surveyor.

Sir,—It seems a great pity that Mr. W. J. Howard-Smith should make invidious comparisons when apparently he knows next to nothing about bitumen.

The veriest tyro in the manufacture of bituminous paving mixtures knows why a percentage of cement is employed, and anyone who in recent years has followed American practice would also know that Colonel Crompton is merely paying America the high compliment of emulating their example of constructing country roads on the principle of first laying a foundation of asphaltic concrete, varying in thickness according to the nature of the traffic pertaining to the road in question, upon which an asphaltic sheeting or wearing surface is superimposed, but as to why Colonel Crompton should specify that all the ingredients should be mixed at a temperature of 600 deg. Fahr. is difficult to understand, as no known fluxed bitumen will stand such a high temperature without considerable detrimental alteration to its nature.

Further, where in this country we deal with yards in America they deal with miles on this system, and that at a price of about 60 cents (2s. 6d.) per super. yard, which price usually carries with it free maintenance for at least five years.—Yours, &c.,

The Havana Exploration Company, Ltd.
Cecil Nathan, General Manager.

3 London Wall-buildings,
London, E.C.
October 7, 1912.

[Two misprints, we find, occurred in the letter of Mr. Howard-Smith which appeared in last week's issue. In the second paragraph the word "wish" was printed as "rush," and in the quotation from Colonel Bingham's specification the word "pegs" was misspelt.—Ed. The Surveyor.]

NON-SLIPPERY WHINSTONE.

To the Editor of The Surveyor.

Sir,—From the paragraph in your issue of the 27th ult. (p. 438) I gather that the Corporation of Portsmouth are flattering themselves that their tramway extensions have been paved with "whinstone which is not slippery."

It is to be hoped that disappointment in this respect will not be experienced. If such should happily be the case the members of the Tramway Committee, who together with the manager selected this material, are to be congratulated in having discovered a *rara avis* in whinstones; it must certainly be quite different to any I wot of. I claim a fairly wide experience of this class of rock as a paving material. This experience has not been such as to cause me to look upon whinstone as a possible material to employ in the construction of those tramways for which I have been the engineer.

The avoidance of slipperiness in paving in any class of material—is, of course, a matter of special concern to tramway authorities, in view of their legal liability on this score under the well-known Dublin decision.

One good trait to be remarked and commended is that the Portsmouth whinstone honestly declares its name and has not disguised itself by usurping the name of "Scotch granite," a trick whinstones from over the border are sometimes prone to adopt.—Yours, &c.,

W. J. Howard-Smith.

October 8, 1912.

Railless Trolley System at Rotherham.—The trolley bus system between Rotherham and Maltby was formally inaugurated last week. Rotherham is the first municipality to receive authority to go outside its own area.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Batley T.C. (October 2nd. Mr. P. M. Crosthwaite).—£16,395 for sewage disposal works and £3,616 for widening Mayman-lane and Healey-lane.—The borough surveyor, Mr. O. J. Kirby, stated that it was proposed to provide a new detritus tank, and they were putting down nine first contact beds and six second contact beds, in addition to the eight first contact beds and five second contact beds already existing. The present tank capacity was 1,750,000 gallons, and when the proposed works were carried out the total tank capacity would be 2,263,000 gallons. The population with which the works had to deal was 26,000. The dry-weather flow was 800,000 gallons daily, consisting of 450,000 gallons of domestic sewage and 350,000 gallons of trade waste. The inspector: That is what you treat? The surveyor: That is what should be treated. The inspector: What do you treat at present? The surveyor: As much as we can. It does not amount to more than half that. We have been unable to treat the night flow. With respect to the road widenings, it was explained that a considerable portion of the money it was proposed to spend would go in the purchase of land.

Birmingham T.C. (October 3rd. Mr. T. C. Ekin).—£19,000, £3,340 and £1,034 for works of sewerage and surface-water drainage; £12,894 for the erection of a new boiler-house at the Summer-lane electricity generating station; £2,315 and £4,692 for the provision of additional stabling at the Nechells destructor works and the Lifford destructor works respectively; and £2,700 for the improvement of Hockley brook between Factory-road and the London and North-Western Railway. The town clerk, Mr. E. V. Hiley, alluding to the sewerage schemes, stated that at Hall Green there was an area containing about 400 acres which lay on the western side of the Stratford-road. That district was at present unsewered, and a number of the houses drained into cesspools or streams. The application was to provide surface-water and foul-sewage drains for the district. Referring to an Erdington improvement, Mr. Hiley said the work had become necessary because of the rapid development of building land between Bromford-lane and Gravelly-hill. This was one of the few districts in the city from which it was necessary to pump the sewage to the drainage farm. In most of the other districts the sewage flowed by gravitation. The item of £3,340 was for works projected near those just referred to. With respect to the Summer-lane power station application, the town clerk said the council had commenced the work. They had been obliged to do that because there had been a very large increase in the demand for electric current, especially for power purposes. The total output of the undertaking next year would be about 60,000,000 units. The inspector remarked that if the undertaking progressed at such a rate Manchester would have to look to its laurels. There the output was 87,000,000 units. As regards the improvement of Hockley brook for a distance of 220 yds. between Factory-road and the London and North-Western Railway Mr. Hiley said the work was part of a complete scheme which might be presented as a whole later on. It was rendered necessary because of the difficulty in dealing with storm water in times of flood. It was proposed to deepen and straighten the length in question.

Coventry T.C. (September 13th. Mr. H. R. Hooper).—£1,700 for the purchase of land for the extension of St. Paul's Cemetery. £254 for the widening of Swan-lane, and £338 for the provision of public conveniences at the branch libraries in course of erection at Earlsdon and Stoke.

Derby T.C. (October 2nd. Mr. T. C. Ekin).—£10,750 for the extension of electricity mains and additional plant, and £1,835 for the purchase of property in Osmanton-road and Willow-road for street improvements.—It was stated that the quantity of electricity sold during the past year was 5,923,000 units, as compared with 5,687,000 in the preceding year, and but for the coal strike in March, when the output declined, a considerable profit would have been made on the year's working. The capital expenditure already sanctioned in connection with the undertaking is £323,827, while £328,934 has actually been expended.

Dewsbury T.C. (October 1st. Mr. T. C. Ekin).—£14,500 for the purposes of the electricity undertaking

and £900 for the provision of apparatus for the purification of water at the public baths.—The town clerk, Mr. H. Ellis, stated that the money required for the baths was to obtain a constant supply of clean, warm water in the two swimming ponds. The present method of supplying the baths with water was to take it direct from the town's mains, and warm the water by means of live steam from the boilers. The baths were emptied twice a week in summer and once a week in winter. That meant an expenditure of £4 10s. per week for two months. In summer the cost was about £3 a week. In reply to a question by the inspector, the borough surveyor, Mr. H. Dearden, said the tender for the apparatus amounted to £771, and Mr. Peter A. G. Bell, of the firm of Messrs. Bell Brothers, who are supplying the apparatus, proceeded to give some particulars regarding it. With respect to the proposed loan for the electricty undertaking, it was stated that the money was allocated as follows: £10,000 for new generating plant, comprising a new 1,000 kw. turbine engine, boilers, &c.; £3,500 for distributor cable extensions; and £1,000 for service cables, meters, fire boxes and connections, which, it was estimated, would be required during the next four years. The tender of the Brush Electrical Engineering Company for the 1,000 kw. turbine amounted to £3,728, and the tender of Messrs. W. H. Allan & Sons, Bedford, for the condenser was £1,569, a total of £5,297, as against £5,100 estimated in the application.

Maldens and Coombe U.D.C. (September 25th. Mr. R. H. Bicknell).—£1,627 for the provision of additional pumping machinery at the sewage disposal works.—The clerk, Mr. J. W. Johnson, stated that the works comprised in the scheme for additional pumping machinery had become necessary by the rapid growth of the population, and owing to the fact that in the past the council had permitted a large amount of roof water from the houses to be connected to their soil sewers, so that in times of storm the volume of sewage flow had been increased to an enormous extent. It had been ascertained that a destructor was not the most economical method for obtaining the additional power required for pumping at the disposal works, and the scheme for a destructor had therefore been abandoned. It was desired to instal a 50-horse power Diesel oil engine, to take the place of a 6-horse power gas engine of old pattern. The inspector examined the plans and estimates with the surveyor, Mr. R. H. Jeffes.

Mexborough and Swinton Gas Board (October 3rd. Mr. P. M. Crosthwaite).—£20,200 to develop the gas undertaking recently acquired from the Swinton and Mexborough Gas Lighting Company.—Mr. J. W. Hattersley stated that the works were purchased by arbitration, and the award was £60,370, whereas the original offer was £40,000. In addition, the Gas Board has had to pay all the legal and Parliamentary expenses, bringing the total cost to date to £70,800. The additional £20,000 was required for improving the works, extending the mains and installing new meters and services. He pointed out that in the first half-year of their control they had made £500 more than the late company ever made in a full year. There was no opposition.

APPLICATIONS FOR LOANS.

Aberystwyth T.C. £3,139 for a workmen's dwellings scheme.

Ashford U.D.C.—£15,000 for a drainage scheme.

Bournemouth T.C. £12,650 for the purchase of land for cemetery and pleasure ground purposes and £2,500 for a fire station.

Christchurch T.C.—£3,500 for the purposes of the sewerage scheme.

Colne T.C.—£13,948 for paving and flagging.

Spalding U.D.C.—£20,000 for a sewerage scheme.

Wakefield T.C.—£3,000 for mains, £500 for sub-stations and £500 for transformers for the purposes of the electricity department.

LOANS SANCTIONED.

Coalville U.D.C. £4,600 for gas-works extensions.

Darlington T.C.—£47,550 for the extension of the gas-works.

East Molesey U.D.C.—£1,019 for the improvement of Nightingale-road, Hansler-grove, Matham-road, Feltham-avenue and Hurst-road.—The sanction was given upon the understanding that any sums which might be contributed by the Road Board or the county council towards the cost of the widenig of Hurst-road would be at once applied in repayment of the loan, which should be raised on terms that would permit of this being done.

Ealing T.C.—£7,087 for a secondary school and technical institute.

Hereford T.C.—£1,100 for alterations and repairs to the market hall, and £2,000 for the proposed railway siding to the cattle market.

Holbeach R.D.C.—£2,125 for the purchase of sites for housing schemes.

Luton T.C.—£1,700 for sewerage works.

Maidenhead T.C.—£2,900 for surface-water drainage and footpaths improvement.

Stoke-on-Trent T.C.—£2,028 for the purchase of a site for a school, and £16,000 for new central schools at Burslem.

Wolverhampton T.C.—£1,800 for the purchase of land for open spaces, repayable in sixty years.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works, of which particulars appear below: Buildings—Cheshire £25,000, Edinburgh, Helensburgh £10,000, Ipswich £13,500, Norfolk £30,000, Worcester; housing and town planning—Manchester; parks and open spaces—Littlehampton; refuse disposal—Cleethorpes; roads and materials—Colne £13,948, Hartlepool, Sheringham; sewerage and sewage disposal—Spalding £20,000, Worthing £10,819; water, gas and electricity—Birkenhead £10,500, Exmouth, Stirling £5,200; miscellaneous—Leeds.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Belfast T.C. A [illegible] is to be submitted [illegible] of slipper baths for Dock Ward.

Bolton T.C.—The Electricity Committee recommend the expenditure of £120,000 on a new generating station.

Cardiff T.C.—Consideration is being given to a proposal to erect new buildings for the weights and measures department at an estimated cost of £2,000.

Chelmsford T.C.—The borough engineer, Mr. P. T. Harrison, has received instructions to prepare a general scheme for new council buildings.

Cheshire C.C.—It is proposed to provide, in connection with the operations of Chester, Birkenhead, Stockport and Stoke, a joint sanatorium for 150 [illegible] at a cost of £25,000.

Cleethorpes U.D.C.—A scheme for two shelters and a [illegible] at an estimated cost of £600, has been prepared by the surveyor, Mr. C. H. Waithman.

Coventry T.C.—An electricity sub-station is to be built at a cost of £100.

Diss U.D.C.—The tender of Messrs. R. Hogg & Son, of East Winch, at £285, has been accepted for building a new cottage at the water tower.

East Ham T.C.—The amended estimate of the borough engineer, Mr. J. E. W. Birch, at £1,546, for the construction of an underground convenience at the corner of Barking-road and Central Park-road, has been approved.

Edinburgh T.C.—The new town hall at Portobello, for the erection of which the Dean of Guilds has issued the necessary warrant, has been designed by the city superintendent, Mr. James A. Williamson, A.R.I.B.A., and the cost is estimated at slightly over £6,000. Accommodation will be provided for about 1,000 persons, 500 in the area and about the same number in the gallery, which runs round three sides of the hall. There will also be artists' rooms, kitchen, [illegible] committee rooms.

Flintshire C.C.—A new school is to be erected at Gwespyr at a cost of £2,972, and extensions are to be carried out at the Flint school at an estimated cost of £950.

Hackney B.C.—The tender of Messrs. Allen & Co., at £18,750, has been accepted for extensions of the generating station.

Helensburgh T.C.—A plan has been prepared by the burgh surveyor for the extension of the pier at an estimated cost of £10,000.

Ipswich T.C. The Board of Education have approved a scheme for a new school, at a cost of £13,500.

Newcastle-on-Tyne T.C.—A sum not exceeding £500 is to be spent on expert architectural advice in the matter of the reconstruction of the city hall. It is proposed to enlarge entirely the existing building, and the proposal also includes building a hall to accommodate about 1,000 or 1,200 persons.

Norfolk C.C.—The county surveyor, Mr. T. H. B. Heslop, in a report states that the damage caused to the bridges by the late floods has been confined to the [illegible] bridges. No damage so far as he has been able to ascertain has been done to any of the modern bridges. In the case of the [illegible] bridges have been constructed where they appeared to be necessary. A sum of £30,000 is to be obtained for the repair of flood damages.

Rochester T.C. A material instruction centre is to be provided at a cost of £320.

Truro R.D.C.—A scheme has been discussed for the construction of a pier at Portloe. The council, not being favourable to undertaking the project, have referred it back to the local committee with a recommendation that it be forwarded to the County Fisheries Committee.

Worcester T.C.—The council have approved the principle of the provision of central swimming baths and warm baths, and have requested the Health Committee to submit one or more schemes at an early date.

HOUSING AND TOWN PLANNING.

Manchester T.C.—It has been decided to build thirty more houses on the Blackley estate, and the town planning Committee have been authorised to make application to the Local Government Board for permission to proceed with their scheme and prepare an estimate of the cost.

Mitford and Launditch R.D.C.—A resolution has been passed that cottages should be built where they are found to be necessary.

Southwick U.D.C.—The surveyor, Mr G. W. Warr, has prepared a map of the district showing the area affected by the suggested town planning scheme. It comprises the whole of the land south of the Upper Shoreham-road not already built upon, with the exception of certain isolated plots, surrounded by buildings, which could not be benefited, and upon which it did not appear necessary to place any further restrictions. The area also includes a small portion north of the Upper Shoreham-road. On the map the surveyor also shows the route of a proposed new through road eventually to take the place of the Upper Shoreham-road as a main road into Hove and Brighton.

PARKS AND OPEN SPACES.

Dawlish U.D.C.—The surveyor, Mr. S. F. C. Churchward, has submitted a modified plan for the improvement at Lea Mount, the proposal being to have plain unclimbable railings, and to dispense with the suggested dwarf wall, thus effecting a saving of £200 upon the estimated cost (£600).

Glasgow T.C.—It has been referred to a committee to consider the question of providing a bowling green on a portion of vacant land in Kennedy-street.

Littlehampton U.D.C.—The clerk has been instructed to obtain information from other seaside towns with respect to the provision of a bathing pool, public tennis courts, bowling green and croquet ground.

Sunderland T.C.—The Parks Committee are considering a scheme for providing a municipal golf course. The suggested scheme provides for an eighteen-hole course at Roker, near Seaside-lane.

REFUSE COLLECTION AND DISPOSAL.

Cleethorpes U.D.C.—The question of providing a destructor has been reported upon, and it is to be considered by the Sanitary Committee.

ROADS AND MATERIALS.

Aberdeen T.C.—Schemes for a new road to the links are under consideration.

Carmarthenshire C.C.—Claims of £5 and £3 have been received by the Main Roads Committee from a motor cyclist and motor-car driver in respect of damage sustained from, as alleged, an excess of tar upon a highway. Sir James Hill-Johnes, a member of the council, stated that when he motored over the road in question the tar was "running like a stream." Mr. Mervyn Peel said no doubt the method of tarring the roads in the county could be greatly improved. He suggested that half the road should be tarred at a time. The clerk said that the work was being done by contract and the contractor was liable and not the council.

Chelmsford T.C.—The tender of Messrs. W. Griffiths & Co., Liverpool, at £2,102, has been accepted for paving part of New-street.

Colne T.C. It is proposed to pave Burnley-road and Keighley-road with granite and flag the footpaths, at an estimated cost of £13,948.

Dunfermline T.C.—The main feature of the city extension scheme is to consist of a new road, 130 ft. wide,

connecting the city with the gates of Rosyth Naval Base. In the new road a double line of tramways is to be constructed on a principle that will enable travel to be undertaken at a very cheap rate.

Hartlepool T.C.—The council have generally approved of a scheme for the extension northward of the promenade. No definite plan has yet been decided upon. At the point in question considerable erosion by the sea has taken place.

Lewes T.C.—The Road Board have offered to make a contribution of £200 towards the proposed improvement at the bottom of Station-street, and negotiations are in progress for the purchase of the necessary property.—It has been resolved to purchase two mirrors for dangerous places at 30s. each, the surveyor, Mr. D. Roberts, to place them at some suitable spot as an experiment.

Sheringham U.D.C.—The plans of the surveyor, Mr. F. Hall-Smith, for the improvement of the sea front at an estimated expenditure of £1,450 have been adopted.

Stafford T.C.—Land is to be purchased from Lord Stafford for the construction of the proposed new road from Lichfield-road to Lammascotes.

Teignmouth U.D.C.—The council have accepted the scheme of the surveyor, Mr. J. Knight, for the construction of the new thoroughfare connecting Paradise-road with Haldon-road.

Worthing T.C.—Montague-street is to be paved with wood blocks at a cost of £2,320.

SEWERAGE AND SEWAGE DISPOSAL.

Beverley R.D.C.—The council having invited selected engineers to prepare and submit to them complete schemes of sewerage and sewage disposal for Brantingham and Elloughton-cum-Brough, submitted the schemes so received to Mr. A. M. Fowler, M.INST.C.E., of Manchester; for his award. Mr. Fowler has now presented his report, in which he recommends that the scheme of Messrs. Fairbank & Son, M.INST.C.E., of York, should be accepted, and the council have approved of his recommendation.

East Grinstead R.D.C.—The tender of Mr. J. M. Vine, of Eastbourne, at £3,332, has been accepted for carrying out the work of the St. John's sewerage and sewage disposal works at Crowborough. The estimate of the surveyor, Mr. C. Turton, was £3,732.

Greenwich B.C.—The estimate of the surveyor, Mr. Ernest J. Heward, at £900, has been accepted for the construction of a relief sewer from Delafield-road, Charlton, to Woolwich-road, East Greenwich, the work to be carried out by direct labour.

Loughborough T.C.—With respect to the council's application for a loan of £900 for sewage disposal works, the Local Government Board have written stating that the existing pumping plant was insufficient. The pumping capacity should be increased, and an additional spare pump provided, and it would also be advisable to instal a self-recording gauge to show the level of the sewage in the pump well. The borough surveyor, Mr. A. H. Walker, has been authorised to obtain a recording gauge for the purpose of ascertaining the minimum quantity of sewage to be dealt with, in order to be in a position to reply to the board's letter.

Southwick U.D.C.—The tender of Mr. H. Farrow, of Brixton, at £890 has been accepted for the construction of the surface water outfall sewer.

Spalding U.D.C.—The new sewerage scheme, estimated to cost £20,000, has been adopted.

Worthing T.C.—A scheme has been approved for the construction of new surface-water drains in various streets, and the provision of an additional outfall for surface water at East Worthing, at an estimated cost of £3,430, to be raised on loan. A scheme has also been passed for the provision of additional pumping plant and the new outfall in connection with the sewage outfall works, at a cost of £7,389, to be raised by loan.

WATER, GAS, AND ELECTRICITY.

Bangor U.D.C. The gas manager has been instructed to submit a report of the cost of a small electric plant for the town.

Birkenhead T.C.—An amended plan of the aqueduct in connection with the waterworks undertaking at Alwen, North Wales, has been approved. The estimated cost of the scheme is £10,500.

Dromore U.D.C.—Steps are being taken to introduce a scheme of electric lighting.

Exmouth U.D.C.—The question of the extension of the waterworks has been referred to committee for consideration.

Glasgow T.C.—As the result of the deputation to the Continent and to towns in England and Scotland, experiments in street lighting are being carried out in Bath-street.

Manchester T.C.—A special committee has been appointed to determine the method to be employed for the public lighting of all roads, streets, courts and passages.

Settle R.D.C.—A scheme for an improved water supply, including the enlargement of the storage tank, has been approved, the cost being estimated at £2,000.

Stalybridge T.C.—The council have adopted the proposal of the Gas Committee to lay mains for high-pressure gas lighting, and requested the committee to proceed with the scheme at once.

Stirling C.C.—The council have consented to the execution of certain works with a view to improving the East Stirlingshire water supply, and have sanctioned the borrowing of £5,200 for that purpose.

Ulverston U.D.C.—The reservoirs and filter beds are to undergo immediate repairs estimated to cost £830.

MISCELLANEOUS.

Croydon T.C.—At their last meeting the corporation confirmed a recommendation of their Tramways Committee not to seek powers for constructing further extensions of their tramway system. The advisability of running municipal motor 'buses instead was strongly urged.

Leeds T.C.—Approval has been given to proposals to seek powers for extending both the tramway and trackless trolley routes to a distance aggregating 18 miles.

Lincoln T.C.—Mr. White, chairman of the Electricity Committee, in a statement last week said the committee were seriously considering the question of tramway accommodation for parts of the city not now served. They were not in favour of extending the present system owing to the cost, but were rather in favour of railless cars or petrol-driven 'buses.

Uckfield R.D.C.—A point under the Insurance Act was elucidated in a letter from the Board of Trade giving a decision from an umpire in reference to Part 2 of the Act (Unemployment), to the effect that contributions were payable in respect of workmen engaged wholly or mainly in driving or attending steam road rollers in connection with the construction of new roads, and not merely the re-surfacing of existing roads. The chairman: We are not liable. The clerk: Not until you are making new roads.

PERSONAL.

Mr. J. R. Smith has been appointed surveyor to the Clare (Suffolk) Rural District Council.

Mr. J. P. Haugh, of Chesterfield, has been appointed surveyor to the Pontypridd Urban District Council.

Mr. H. Monson, surveyor to the Redruth Urban District Council, has been voted an increase of salary.

Mr. G. M. Denton, surveyor to the Whitefield Urban District Council, has had his salary increased to £150 a year.

Mr. W. Fiddian, of Stourbridge, has been appointed engineer to the Bewdley water supply scheme of the Stourport Urban District Council.

Messrs. J. Knight and J. A. Phillips, surveyors to the Bodmin Rural District Council, have been granted an increase in their salary to £110 per annum.

Mr. Ernest E. Fetch, of London, has been awarded first and second premiums in the competition for designs for new municipal offices at Goole, and will act as architect for the erection of the building.

Mr. Frederic George Sison Ham, chairman of the well-known firm of Ham, Baker & Co., Limited, passed away at his residence at Wimbledon Park on the 1st inst., we deeply regret to state. The cause of death was typhoid fever.

Mr. H. A. Butterfield, assistant to Mr. J. H. Drew, engineer and surveyor and waterworks engineer to the Wath-upon-Dearne Urban District Council, has been appointed to a similar position in the office of the borough surveyor of Batley, Mr. O. J. Kirby.

FOR OTHER ADVERTISEMENTS

See End of Paper.

APPOINTMENT VACANT.

Applications are invited for the post of Municipal Engineer in the Municipal Board of Cawnpore in the United Provinces of Agra and Oudh, India.

The engagement will be for five years, at a progressive salary of Rs. 800 to Rs. 1,000 per mensem, an increment of Rs. 50 per annum being given after every year of approved service up to the maximum pay of Rs. 1,000 per mensem, but the first increment will be conditional on the passing of a colloquial test in the language of the Province—*viz.*, Urdu. 9¾ per cent will be deducted each month from the salary and paid into the Municipal Provident Fund, and the Municipality will make a contribution equal to one-half of the amount of the deduction made from the salary to the deposit account of the applicant. The agreement will be terminable by six months' notice on either side, provided that, if the applicant gives notice within two years from the date of appointment, he shall refund the sum of £50 granted for passage money, but the engagement may be extended by mutual agreement at the end of the period of 5 years, and if this is desired by both parties, the question of leave allowance during leave and salary will then be considered.

Applicant must be between 28 and 40 years of age, must have practised as a Borough Surveyor or Municipal Engineer for five years, and must hold a recognised diploma in Civil Engineering. Preference will be given to candidates who also possess knowledge and experience of Mechanical Engineering, Waterworks and Maintenance of Macadamised Roads. The salary will commence from the date of the successful applicant's joining at Cawnpore, and an allowance of £50 sterling will be given in full to cover passage and travelling expenses from England to Cawnpore.

Applications, which should be accompanied by a full statement of qualifications, copies of certificates, a medical certificate of sound health, and references to three persons, who may be addressed as to character, should be addressed, not later than 21st November, to

MR. C. E. GOUMENT C.S.I., M.I.C.E.

c/o Messrs. Thos. Cook & Son,
Ludgate-circus,
London.

SINGAPORE, STRAITS SETTLEMENTS.
MUNICIPAL FIRE DEPARTMENT.

The Municipal Commissioners of the Town of Singapore require an Assistant Fire Brigade Superintendent under 32 years of age, and of sound constitution. He must have received a good education, a knowledge of Building Construction and Electricity, a regular training in Mechanical Work, have had experience in the maintenance and repair of Motor Appliances, and have served in a Fire Brigade under a Municipal Fire Superintendent. The engagement will be for three years, and each applicant is to state the earliest date upon which he could be free to leave for Singapore. The selected candidate must pass a medical examination. A second-class passage will be provided by mail steamer, or a first-class passage by other steamer, with half-pay during the voyage out. The salary will be 200 dollars per month for the first year, 220 dollars the second year, and 240 dollars the third year, paid monthly in dollars, the currency of the Colony (the value of the dollar being two shillings and fourpence sterling), with free unfurnished quarters, uniform, light and water. Should the engagement be renewed the salary would be increased by annual increments of 240 dollars up to 3,600 dollars of a maximum per annum. Applications, stating age, and place of birth, and giving details of education, training, and experience generally, and referring to the above requirements seriatim, accompanied by copies only of testimonials, and also personal references, are to be lodged with C. C. Lindsay, Esq., M.INST.C.E., 180 Hope street, Glasgow (who will give further particulars if requested), not later than Tuesday, 22nd October, 1912.

WANTED.—Young engineer on sewer contract. State experience, salary required, and when at liberty.—Contractor, Box 1,186, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

THE RURAL DISTRICT COUNCIL OF HENDON.
JUNIOR ASSISTANT IN SURVEYOR'S DEPARTMENT.

The above Council invite applications for the appointment of a Junior Assistant in the office of their Engineer and Surveyor.

The salary will be £65 per annum, rising £10 annually to a maximum of £95 per annum.

Candidates must have had experience in Municipal Work, and be conversant with the usual routine work of a Surveyor's Office.

Applications to be made on forms, which can be obtained from the undersigned on receipt of a stamped addressed envelope, and the same must be returned not later than 10 a.m. on Wednesday, the 23rd instant.

(By order)
F. J. SEABROOK,
Clerk to the Council.

Union Offices, Edgware.
October 10, 1912.

CROMPTON URBAN DISTRICT COUNCIL.
SEWAGE WORKS MANAGER.

The above Council require a Working Manager to take charge of their Sewage Works, which comprise Precipitation Tanks, Contact Beds, and Sludge-pressing Plant, with Suction Gas Engines and Electrical Plant.

Applications, in own handwriting, stating age, experience, and salary required, accompanied by copies of two recent testimonials, should be sent to the undersigned before 10 a.m. on Monday, 21st October, 1912. It is desirable that applicants should have a good knowledge of Engines and Electrical Plant, as well as experience of sewage treatment.

House and light will be provided free by the Council, and the person appointed will be required to live on the New Hey Works.

Canvassing strictly prohibited.

F. F. GARTSIDE,
Clerk to the Council.

Town Hall, Shaw, nr. Oldham.
October 8, 1912.

BOROUGH OF SOUTHEND-ON-SEA.
TO ROAD AND SEWER CONTRACTORS.

The Corporation of Southend-on-Sea invite Tenders for the Making Up of St. George's Park-avenue; Fairfax-drive, Section 1; Oban-road, Section 2; Ilfracombe-road, Section 1; Tintern-avenue, Section 3; Kingsway; and Back-passage, Strutts Cottages.

Plans, Sections and Specification may be seen and Bills of Quantities and Forms of Tender obtained, on and after Saturday next, the 12th inst., on deposit of a cheque for £1 1s. in respect of each street (which will be returned upon receipt of a *bonâ-fide* Tender and the return of all documents), upon application to Mr. Ernest J. Elford, M.INST.C.E., Borough Engineer and Surveyor.

Sealed Tenders, endorsed "Private Street Works," to be delivered at my office by 9 a.m. on October 17th, 1912.

No Tender will be considered unless made on the prescribed form.

The Corporation will not be bound to accept the lowest or any Tender.

(By order)
H. J. WORWOOD,
Town Clerk.

Town Clerk's Office,
Southend-on-Sea.
October 8, 1912.

TURTON URBAN DISTRICT COUNCIL.
GRANITE SETTS AND TRACTION WAGONS.

Tenders are invited for 13,500 tons of Welsh Granite Setts, and for 2 Traction Wagons.

Specification and Forms of Tender may be obtained from the Surveyor, Council Offices, Bromley Cross, near Bolton. Tenders, under cover, endorsed "Tender for Granite Setts" or "Tender for Traction Wagons," as the case may be, to be delivered to the undersigned on or before Saturday, the 26th October instant.

The Council do not bind themselves to accept the lowest or any Tender.

J. B. GOULBURN,
Clerk to the Council.

Council Offices, Bromley Cross.
October 10, 1912.

Institution of Municipal and County Engineers.

EAST MIDLAND DISTRICT MEETING AT ILKESTON.

(Conclusion.)

Three papers, as will be seen from last week's issue, were submitted for consideration at the recent meeting of the Institution of Municipal and County Engineers at Ilkeston, the contributions in question being: "Ilkeston Sewage Disposal Works," by Hugh P. Raikes, M.INST.C.E.; "Water Supply, Ilkeston," by Henry J. Kilford, borough surveyor and water engineer; and "Ilkeston Tramways and Electricity Supply," by Harry P. Stokes, engineer and manager. The discussion was opened by the president (Mr. R. J. Thomas) with some appreciative references to the general excellence of the papers, their concise nature being in particular commented upon.

Mr. A. G. Wheeler (Eastwood) asked Mr. Raikes the nature of the sewage at Ilkeston. He noticed there were 25 gallons of sewage treated per head per day, and he gathered therefore that the sewage was of a particularly weak character. He would be glad to know something as to the composition of the sewage.

Mr. E. G. Mawbey (Leicester) proposed a hearty vote of thanks to the authors of the three papers. As to the paper on the sewage disposal works, the total flow was given as 25 gallons per head per day; he would like to know why the flow was only equal to 25 gallons per head. The sewers must be very tight. Was there any separate system, and what volume did they expect to have to deal with in storm time? The detritus tanks were formed in a very economical way. The humus tanks were undoubtedly a very important matter. They had seen in a good many works, however good the sedimentation tanks and the percolating filters were, there was always trouble at the other end.

Mr. E. W. Booth (Manchester) said he had not previously seen examples of electrically driven distributors on rectangular beds, though it would be remembered that at Croydon the sprinklers were driven in that way. He would have liked a little more information as to the waterworks—the Meerbrook Sough scheme—shared between Heanor and Ilkeston. He had seen the outside of the pumping station at Whatstandwell, and was looking forward to seeing the inside of it.

Mr. E. H. Crump (Hinckley) asked if there was an explanation for the tremendous amount of leakage from the water mains. It was given as reduced to 25,000 gallons per day, and that, worked out at 6d. per 1,000 gallons, meant a loss of £200 per annum. Probably that had something to do with the loss of £460 per annum. Was the leakage due to subsidences from the collieries? Also, what was the cost per 1,000 gallons of softening the water? The hardness of the water was 22 deg. His authority were considering the matter of softening at the present time, and any information would be useful to him. They had a hardness of 32 deg.

Mr. C. A. Clews (Derby) put an inquiry as to what the joints of the pipes were, how they were made, and where the leakage occurred. He was interested in the Meerbrook Sough scheme, having made the necessary preliminary surveys. Unfortunately, Derby dropped it, as there was a scare as to the pollution of the water. Derby thus lost a very good thing.

Mr. E. J. Elford (Southend-on-Sea) said he had been struck in reading Mr. Kilford's paper by the tremendous difficulties which the latter had had to overcome, and the knock-down blows the council had had from time to time in regard to their water supply scheme. These difficulties had been tackled with great courage, and Mr. Kilford was to be congratulated on the plucky way in which he had stuck to things. With respect to the boring referred to in the paper, the cost of that was given, but in the absence of particulars as to the diameter of the bore that was not of much value. Consideration was being given to a suggestion for utilising the energy provided by the drop between Chadwick Nick pressure and the reservoir—equal to 700,000 gallons of water falling 240 ft. every twenty-four hours—for generating electricity. It was not stated for what purpose this was intended, but if the carrying out of the idea resulted in materially affecting the head of water, he doubted whether it was wise to proceed with it. In regard to the sewage disposal works, he noticed it was stated that the distributors were capable of discharging 500,000 gallons per ¼ acre per twenty-four hours. One million gallons an acre did not seem much, and he should have thought the range would have been much greater than that. In connection with the tramways, he noticed that Atlas joints were now being used, and his opinion was that they were likely to prove satisfactory.

Mr. C. F. Wike (Sheffield) asked whether the provision of 25 gallons per head per day of sewage allowed for storm water, having regard to the requirements of the Local Government Board in that connection. He noticed that a large quantity of granite was to be used for the contact beds. He was just completing works with 30 acres of contact beds and 16 acres of storm-water beds, and had come to the conclusion that slag and furnace and destructor clinker were the best media they could use. They could appreciate the fact that with a quantity of 200,000 tons required some consideration had to be given to the price of the material. They had in proximity to their works a large mound like that of the Stanton Company, which contained, he supposed, 1,000,000 tons of slag and old refuse. They let this to contractors, who thought they were going to get a gold mine, and then found they were getting a dust heap. The difference between 2s. and 3s. per ton of slag and 10s. for granite meant the enormous amount of £40,000 or £50,000. In a district like Ilkeston, where slag was not difficult to obtain, he should like to know why granite was selected. He appreciated the point that granite, when once put down, would last for ever, and could afterwards be used for road material—(laughter)—while slag was very friable. He also knew that not all kinds of slag were suitable; it all depended on whether it was acid or basic slag. The basic was not used because after a time it became very friable.

Mr. R. Oakden (Newark) remarked that sometimes slag would set together in a solid block. He did not know whether Stanton slag would do that. If so, it was rather an objection in a sewage filter.

The President, in putting the vote of thanks to the authors of the papers, said he wished to repeat what he had already said—how much they appreciated the work of Mr. Kilford, especially with regard to the difficulties of the council in getting an efficient water supply. He was told the supply was now admirable, and answered all purposes. The council and Mr. Kilford were to be congratulated on this. As to the matter of the dry-weather flow of the sewage, the previous week at Grays they had a capital table in the paper read by Mr. James, the surveyor, recording very accurate gaugings of his sewers. Speaking from memory, there was no single day when the flow had exceeded five times the dry-weather flow. It was most interesting, and one that should be of great value to members in making applications to the Local Government Board. He would like to know from Mr. Wike where he got that wonderful granite that lasted for ever, and then could be used to make roads. Concluding his remarks, the president said there was one thing in one of the three papers which they should not fail to observe—namely, that they had had brought to their notice the very latest edition of the Raikes' progress. (Laughter.)

The vote of thanks was carried.

Mr. Raikes said he desired to thank the members for the very kind way in which they had received his paper. The description of the works was intended to give them some idea of what they were going to see that afternoon. Mr. Wheeler had spoken as to the nature of the sewage. He mentioned the figure of 25 gallons per day, and was apparently thinking of the small quantity of sewage going through the filters. The reason for such a small quantity per yard was that the sewage was strong. The water supply had been given as 17 gallons her head; so, instead of being a weak sewage, they had an exceptionally strong one. There was no separate system, so it was necessary not only to deal with the sewage, but with surface water as well. Mr. Mawbey spoke of the tank provision, and he need only remark that they attached great importance to the preliminary

tank system. They knew that in some instances disaster had happened from making the bacteria beds do the work for which the tanks were designed. Mr. Booth said he was interested in the system of distribution by mechanically driven travelling distributors. That was perhaps the principal feature of these works, and they had been selected by the Corporation of Ilkeston as being particularly suitable for the conditions there. They wished to take every possible precaution against the disadvantages from the spraying of sewage in the air when it was anywhere near habitations. They had adopted the system of discharging the sewage close to the surface of the filter, so that there was the least possibility of causing any nuisance. It would be seen that the distributing arms were tapered. That was done with the object of reducing their weight and facilitating the distribution. It had the effect of making the arm higher at one end than the other, but it did not cause uneven distribution. The works were only just being brought into use for testing purposes, and had not yet been formally opened; and although they were obtaining an effluent which was better than they expected at this early date, they must not assume it was the effluent which they would get when the works were in order. As to the question of the maximum quantity of sewage on the filters, the statement in the paper was correct that the filters were designed to work at the rate of 1,000,000 gallons per acre per day, which was about the rate they had found satisfactory. Adjustments could, however, be made so as to increase that rate if it was found desirable to do so. The treatment of storm water was important. They had satisfied the Local Government Board by dealing with it in a separate tank before discharge into the river. The question of the material for filters was perhaps the most important of all, because costly works were often built and then filled with rubbish. They had filled some of the filters with slag, but they had not used a larger quantity of slag because they looked upon it more or less as an experiment. They had tested it very thoroughly, and they had had it analysed, and knew exactly what its composition was, but they hardly felt justified in using it on a larger scale. There was also another reason, that it was not possible to get the quantity they required cleaned and screened at the rate they needed it. Time was a matter of importance, and they had not the time to get one material for the whole works. They got different materials, and it would give them an opportunity of comparing results, which would be of use on a future occasion. Mr. Oakden asked whether the slag showed any tendency to solidify into blocks. There was no indication of that, but it might happen with slag which contained any quantity of lime, which would form concrete. Mr. Thomas had mentioned the importance of records of the flow of sewage, so they might know what the works were doing. That was a point they had always appreciated and frequently emphasised, and they were arranging for the automatic recording of the sewage flow at the inlet of the tanks, and another recorder registering the quantity at each section of the beds. They were able in that way so to regulate the flow as to be able to get the best results from each section of the beds.

Mr. Kilford, in replying, stated that the leakage in the water mains was not due to defective works, but was the result of colliery subsidences. His contention was that if one joint could be made watertight 10,000 could be rendered similarly effective, but not in a colliery district. He was unable to give figures as to the cost of softening, but he could obtain them from the Water Board. The great difficulty in connection with the softening was the disposal of the mud following the process of softening. The water was undoubtedly pure. The cost of the boring as given included the cost of the tubes.

Mr. Stokes also replied. The tramway problem was being worked out in Ilkeston, and the point he had tried to emphasise was that it was useless to attempt pumping at the start. It was necessary that the work should be at correct pitch at the very start.

"THE SURVEYOR" BOOK DEPARTMENT.

In response to suggestions from numerous readers, resident in remote districts at home and abroad, who find it difficult to procure the books they require, we have decided to establish a department for the supply of technical and scientific books, a selected classified list of which will shortly be published in our advertisement pages.

THE MANCHESTER APPOINTMENT.

IMPORTANT DEVELOPMENTS.

With reference to the proposed appointment of a deputy city surveyor of Manchester the following appeared in *The Manchester Guardian* of Thursday of last week.

Mr. Derwent Simpson, chairman of the Town Hall Committee, replying to questions on the proposed appointment of a deputy city surveyor at a salary of £500 a year, explained why a change had been made in the advertisement respecting such appointment. By the resolution as at first drafted applications were limited to persons who were full members of the Institution of Civil Engineers. Afterwards, in response to suggestions from members of the council, the advertisement was changed so as to widen the range of applicants.

Mr. Alderman Wilson said that if the chairman of the Town Hall Committee had explained how they were going to advertise for a deputy city surveyor, the committee had surely considered the matter. He did not care at all for the way in which the committee were going to advertise. He felt that it was of no use to consider men who were not full members of the Institution of Civil Engineers.

Mr. West thought they were mistaken in their policy in advertising for an associate member of the institution. They ought to secure the best man they could get. A salary of £500 would not attract suitable candidates. They ought to offer at least £750 a year. He wished to move that the Town Hall Committee should adhere to the original advertisement.

Mr. Alderman Wilson said he would second this.

Mr. Thewlis said that the distinction between an associate member and a full member of the institution was only a class distinction. If the advertisement restricted applications to full members of the institution many men would be prevented from applying for the post. Before a surveyor could have full membership he must be in receipt of at least £500 a year, but full membership had no special bearing on the ability of the man.

Mr. Alderman Wilson: I should like to say nonsense.

Mr. Alderman Walker said that before full membership of the institution could be obtained evidence had to be brought forward that the person desiring the transfer had been engaged in the control and design and carrying out of important work in his profession.

Sir Charles Behrens suggested that the matter should be taken back.

Sir Thomas Shann said there was nothing to take back.

Mr. Swarbrick said he was prepared to move that a deputy city surveyor should be appointed at a salary of £750, and that he must be a full member of the Institution of Civil Engineers.

The Lord Mayor said he thought it would be better if the committee took the matter into further consideration. If Mr. Simpson would move it Sir Charles Behrens would second it.

This course was adopted, and the question was referred back to the committee.

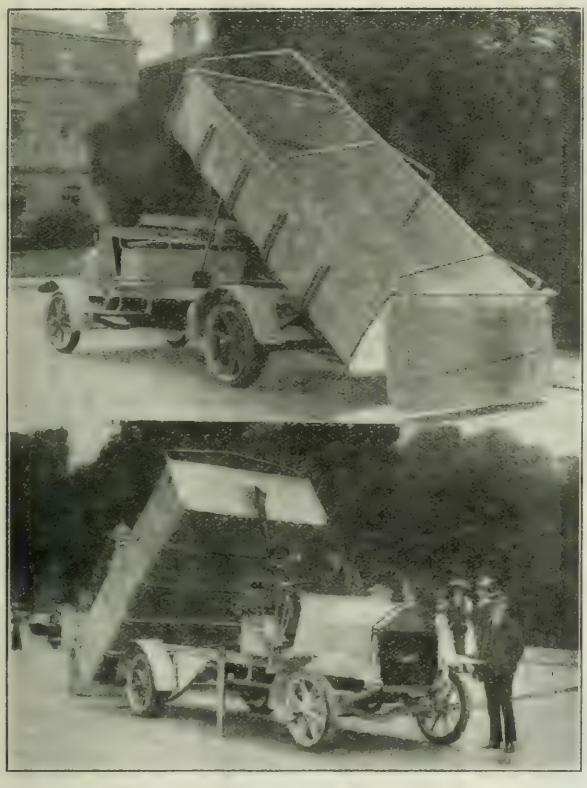
We quote also from *The Manchester Guardian* the following comment as to the foregoing report:

"At the meeting of the Manchester City Council on Wednesday, in the discussion relative to the appointment of a deputy city surveyor, the question arose as to the difference between associates and members of the Institution of Civil Engineers. The council indicated its desire to limit the applications for the appointment to members, but it was argued that the distinction between the two sections was merely a class distinction. A reference to the rules of the institution shows that the distinction is more than one of class. They provide that every candidate for election or transfer into the class of members must be more than thirty-three years of age, and must have had five years' employment in positions of responsibility for the design or execution of important engineering work, and be so engaged at the time of his application for election or transfer. The view taken by the majority in the City Council was apparently that a corporation like that of Manchester, which has often great works in hand—such, for example, as the sewage scheme, which is to cost £1,000,000—should have men of the highest qualification at the head of the city surveyor's department.

STEEL TIPPING REFUSE WAGONS.

The accompanying photographic views depict one of four 38-h.p. 4-ton steel tipping refuse wagons, which the Lacre Motor Car Company, Limited, 78 York-road, King's Cross, London, N., have supplied to the Johannesburg Municipality.

This vehicle is one of the firm's standard 4-ton chassis, with a shortened frame and stiffened at the rear to allow for tipping. The dimensions of this body are about 12 ft. 6 in. long by 7 ft. wide by 2 ft. 9 in. deep, the plates being $\frac{5}{16}$-in. steel, with steel channels and stiffens. The rear part of the body is so arranged that when the vehicle is tipped it opens automatically, and when not tipped is held in position by a lever. The screw fitted is of the telescopic type, and can tip the body to an angle of 45°. Each of these vehicles displaces twelve Scotch carts and twenty mules, and the Johannesburg authorities have written expressing their satisfaction with those with which they have been supplied, and commenting on the great saving in time and labour which their use results in.



The Lacre Steel Tipping Refuse Wagon.

Address Wanted.—Mr. W. H. Williams, late of Ashley-road, Hale, Cheshire, is asked to send his present address to Mr. J. H. Jevons, borough surveyor, Hertford.

The Proposed Western Approach Road.—Heston and Isleworth Urban District Council have submitted to the Road Board a project for diverting the route of the proposed western approach road to London where it passes through the district near Osterley Park. The council desires to divert the new road to the south so as to bring it to a junction with the existing main road at Spring-grove, and then continue it to the north-west to resume the course originally intended. The Road Board have approved the scheme, and recommended the council to petition the Middlesex County Council to promote a bill in Parliament for the construction of so much of the proposed road as lies between Kew Bridge and its original termination near Cranford.

PRIVATE STREET WORKS DISPUTE.

The dispute between a number of property owners in Featherstone and the Featherstone Urban District Council as to the apportionment of the cost of making numerous streets in their Halfpenny-lane district again came before the Pontefract West Riding Bench on Saturday. The matter had been adjourned for a conference between the respective surveyors. Mr. S. Chesney, surveyor to the council, produced his original specifications, showing an estimated expenditure of £5,394. This had since been reduced to £4,994 which was the irreducible minimum—and his figures were supported by Mr. Frank Massey, M.Inst.C.E., Wakefield, and Alderman Arthur Hartley, Castleford, chairman of the West Riding County Council Highways Committee. He considered nothing short of tar macadam would do for the roads. The county authority had tried tarred dross, and were finding it unsatisfactory. On the other hand, Mr. T. H. Richardson, surveyor to the Hemsworth Rural District Council, said his estimate, based on many years' experience of similar road making at Hemsworth, was £400 below Mr. Chesney's final figure; and Mr. Edward Brooke, surveyor to the Ardsley Rural District Council, gave similar evidence.

The bench reduced the council's estimate by £400, to £4,594, suggesting that Mr. Chesney and Mr. Richardson should again meet together and apportion that amount. The bench considered that tar macadam and Leeds steel dross could safely be substituted for limestone, and that the pitching under the kerbstone was unnecessary. They ordered the costs of the first hearing to be divided, and those of Saturday to be borne by the council.

An Exceptional Opportunity.—In these days when the dangers of "blind alley" occupations for young people are realised, the announcement made in our advertisement columns by Messrs. Herbert Morris, Limited, is specially interesting. This firm, who are makers of lifting machinery to, *inter alia*, the Admiralty, the War Office, the India Office, and the Royal dockyards, offer free opportunities of training, with wages from the commencement, in their engineering works, drawing offices, clerical and commercial departments. These posts, which are to be filled at once, are intended only for those who are willing to work well and are desirous of getting on in the world; and the offer is one of which advantage will doubtless be taken by many parents who have the responsibility of giving their children a good start in life.

Municipal Engineering (Edited by Sydney G. Turner, Assoc.M.Inst.C.E. Price 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.).—This volume consists of model answers to questions set at recent examinations of the Institution of Municipal and County Engineers, and is the second edition. It is practically identical with the first issued. It is not suggested that it should take the place of recognised text-books, but it provides useful summaries of various subjects, as well as indications as to how different types of questions may be answered. Every effort has been made to render the answers as accurate and comprehensive as possible, though they contain more than a candidate would be expected to supply. The answers are founded upon examinations held in Birmingham, London and Manchester. The appendix contains examples of questions on sewerage, sewage disposal, tramway construction, bridges, water supply, road construction, buildings, sanitary science as applied to towns and buildings, drainage, and other matters.—*Local Government Journal.*

Sewage Disposal at Barnsley.

By J. HENRY TAYLOR, M.INST.C.E.

[The appended notes form part of an address which the author, the engineer for the undertaking which they describe, delivered at a recent meeting of the Association of Managers of Sewage Disposal Works held at Barnsley.]

In connection with the treatment of the sewage of Barnsley, I may mention that the earliest attempts or proposals for that purpose were made by the late Mr. Thomas Hawksley about forty years ago. He proposed to put down filters very much nearer to the town than our present works, but beyond his designs on paper no actual works were carried out by him. Then in the year 1876 Mr. J. Bailey Denton, who at that time was devoting nearly the whole of his time to preparing designs for the treatment of sewage in various parts of the country, was called in by the then Corporation of Barnsley, and they adopted his scheme of intercepting and outfall sewers and of the laying out of about 76 acres of land for the treatment of sewage by intermittent downward filtration.

The land for the purpose was purchased at a very high price, averaging about £296 per acre, inclusive of the costs of an expensive arbitration; but the quality of the land was not very suitable for the purpose, much of it being of a stiff clayey character. Partly on account of the character of the land and of its insufficient area for the quantity of sewage poured upon it, and partly in consequence of the land subsiding through the working of coal immediately under it, the results, so far as purification was concerned, were not good. Ultimately the Rivers Board of the West Riding came upon the scene, and although they exhibited a great deal of consideration for the Corporation of Barnsley, and Dr. Maclean Wilson, their chief inspector, was very patient and courteous, the pressure that they put upon the corporation, together with the fact that the effluent was undoubtedly bad, caused the corporation to undertake the works that are now completed.

NEW WORKS.

These were designed by myself, and have been about nine years in carrying out. The total cost has been between £37,000 and £38,000, including £5,000 for land. The whole of the work has been carried out by contractors. The two principal contractors, Mr. William Cunliffe and Messrs. Elvins & Sons, came from Birmingham, and they have both done credit to themselves by the excellent manner in which the works have been carried out and the good class of the works constructed by them.

Barnsley is a town containing a great variety of trades. . . . The estimated dry-weather flow of sewage that is treated from a population of about 51,000 is 1,250,000 gallons per day, and this contains about 5 per cent of liquid trade refuse from breweries, bleach works, and dyeworks chiefly.

The configuration of the district renders it necessary to have two zones or systems of collection of the sewage, the high-level district sending nine-tenths and the low-level one-tenth of the sewage. The high-level sewage is conveyed through the various branch and intercepting sewers into the straining tanks, and from the last named it is conveyed through a 20-in. metal syphon pipe, 2 miles long, to the detritus and septic tanks. Thence it proceeds on to nine circular sprinkler continuous filters, and subsequently into the humus tanks, and from these on to secondary filters, or on to about 40 acres of land which has already been prepared for irrigation purposes, with under drains about 6 ft. deep. The effluent then passes into the adjacent river Dearne.

The secondary filters were originally constructed as storm-water filters, and are now used either as storm-water filters, or for finally filtering the effluent from the primary filters. We have no storm-water settling tanks.

The low-level sewage is conveyed by the old intercepting sewer, which was laid nearly forty years ago, and is diverted into detritus and storage tanks at Cliffe Wood. Here it is pumped up by a suction gas engine and centrifugal pump over a standpipe 55 ft. high and connecting to the 20-in. high-level main, the sewage of the low and high level joining at the point and flowing together to the purification works.

The total area of the borough of Barnsley is 2,384 acres, 1,500 of which drain naturally into our present sewerage system and sewage works, the remainder of the area being chiefly agricultural land draining into the river Dove. The nett area of the buildings, yards and roads which drain into our sewers is about 400 acres. The average rainfall of Barnsley is about 23 in.

SEWERAGE.

Barnsley is chiefly sewered on the separate system, but the sewage proper includes surface water from some streets which at present are not separately drained and the drainage from the back roofs and back yards and back roads. It will readily be seen that when the dry-weather flow of sewage to be treated amounts only to 24 or 25 gallons per head per day, and that as this quantity includes some surface water and subsoil water, as well as liquid trade refuse, we are entitled to claim to be very largely on the separate system of sewerage.

Barnsley is partly on the water-closet system and partly on the privy and ashpit system, but as fast as we possibly can we are converting the whole of the privies into water-closets, with the result that at the present time five-sixths of the population are already on the water-closet system. For many years, owing to the rapid growth of Barnsley and district, the water supply was insufficient to allow of the adoption of water-closets universally, but owing to the enterprise of the corporation and the success of the waterworks constructed for the supply of the district, we are now able to give a free supply of water to the first water-closet in each house; where a person has more than one water-closet he pays the water rate for every one fixed after the first.

THE PURIFICATION PLANT.

The general description of the purification works themselves is as follows:—

There are four detritus tanks, each 20 ft. by 15 ft. by 3 ft., and eight septic or sedimentation tanks, each 80 ft. by 40 ft. by 7 ft. There are eight circular percolating filters, each 100 ft. in diameter, and one filter 120 ft. in diameter. The filtering material, which is 6 ft. in depth, consists of about 3 ft. of small broken gritstone in the lower and 3 ft. of small broken washed furnace slag in the upper part. Both the stone and the slag are graduated in size from 2½ in. to ½ in., the larger pieces being at the bottom of the filter and the smaller at the top.

The whole of the tanks and the floors of the filters are of cement concrete, 5 to 1, and the stone (except ashlar) for the whole of the works and filtering material has been obtained from the quarry which has been opened out for the purpose on the corporation's land immediately adjacent to the filters.

No precipitants are used in the works, and the whole of the sludge from the straining, detritus and septic tanks is disposed of on portions of the farm and other lands of the corporation—which are fortunately ample for the purpose.

The quantity of sludge taken out of the sewage at the screening chamber and the detritus and septic tanks I estimate at 1,450 tons per annum. We do not propose under present circumstances to press the sludge as we have ample agricultural and waste land near the works on which we at present store the material. We are hoping that when farmers have had opportunities of testing the sludge that they will readily come for it when it is in a dry state and use it as a fertiliser.

The chemical analysis some months ago of the crude sewage and of the effluent shows 86 per cent of purification; to-day, however, the percentage is higher.

The annual expenditure and revenue for the year 1911-12, including farming operations, was as follows:—

Payment of interest and sinking fund, which includes the old original works (which cost £45,000)	£3,155
Payment of other charges, such as material, labour, team labour, plant, seeds, rents, rates and taxes, insurance, horses' food and bedding, pigs and pigs' food, repairs and renewals	1,941
	£5,096

Brought forward	£5,096
The revenue from sale of crops, value of stores, &c., was	515
Nett annual working cost	£4,581
The interest and sinking fund payments are equal to a rate of ...	5d. in the £.
The general charges are equal to a rate of	3d. in the £.
Total	8d. in the £.

But after allowing for the receipts £515, the loss on working account is equal to 7¼d. in the £.

SOME RECENT PUBLICATIONS.*

The Rating of Gas and Water Undertakings. By Arthur Valon, Assoc.M.Inst.C.E. Price 3s. 6d. nett. London: Walter King.

The difficulty of applying the statutory definitions of "gross value" and "rateable value" to such special properties as gas and water undertakings, and so forth, has led to the adoption of a stereotyped artificial method of estimating the rent which the hypothetical tenant would pay. The valuation of such properties for rating purposes is, therefore, a highly technical matter, and the author of the present work has endeavoured to elucidate the various matters which have to be taken into consideration. He deals separately with each class of undertaking, and model valuations are given with full explanations of the figures used. The general procedure to be followed on making a rate or when appealing is set out; and although the work has no pretensions as a legal manual, the judgments in the leading cases are set out in full as appendices. Mr. Valon's book will be found a concise and useful guide to those who have to deal practically with a difficult subject.

Reports of Rating Appeals, 1909-1912. By E. M. Konstam and Harold R. Ward, Barristers-at-law. Price 16s. London: Butterworth & Co.

This volume forms a continuation of the series at first edited by Mr. Walter Ryde, K.C., in which the last collection of reports, by Mr. Konstam, appeared in 1908. To those whose business takes them into the Courts in which rating appeals are decided these reports will be well known and their value will be sufficiently appreciated. The present volume is similar to its predecessors both as regards general arrangement and the care and accuracy with which it has been produced. All the important rating cases for the period covered by the book are included, and among them are cases concerned with the valuation of railways, licensed premises and electrical undertakings. The case of *West Kent Main Sewerage Board* v. *Dartford Union*, in which the House of Lords decided that all sewers are rateable, is reported. Rating surveyors who wish to keep themselves abreast of the most modern developments in the law cannot well afford to do without this book.

A municipal engineer enquires the title, author's name, and price of a book containing tables of sinking funds, simple and compound interest, &c. The work consists entirely of such tables, and is, so our correspondent says, largely in use in the offices of borough engineers. Can any reader oblige with the required information?

Bridge Building.—Students, young engineers, and surveyors will find much useful information in "Preliminary Studies in Bridge Building," by Reginald Ryves, Assoc.M.Inst.C.E. (London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.) The book is described as the "first of a series of small volumes, each complete in itself, dealing with the design of ordinary highway bridges of moderate span." Though highway bridges alone are referred to, the matter contained in this volume is largely applicable to railway bridges, aqueducts, and similar engineering undertakings. The five primary types of bridges are described, and the conditions determining the best site for each of the three types of streams are discussed in detail; while, in connection with wandering streams various modes of designing abutments or approach spans are dealt with. Improvements of fords and the effect of eccentric loading of vehicles on the girder loads are among the numerous other items touched on. —*Scotsman.*

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Ltd., on receipt of published price.

FILTRATION OF WATER.

CONTROLLING ARRANGEMENTS ON SAND FILTERS.

Every engineer who has been concerned in the filtration of water by slow sand filters is familiar with the importance of being able to control the rate of filtration, and of having it under easy observation. We illustrate herewith the arrangement recently adopted at the Hereford Corporation waterworks for

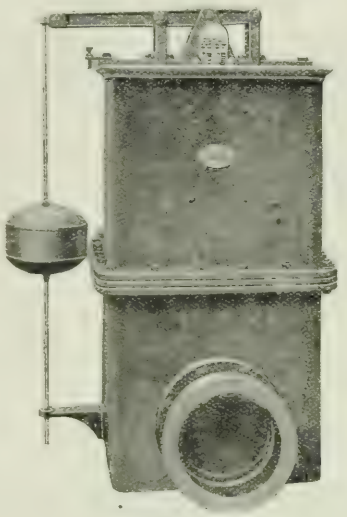


Fig. 1.

two new sand filters recently constructed by the city engineer, Mr. John Parker, Assoc.M.Inst.C.E. The arrangement forms the inlet to the filter for the water received from the subsiding reservoir, and consists of a cast-iron box (Fig. 1) divided into two chambers

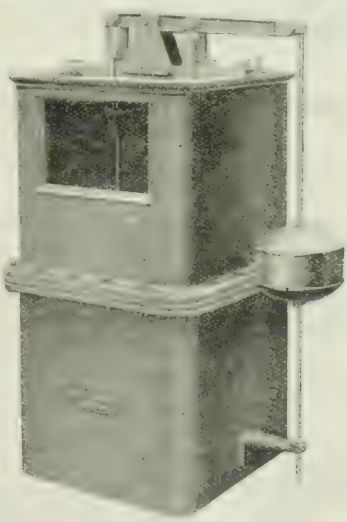

Fig. 2.

by a horizontal division plate near the middle. The opening in the lower chamber is connected to the inlet pipe to the filter, which is controlled by the usual sluice valve. In the division plate are two gun-metal valve seatings (one on the upper and the other on the lower face of the plate), provided with valves which are connected by vertical rods to a horizontal lever, fixed on the top of the upper chamber of the tank. The rods are connected to the lever at equal distances on each side of the fulcrum, so as

to be in equilibrium. At the end of the lever, and overhanging the water in the filter, is a vertical rod carrying a float which is adjustable along the rod.

To the interior of the upper chamber is bolter a small cast-iron box open at the bottom, containing a small copper float carrying an enamelled scale which passes through a slot in the cover placed about level with the top of the tank. The scale is graduated to indicate on one edge the gallons per hour discharged on to the filter, and on the opposite edge the rate in inches of depth per hour at which it is percolating through. On the outlet side of the tank (Fig. 2) is an opening 18 in. in width, with a weir edge over which the water is discharged on to the filter. The position of the small float is so arranged that when the water in the tank is at weir level the scale is at zero above the float-box cover.

To put the filter into operation the man in charge opens the inlet sluice, which is placed behind the gauge tank, with the float scale immediately in front of him, until the scale indicates that water is passing through the gauge opening at the maximum rate at which he desires the filtration should proceed. From that time the rate is automatically controlled until the surface of the filter has become so sealed as to be incapable of passing sufficient water to continue its use, when the bed is reskimmed. As the surface of the filter closes, and diminishes the quantity of water, it is capable of passing at the head at which it was started, the water over the sand rises till it reaches a few inches below the overflow pipes, when it causes the larger float to rise and reduce the opening of the valves, thus diminishing the quantity of water discharged on to the filter, so as to suit its diminishing capability of passing it.

Not only does the apparatus give perfect control over the rate of filtration from the time the filter is started until it requires reskimming, but as the scale at a glance indicates from time to time the diminished quantity taken by the filter, the person in charge knows precisely its condition and how soon it will need reskimming. The valves are arranged to close entirely before the water over the sand reaches the overflow pipes.

The apparatus has been in use at the Worcester waterworks for the past ten years, and was devised by Mr. T. Caink, Assoc.M.Inst.C.E., city and waterworks engineer of that city, and is manufactured by the Nevile Engineering Company, Worcester.

The width of outlet opening to the filter, and the graduations of scale, have to be adapted to the size of the filter to which it is applied.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. R. J. Thomas, M.Inst.C.E., County Surveyor, Buckinghamshire.

NORTH WALES DISTRICT MEETING, WREXHAM.

District Chairman—Mr. Wm. Jones, Assoc.M.Inst.C.E., Colwyn Bay.

A North Wales District meeting will be held at the Free Library, Queen-street, Wrexham, on Saturday, October 19th.

Programme.

11.30 a.m.—Meet at Free Library, Queen-street. Members will be received by the mayor.
11.45 a.m.—Inspect markets, fire station, electricity works and Willow depot.
1 p.m.—Luncheon at Wynnstay Hotel, by the kind invitation of the mayor.
2 p.m.—Drive to sewage farm.
3 p.m.—Return to Wrexham. Formation of District Executive Committee. Discussion on paper entitled "Wrexham and its Municipal Works," by Mr. J. England, borough surveyor (member).
4 p.m.—Light Refreshments, provided by borough surveyor.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than to-morrow (Saturday).

J. England,
Hon. District Secretary.

Thomas Cole,
Secretary.
11 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. E. A. Stickland, Assoc.M.Inst.C.E., Borough Surveyor, Windsor.

President-Elect—Mr. Frank Latham, M.Inst.C.E.I., F.S.E., Borough Engineer and Surveyor, Penzance.

ANNUAL GENERAL MEETING.

The fourth annual general meeting of the Institution of Municipal Engineers will be held in London to-day (Friday) and to-morrow (Saturday).

Programme.

To-day.

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.
11.15 a.m.—Annual general meeting:—
Minutes of last meeting.
Election of council for the year 1912-13.
Presentation of annual report of council.
Announcement of result of ballot.
Presidential address.
1 p.m.—Adjourn for lunch.
2 p.m.—Reassemble in council chamber.
2.15 p.m.—Discussion on the following papers to be presented to the meeting:—
"The Modernising of Building By-laws," by F. W. Platt (member).
"The L.G.B. Report on Intercepting Traps," by H. C. H. Shenton (member).
"The Influence of Town Planning upon the Public Health," by W. Louis Carr (member).
"Superannuation and Security of Tenure," by A. Winter Gray (member).

The papers will be taken as read.

5 p.m.—Close of meeting. Ladies return to council chamber.

Ladies' Meeting.

(Held concurrently with General Meeting.)

11 a.m.—Meet in the council chamber, No. 4 Southampton-row, London, W.C.
11.15 a.m.—Leave council chamber and proceed to the stores of Messrs. Selfridge & Co., Oxford-street, W.
11.30 a.m.—Meet at the Duke-street entrance of the stores, where visitors will be met by a representative of the firm and conducted round the building.
1 p.m.—Lunch.
2.30 p.m.—Meet at the showrooms of Messrs. Doulton & Co., Limited, Lambeth, S.E., who have kindly arranged to conduct the visitors through their works and showrooms.
4.30 p.m.—Leave Messrs. Doulton's works.
5 p.m.—Arrive at council chamber, Southampton-row.

6.45 p.m.—Reception by the president at the Holborn Restaurant, followed by (7 p.m. to 11.30 p.m.) social evening, with musical programme, at the invitation of the president. Morning dress.

To-morrow.

10.30 a.m.—Visit to Shakespeare's England, Earl's Court. Meet in booking hall, Earl's Court Station.
12.30 p.m.—Adjourn for lunch.
2.30 p.m.—Visit to the London Hippodrome, at the request of a number of country members.

EASTERN DISTRICT MEETING, GODMANCHESTER.

(Tuesday, October 15th.)

Programme.

11.30 a.m.—Meet at Godmanchester Station and inspect Roxmac road.
12.30 p.m.—Call at council's depot, where methods of sewer flushing will be shown.
Inspect reinforced concrete bridges.
1 p.m.—Lunch at the Horseshoe Temperance Hotel.
2 p.m.—Reception at the town hall by his Worship the Mayor (Mr. J. P. L. Durrell Stables, J.P.).
Inspect old charters, books and records.
3 p.m.—Walk round town, viewing sixteenth century architecture, tarviated roads, reinforced concrete posts, new system of constructing

cheap cottages and "exhibition" of cheap cottages.

4 p.m.—Tea at the Horseshoe Temperance Hotel.

PHILIP S. BENNETT,
Council Offices, *Hon. District Secretary.*
Ramsey, Hunts.

YORKSHIRE AND NORTHERN DISTRICTS.

A joint meeting of the above wil be held in Harrogate on Saturday, October 19th.

PROGRAMME.

(Arranged by kind permission of the Harrogate Corporation.)

11.15 a.m.—Meet at Harrogate Station.

11.30 a.m.—Drive by motor char-a-banc to Corporation Depot, Wetherby-lane, to inspect new tar-macadam mechanical mixing plant (supplied by Messrs. Ord & Maddison, Darlington), and stone-breaking machine in operation.
Light Refreshments.

12.45 p.m.—Drive to North sewage outfall works, new septic tanks and percolating filters, new aërating sprinklers and special apparatus for treatment of sludge.

1.30 p.m.—Drive to Royal Baths. There are eighty-six different treatments, the principal ones of which will be explained and viewed.

2.45 p.m.—Drive to Iron Gate reservoir. Sand-bed filters.

3.15 p.m.—Drive to Harlow Hill reservoir. Candy-Whitaker's mechanical filters.

3.45 p.m.—Drive to corporation stables and Town's Yard, Robert-street.

4.15 p.m.—Drive to corporation fire brigade station New Merryweather's motor fire engine.

4.30 p.m.—Dinner at North-Eastern Hotel, Station-square.

A short meeting of the Yorkshire members will be held to discuss proposed rearrangement of district.

Members are earnestly requested to advise the secretary as early as possible if it is their intention to be present.

H. J. FIRTH.
Hon. District Secretary, Yorkshire District.
JOHN ROBINSON.
Hon. District Secretary, Northern District.

SUBSCRIPTIONS, 1912-13.—Members and others are requested to note that annual subscriptions for 1912-13 are now due.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

ROYAL SANITARY INSTITUTE.

PROVINCIAL SESSIONAL MEETING, ALTON.

On Saturday, October 26th, a sessional meeting of the Royal Sanitary Institute will be held in the Assembly Rooms, Alton, at 11.15 a.m., when discussions will take place on "Housing Problems in County Areas," to be opened by Dr. Robert A. Lyster, county medical officer of health, Southampton, and "Municipal Work in Alton" to be opened by Mr. G. Bertram Hartfree, F.S.I., surveyor to the urban district council. Among those who are expected to take part in the discussion are Messrs. R. W. Cass, surveyor to the Farnham Urban District Council; C. G. Mason, ASSOC.M.INST.C.E., borough engineer, Guildford; W. J. Taylor, M.INST.C.E., county surveyor, Southampton; and F. C. Uren, M.INST.C.E.I., surveyor to the Aldershot Urban District Council.

The chair will be taken by Mr. H. Percy Boulnois, M.INST.C.E., chairman of the council of the institute.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Ltd. Price 10s. 6d.

THE LATE MR. G. EEDES EACHUS.

AN EDMONTON MEMORIAL.

A three-quarter size oil painting of the late Mr. G. Eedes Eachus, who was formerly engineer and surveyor to the Edmonton (Middlesex) Urban District Council, will be unveiled by Mr. H. T. Wakelam, M.INST.C.E., the county surveyor, in the council chamber of that authority on Monday evening next at 6 o'clock.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

HIGHWAYS FOREMAN.—October 12th.—Deptford Borough Council. £2 per week.—Mr. V. Orchard, town clerk.

SURVEYOR'S CLERK.—October 12th.—Frimley Urban District Council. £52 per annum.—Mr. T. C. Jones, surveyor, Municipal Buildings, Camberley.

HIGHWAY SURVEYOR.—October 14th.—Truro Rural District Council.—Mr. Coulter Hancock, solicitor.

INSPECTOR OF NUISANCES.—October 14th.—Northfleet Urban District Council. £130 per annum.—Mr. C. E. Hatten, clerk.

INSPECTOR OF NUISANCES.—October 15th.—Kettering Urban District Council. £130 per annum.—Mr. J. Bond, clerk.

GENERAL FOREMAN.—October 15th.—Whitefield Urban District Council. £2 per week.—Mr. Chas. Brad-haw, clerk. Applications to be endorsed "Foreman."

SECOND ASSISTANT.—October 15th.—Romford Rural District Council. £105–£120 per annum.—Mr. T. W. A. Greenhalgh, clerk. Applications to be endorsed "Surveyor's Assistant."

CLERKS OF WORKS (2).—October 16th.—Chapel-en-le-Frith Rural District Council. £2 10s. and £2 2s. per week.—Mr. J. B. Boycott, clerk, Union Offices.

SEWAGE WORKS MANAGER.—October 16th.—Padiham Urban District Council.—Mr. J. Gregson, surveyor.

INSPECTOR OF NUISANCES.—October 19th.—Patrington Rural District Council.—Mr. L. A. Milton, clerk.

COUNTY SURVEYOR.—October 19th.—County of the Soke of Peterborough. £200 per annum.—Mr. Walter J. Deacon, clerk, Cross-street, Peterborough. Applications to be endorsed "Application for County Surveyorship."

JUNIOR SURVEYOR AND DRAUGHTSMAN.—October 21st.—East Sussex County Council. £65 per annum.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

SURVEYOR'S ASSISTANT.—October 22nd.—Wath-upon-Dearne Urban District Council. £85 per annum.—Messrs. Nicholson & Co., clerks.

CHIEF ENGINEER.—October 28th.—Municipality of Karachi (India). 500–750 rupees per month.—Mr. Measham Lea, chief officer and chief engineer, Municipal Office, Karachi.

ASSISTANT SURVEYOR OF ROADS.—Public Works Department of the Gold Coast Government. £300—£350, with allowances.—Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W. Quote M 5,497 on left-hand top corner of application.

With regard to the Manchester vacancy noted in this column last week, it will be seen elsewhere in this issue that the terms of the appointment are being reconsidered by the city council.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1359 Holborn), subject to later confirmation by letter.*

WANDSWORTH.—October 14th.—Competitive designs for public swimming bath at Balham.—Mr. P. Dodd, borough engineer, 215 Balham High-road, S.W.

GLASGOW.—October 29th.—Preliminary sketch designs are invited by the corporation for the extension of the municipal buildings. Honorariums of 100 guineas to five selected designs.—Mr. John J. Burnet, A.R.S.A., 239 St. Vincent-street, Glasgow, is assessor.—Applications to the clerk, Mr. J. Lindsay, town clerk.

LLANDUDNO.—October 31st.—Designs for laying out about 20 acres, for the urban district council. A premium of 50 guineas is offered.—Mr. A. Conolly, clerk.

HUDDERSFIELD.—October 31st.—Designs for laying out certain areas as a town planning scheme, for the corporation. Premiums of 100, 50, and 25 guineas. —Mr. J. Henry Field, town clerk.

ROSCREA.—November 1st.—Plans, specifications, and estimates of a complete sewerage scheme, for the No. 1 Rural Council.—Mr. Thomas Dooly, clerk, Roscrea Workhouse.

CARLISLE.—December 2nd.—School buildings, for the corporation.—City Surveyor, 36 Fisher-street, Carlisle.

ORSETT (Essex).—January 1st.—For the construction of a sewerage and sewage disposal scheme in the parish of South Ockendon, for the Orsett Rural District Council. Premiums of £50 and £25 are offered.—Mr. James Beck, clerk, 2 Orsett-road, Grays.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* **Wednesdays** *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (No. 1339 Holborn), subject to later confirmation by letter.*

Buildings.

HARROW.—October 12th.—For the construction of two conveniences, for the urban district council.—Mr. J. Strachan, clerk.

CORNWALL.—October 12th.—For alterations to a school, for the Education Committee.—Mr. F. R. Pascoe, secretary, County Hall, Truro.

WEDNESBURY.—October 14th.—For the erection of a building and shed at isolation hospital, for the corporation.—Mr. T. Jones, town clerk.

TIPTON.—October 14th.—For setting a Lancashire boiler at gasworks, for the urban district council.—Mr. S. O. Stephenson, engineer, Gasworks.

HECKMONDWIKE.—October 14th.—For the erection of stone boundary walls at the cemetery, for the urban district council.—Mr. James Saville, surveyor.

ECCLES.—October 14th.—For taking down bowl-house and erecting new pavilion, bowl-house and shelter, for the corporation.—Mr. Edwin Parkes, town clerk.

SPALDING.—October 15th.—For building thirty-six cottages, for the urban district council.—Mr. H. H. Harvey, clerk.

WATFORD.—October 15th.—For the construction of a public convenience, for the urban district council.—Mr. D. Waterhouse, engineer and surveyor.

BRAY.—October 15th.—For the erection of sixty-four dwellings, for the urban district council.—Mr. P. MacDonnell, clerk.

STOCKPORT.—October 15th.—For the erection of shelter, tool-house and conveniences, for the corporation.—Mr. J. Atkinson, borough surveyor.

BRISTOL.—October 16th.—For the erection of muniment rooms, for the corporation.—Mr. P. Addie, city valuer, The Exchange.

HERNE BAY.—October 16th.—For the erection of a pavilion and concert hall, for the urban district council.—Mr. G. H. Beetenson, clerk.

LANCS.—October 17th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, 16 Ribblesdale-place, Preston.

ELLOE.—October 17th.—For the erection of cottages, for the rural district council.—Mr. S. S. Mossop, clerk, Holbeach

DORSET.—October 18th.—For the erection of an elementary school, for the county council.—Mr. Clement G. Bone, secretary, County Offices, Dorchester.

WEST RIDING.—October 18th.—For alterations to a school, for the county council.—The Clerk, County Hall, Wakefield.

AYLESBURY.—October 18th.—For the erection of nurses' room at the isolation hospital, for the urban district council.—Mr. W. H. Taylor, engineer and surveyor.

BRECON.—October 18th.—For the erection of a public school, for the Education Committee.—Mr. C. W. Burt, surveyor, County Hall, Brecon.

SOUTH WESTMORLAND AND ULVERSTON.—October 19th.—For erecting a stone arch bridge, for the rural district council.—Mr. A. Milne, Lowther-street, Kendal.

IPSWICH.—October 19th—November 11th.—For the erection of a school, for the Education Committee.—Mr. J. H. Hume, secretary, Education Offices, Tower House, Ipswich.

MONMOUTH.—October 21st.—For the erection of a domestic arts centre, for the Education Committee.—Mr. C. Dauncey, secretary, County Council Offices, Newport.

PORTSMOUTH.—October 21st.—For the erection of a school, for the Education Committee.—Mr. G. Hammond Etherton, town clerk.

HENDON.—October 21st.—For the erection of fifty artisans' dwellings, for the urban district council.—Mr. H. Humphris, clerk.

HENDON.—October 21st.—For the erection of a fire station, for the urban district council.—Mr. H. Humphris, clerk.

SOUTHAMPTON.—October 21st.—For the reconstruction of Fore Bridge, Petersfield, for the county council.—Mr. H. Barber, clerk, The Castle, Winchester.

KNOWLE.—October 22nd.—For the erection of three pairs of semi-detached cottages at the county asylum, for the Visiting Committee.—Mr. J. R. Wyatt, clerk, Hants County Asylum, Fareham.

WILLESDEN.—October 22nd.—For the construction of a public convenience, for the urban district council.—Mr. O. C. Robson, engineer, Municipal Offices, Kilburn.

PERTH.—October 23rd.—For piling 230 yds. of the river bank with larch piles and pitching slopes, for the corporation.—Burgh Surveyor.

DEVON.—October 24th.— For alterations at certain county schools, for the Education Committee.—The Architect, 1 Richmond-road, Exeter.

NORTHUMBERLAND.—October 25th.—For the erection of out offices and alterations to school, for the Education Committee.—Mr. C. Williams, secretary, The Moothall, Newcastle-upon-Tyne.

NORTH RIDING.—October 29th.—For the erection of a school, for the Education Committee.—Mr. E. G. Fletcher, architect, Prince Regent-street, Stockton-on-Tees.

ESSEX.—October 30th.—For the erection of a school, for the Education Committee.—Mr. H. J. Goodwin, clerk, Education Offices, Loughton.

WANSTEAD.—November 7th.—For the erection of a fire brigade station, for the urban district council.—Mr. C. H. Brassey, surveyor.

Iron and Steel.

ROTHERHAM.—October 12th.—For excavating, laying, jointing, and filling in 21 miles of cast-iron spigot and socket pipes, the sizes ranging from 8 in. to 3 in., for the rural district council.—Messrs. Oxley and Coward, clerks.

ROTHERHAM.—October 12th.—For the supply of 1,330 tons of cast-iron spigot and socket pipes with special castings, for the rural district council.—Messrs. Oxley and Coward, clerks.

WARRINGTON.—October 14th.—For the supply of wrought-iron unclimbable hurdles and gates, for the corporation.—Borough Surveyor.

STOKE-ON-TRENT.—October 14th.—For the supply of second-hand tramway rails, for the corporation.—Mr. E. B. Sharpley, town clerk.

NEWTON ABBOT.—October 23rd.—For laying cast-iron water mains, for the rural district council.—Mr. F. Horner, clerk.

WINTERTON.—October 23rd.—For the supplying and laying water mains, for the urban district council.—Mr. Norman Gibson, clerk.

Roads.

HARROW-ON-THE-HILL.—October 12th.—For making up private streets, for the urban district council.—Mr. J. Strachan, clerk.

COCKERMOUTH.—October 12th.—For widening a roadway, for the rural district council.—Mr. J. H. Musgrave, clerk.

KENSINGTON.—October 14th.—For making up portion of a highway, for the borough council.—Mr. W. Chambers Leete, town clerk.

DARTFORD.—October 14th.—For making up certain private streets, for the rural district council.—Mr. Eustace J. Hobbs, clerk.

WANDSWORTH.—October 14th.—For repairing parts of two roads in Southfields, for the urban district council.—Mr. D. A. Nicholl, town clerk.

WEST SUSSEX.—October 14th.—For the supply of about 150,000 gallons of tar, for the county council.—Mr. H. W. Bowen, county surveyor, 23 North-street, Horsham.

BROADSTAIRS.—October 14th.—For the supply of granite-macadam, pit flints, pit gravel, hire of steam roller and scarifier, and laying limestone tar paving, for the urban district council.—Mr. H. Hurd, town surveyor.

MANCHESTER.—October 14th.—For work of asphalt paving, for the corporation.—Mr. Thomas Hudson, town clerk.

WARRINGTON.—October 14th.—For paving seven streets and seventeen passages, for the corporation.—Mr. Andrew M. Ker, borough engineer and surveyor.

LANARK.—October 14th.—For the construction of a new highway, for the Middle Ward:—Mr. W. E. Whyte, district clerk, Hamilton.

BURY.—October 14th.—For kerbing, flagging and paving, for the corporation.—Town Clerk.

SHEERNESS.—October 15th.—For the supply of basalt or granite, Kentish ragstone, hoggin and Thames ballast, for the urban district council.—Mr. V. H. Stallon, clerk.

GLYNCORRWG.—October 15th. — For making-up work in several streets, for the urban district council.—Mr. W. P. Jones, surveyor.

HORSFORTH.—October 15th.—For making up certain streets, for the urban district council.—Mr. H. Raven, surveyor.

WEMBLEY.—October 15th.—For the work of street improvement, for the urban district council.—Mr. C. R. W. Chapman, engineer and surveyor.

GUILDFORD.—October 16th.—For making up approach to isolation hospital, for the corporation.—Mr. A. D. Jenkins, town clerk.

CLACTON.—October 16th.—For making up a thoroughfare, for the urban district council.—Mr. D. J. Bees, surveyor.

STOKE-ON-TRENT.—October 16th.—For making up eleven private streets, for the corporation.—Borough Surveyor.

CHISWICK.—October 16th.—For making up Grantham-road, for the urban district council.—Mr. Ernest F. Collins, clerk.

LEWISHAM.—October 16th.—For making-up work with artificial stone, for the borough council.—Town Clerk.

CHELMSFORD.—October 17th.—For street works in two thoroughfares, for the corporation.—Mr. W. Smith, town clerk.

CROYDON.—October 17th.—For making up private streets, for the rural district council.—Mr. E. J. Gowen, clerk.

BLACKBURN.—October 17th.—For the supply of granite setts, for the corporation.—Mr. W. Stubbs, borough engineer.

CROYDON.—October 17th.—For laying 10,800 yds. of soft-wood paving, for the rural district council.—Mr. E. J. Gowan, clerk.

CHADDERTON.—October 17th.—For roads and street works, for the urban district council.—Mr. H. Hoyle, clerk.

PRESTON.—October 18th.—For making up several roads, for the corporation.—Borough Surveyor.

BIRSTALL.—October 18th.—For tar-paving work, for the urban district council.—Mr. T. H. Hailstone, surveyor.

BRITON FERRY.—October 19th.—For the supply of broken granite or basalt, for the urban district council.—Mr. Alex. Clarke, engineer and surveyor.

HUNSLET.—October 21st.—For making up work, for the rural district council.—Mr. W. B. Pinder, clerk.

BOOTLE.—October 22nd.—For paving and sewering, for the corporation.—Mr. J. H. Farmer, town clerk.

ROMFORD.—October 31st.—For the supply of Guernsey granite, for the urban district council.—Mr. J. Turvey, surveyor.

WANSTEAD.—November 7th.—For making up certain streets, for the urban district council.—Mr. Bruce Blewitt, clerk.

Sanitary.

STOKE-ON-TRENT.—October 14th.—For the supply of filter press and other incidentals, for the corporation.—Mr. E. B. Sharpley, town clerk.

BLEAN.—October 14th.—For emptying cesspools, for the rural district council.—Mr. J. E. Burch, clerk.

KIRKBY-IN-ASHFIELD.—October 15th.—For laying 4,378 yds. of iron and stoneware outfall sewers, with manholes and other works, for the urban district council.—Mr. E. Bertram Hibbert, clerk.

BLYTH.—October 15th.—For scavenging work, for the rural district council.—Mr. F. Hopkinson, surveyor, 66 Bridge-street, Worksop.

BINGLEY.—October 15th.—For the supply and erection of revolving sprinklers, and floor tiles, for the urban district council.—Mr. H. Bottomley, engineer and surveyor, Town Hall.

RUNCORN.—October 17th.—For providing and laying 1,400 lin. yds. of stoneware pipes and construction of manholes, for the rural district council.—Mr. Geo. F. Ashton, clerk.

BARNSTAPLE.—October 18th.—For drainage work, for the corporation.—Mr. E. Y. Saunders, borough surveyor.

MANCHESTER.—October 18th.—For carrying out sanitary alterations, for the corporation.—Chairman of Drainage Sub-Committee.

BOLTON-UPON-DEARNE.—October 21st.—For the construction of stoneware-pipe sewers and manholes, and erection of pumping station and filters, for the urban district council.—The Surveyor.

HAYES.—October 21st.—For the construction of percolating filters, sludge beds, and humus tank, and alterations at existing works, for the urban district council.—Mr. D. C. Fidler, engineer, Grange-road, Hayes.

MAIDSTONE.—October 22nd.—For the supply of disinfectants, for the corporation.—Mr. S. L. Monckton, town clerk.

CONGLETON.—October 24th.—For the construction of sewage purification works, for the rural district council.—Mr. H. Ferrand, clerk.

BEXHILL-ON-SEA.—October 26th.—For the construction of storm-water overflow sewers, enlargement of brick culvert, and extension of storage tanks, for the corporation.—Mr. G. Ball, borough surveyor.

BECKENHAM.—October 28th.—For laying a 12-in. diameter relief sewer, to include 9,001 ft. of 12-in. pipes and sixteen manholes, for the urban district council.—Mr. F. Stevens, clerk.

LICHFIELD.—October 31st.—For the construction of 7,828 yds. of 6-in., 9-in. and 12-in. diameter stoneware, cast-iron and steel pipe sewers, including 12-in. sewer in deep channel work, manholes, ventilating columns, tanks, bacterial filters and rotary distributors, for the rural district council.—Mr. Thomas Moseley, clerk.

Stores.

BRADFORD.—October 12th.—For the supply of stores, for the tramways department.—Mr. F. Stevens, town clerk.

Miscellaneous.

HOWDEN.—October 11th.—For the construction of a trial boring at South Newbold, for the rural district council.—Mr. Henry Green, solicitor and clerk.

BRISTOL.—October 14th.—For the supply of cement, drain pipes, and paints, for the corporation.—Mr. Lessel S. McKenzie, city engineer and surveyor.

ECCLES.—October 14th.—For the supply of a four-cylinder petrol-driven motor fire engine, for the corporation.—Mr. Edwin Parkes, town clerk.

HALIFAX.—October 15th.—For the supply of scavengers' brooms, for the corporation.—Mr. P. Saunders, town clerk.

BOOTLE.—October 16th.—For excavation and drainage in recreation ground, for the corporation.—Borough Engineer.

ATHY No 1.—October 16th.—For sinking wells and erection of pumps, for the rural district council.—Mr. M. E. Doyle, clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.

BIRKENHEAD.—Accepted for making up two roadways, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor:—
Seabank-road: W. H. Ratcliffe, Birkenhead £742
Marlborough-grove: W Bramwell, Birkenhead 142

CHELTENHAM.—For the construction of nine combined circular sewage tanks in three sets, and eight percolating filters 101ft. in diameter, with roads, drains, and conduits, for the corporation.—Mr. J. S. Pickering, borough engineer:—

	Complete Scheme.	Alternative Scheme.
Johnson Brothers, Gloucester	£21,194	£10,373
T. J. Mason, Stourbridge...	19,228	8,435
W. Cresswell, Cheltenham...	19,095	9,163
C. Chamberlain, Leicester	18,996	9,684
Pattinson & Sons, Limited, London ...	18,175	8,934
Currall, Lewis & Martin, Limited, Birmingham	18,127	9,095
Williams, Mark & Co., Cheltenham ...	17,552	8,487
W. Cunliffe & Sons, Limited, Birmingham	16,964	8,267
A. Hill & Co., Kidderminster	16,837	8,178
J. Riley, Cheltenham*	16,567	8,135
Tilt Brothers, Bromsgrove (withdrawn)	16,385	7,983

CHESTERTON.—Accepted for the construction of sewer, with manholes, for the rural district council:—
E. Bailey, Cambridge, £610.

LITTLEHAMPTON.—The following tenders have been accepted by the urban district council:—
Cleaning and repairing a sewer in South terrace (east-end).—G. E. Hayward, £73.
Paving, kerbing, and channelling in various parts of the town.—E. G. Holland, £462.
Horse shoes and shoeing.—H. Ide, £1 5s. per horse for six months.
Street-watering, carting flints and general carting.—H. Harris, 11d., 10d., and 10d. per hour respectively.

MOUNTMELLICK.—For extending water mains, sinking wells, and erection of a pump, for the rural district council:—
Cleaning the open drains in town of Mountmellick, in connection with the main drainage around the town.—M. Fitzpatrick, Mountmellick, £15; J. Aherne, Mountmellick, £15; P. Connolly, Mountmellick,* £15.
Extending the main waterpipes in connection with the Maryborough Waterworks, from Barrock-road to the houses in course of erection and known as "Kellyville," Maryborough. P. Kelly & Co., Maryborough,* £25.
Keeping the stench traps, grates, water-tables, channels, and laneways in town of Mountrath clean for one year.—W. J. Cooper, Mountrath, £7; W. Tynan, Mountrath,* £7.
The consideration of tenders for the sinking of wells and erection of pumps was adjourned to the next meeting of the district council.

TIPTON.—For the erection of sanitary conveniences, drainage, paving of playgrounds and other work at the Burnt Tree and Dudley Port council schools, for the Tipton Education Committee.—Mr. W. H. Jukes, surveyor:—

	Burnt Tree Schools.	Dudley Port Schools.
W. Cooper, Blackheath ..	£512	£325
Holland, Jnr., Dudley ...	422	247
G. Oakley & Son, Dudley	390	230
H. Golding & Son, Dudley	388	372
A. J. Crump, Dudley ...	385	223
H. Dorse, Hradley Heath	381	211
Jakeman & Round, Dudley	379	205
J. Sisman, Tipton... ...	370	214*
W. A. Hendrick, Tipton...	366*	207

Surveyor's estimate, £364 and £221.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

11 12.—Institution of Municipal Engineers: Annual General Meeting in London.
15.—Institution of Municipal Engineers: Eastern District Meeting at Godmanchester.
19.—Institution of Municipal Engineers: Joint Meeting of Northern and Yorkshire Districts at Harrogate.
19.—Institution of Municipal and County Engineers: North Wales District Meeting at Wrexham.
26.—Royal Sanitary Institute: Meeting at Alton; Discussions on "Housing Problems in County Areas" and "Municipal Work in Alton." Town Hall, 11.15 a.m.

SCHOLARSHIPS.

"WILLIAM LINDLEY BEQUEST" SCHOLARSHIP.

Applications are invited for this Scholarship, which is in the administration of the Committee of Management of the Benevolent Fund of the Institution of Civil Engineers, is tenable for three years, and is of the value of £40 per annum.

The main conditions are that the holder shall be the son of a Corporate Member or of an Associate of the Institution, between 16 and 20 years of age, who is desirous of entering the Civil Engineering profession, but whose means are inadequate to defray the incidental expenses. In the event of there being more than one suitable applicant, preference will be given to any candidate whose father's career has been devoted to the Sewerage and Water Supply of Towns, or whose inclination tends towards taking up that branch of the profession.

The Scholarship will be vacant on the 1st January, 1913, and applications should be addressed to the Honorary Secretaries of the Fund, 12 Dartmouth-street, S.W., not later than the 15th November next.

October 3, 1912.

PREPARATION FOR EXAMINATIONS.

ALGEBRA, Logarithms, Trigonometry, Graphs, Mensuration and Formulæ are some of the subjects included in our Standard Course of Engineering Mathematics, issued at a low inclusive fee, which may be paid by the easiest of instalments; 10 days' trial course, 1s.—Particulars and specimen lesson forwarded on application to the Correspondent School of Engineering Mathematics, Harley-road, Blackpool (late of Bilston).

(Continued on p. xxii.)

APPOINTMENTS OPEN.

WATH-UPON-DEARNE URBAN DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

Applications are invited for the appointment of Assistant in the Surveyor and Water Engineer's Department. Whole time to be devoted to the duties of the office. Commencing salary £85.

Candidates must have had experience in a Municipal Engineer's Office.

Applications, in candidate's own handwriting, accompanied by not more than three (copies of) testimonials, to be sent to Mr. J. H. Drew, Engineer and Surveyor, Town Hall, Wath-on-Dearne, not later than Tuesday, the 22nd of October, 1912, endorsed "Assistant."

NICHOLSON & CO.,
Clerks to the Council.

October 8, 1912.

ASSISTANT SURVEYOR OF ROADS required by the Gold Coast Government for the Public Works Department for two tours each of 12 months' residential service, with possible extension. Age between 25 and 40, preferably unmarried. Strict medical examination and vaccination if necessary.

Salary £300 a year, rising to £350 by annual increments of £10. Whilst actually performing the duties of the office in the Colony a commuted allowance of £7 10s. a month will be paid in lieu of travelling, lodging and all other allowances. Free first-class passage out and home again on satisfactory termination of engagement. Half salary on voyage out, full salary from date of arrival in the Colony.

Two months' leave on full pay after 12 months' tour, increased to 4 months if returning to the Office, with full pay during voyage or voyages and free passages.

Candidates should have received a good technical education, and have had experience similar to that obtained in a large Municipal Engineer's Office, or in the Office of an Engineer in good general practice.

They should have had experience in Road Surveying in a tropical country, or on Railway Surveying in this country, and be experienced in the design and construction of large Engineering Works, including concrete, preferably reinforced and steel construction, in the preparation of Plans, Specifications, Bills of Quantities and Estimates, and be proficient in the use of surveying instruments, including the Mining Dial.

They should also be well up in Building Construction.

Application by letter (no special form required), stating age, whether married or single, giving full particulars of experience, accompanied by copies of testimonials (not originals), with names and addresses of referees of whom inquiries can be made as to capabilities and character, should be sent as soon as possible to the Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W.

Quote M 5,497 on left-hand top corner of application.

MR. FRANK LATHAM, M.INST.C.E.I., F.S.E.

President of the Institution of Municipal Engineers, 1912-13.

The Surveyor

And Municipal and County Engineer.

Vol. XLII. OCTOBER 18, 1912. No. 1,083.

Minutes of Proceedings

The Institution of Municipal Engineers.

The preliminary proceedings at the fourth annual general meeting of the Institution of Municipal Engineers, which was held last Friday and Saturday, were of a very pleasant and cordial character. The inauguration of Mr. Frank Latham, M.INST.C.E.I., the borough engineer and surveyor of Penzance, as president was signalised by the presence of the mayor of that town, who paid an eloquent tribute to the characteristic energy and ability which Mr. Latham has displayed in his present office. In the course of a general reference to the special privilege which attaches to mayors of finding fault with municipal engineers, his Worship pointed out that the exercise of the function of criticism ought to be like parental chastisement, and that the tendency to groundless complaint from outside sources should be jealously watched. The mayor further fully acknowledged the important and arduous nature of the duties of the modern municipal engineer, and, in speaking of the scope which the profession affords to a man of ingenuity and resource, he gave as an illustration Mr. Latham's well-known experimental work in regard to the force of the waves at Penzance. A cordial vote of thanks very fittingly expressed the members' warm appreciation of his Worship's presence at the meeting. Another pleasing feature of the opening proceedings was the well-merited presentation made to Mr. B. Wyand, the indefatigable secretary of the institution, and his wife.

The council of the Institution submitted their report upon the work of the past year, from which it appears that the Institution continues to progress. There has been a slight increase in the number of members, and as regards finance, there was an excess of income over expenditure for the year, notwithstanding the fact that the balance-sheet shows that a large number of subscriptions are overdue. In the body of the report the various items of the year's work are shortly reviewed, and mention is made of the appointment of delegates to the forthcoming International Road Congress, and to the Sectional Committee on the Standardisation of Road Materials which has been appointed by the Engineering Standards Committee. The mover and seconder of the adoption of the report concurred in complimenting the Finance Committee upon the manner in which they had carried out their duties and watched over the interests of the Institution. There can be no doubt that the position which the Institution has attained is due to their efforts, and to those of the officers who have served so well.

In another column will be found a verbatim report of the presidential address of Mr. Frank Latham, who put forward some most excellent suggestions for elevating the general status of the municipal engineer. Mr. Latham has considerable command of epigram, and some of his pointed sentences will be remembered for a long time by those who heard his address. For example, "the municipal engineer of to-day is the expert of less than a quarter of a century ago" is a sentence which sums up the generally recognised fact that works which would have necessitated the knowledge and experience of the specialist a quarter of a century ago are undertaken by the municipal engineer of to-day as a duty. This observation applies with almost equal force to both architectural and engineering work, and Mr. Latham did well to point out that the interests of the municipal engineer require watching in this respect, for the profession is so intimately associated with architecture, as well as with civil engineering, that no legal rights of status or protection should be granted to either one profession or the other without the rights of the municipal engineer being recognised on both sides. Dealing more directly with the affairs of the Institution of Municipal Engineers, the new president expressed his gratification at the variety and originality of the papers which have been read. "A paper which is a compilation, however much industry is spent about it, cannot be compared to that—however short it may be—which is prepared from the special knowledge of its author." This is a view with which we entirely agree. At the same time, however, we do not wish to underestimate the practical value of the more plodding kind of paper, and we fully realise that it is not given to all engineers to have the time or inclination to write papers which shall be worth reading on subjects requiring original treatment or research work in their preparation. Another of Mr. Latham's aphorisms was: "No man takes an advance step without criticism, and the more advanced such step may be the more severe will be the criticism." The man who contributes a new idea to the sum of professional knowledge in his paper, and thereby provokes criticism, may certainly congratulate himself upon having said something worthy of notice. We hope that Mr. Latham's remarks on the reading of papers will receive the attention and consideration which they undoubtedly deserve.

* * *

True Co-operation: the Penzance Policy.

An incident of the Institution of Municipal Engineers' meeting which we think worthy of special mention was the presentation made, during the progress of the "social evening" at the Holborn Restaurant, to the Mayoress of Penzance, and her most graceful acknowledgment of it in a little impromptu speech which was as admirably phrased as it was obviously heartfelt. It was the culminating incident which fittingly emphasised the happy relations between the mayor personally and as representing the Penzance Town Council and the engineering expert who so ably and loyally serves that body. It was further pleasing evidence of the kindly feeling shown by the mayor's long journey to be present at the congress in London and his close interest in all the proceedings of the day. We are glad of the opportunity to

express the hope that such true co-operation, such unity of purpose between administrators and their professional advisers, may become more general throughout the country than, unfortunately, it is at present. Mayors, councillors and engineers are, in their several capacities, working for the common weal; their work would be doubly effective if they were always in such perfect accord as are Mr. Frank Latham and the elected representatives of the ancient Cornish stannary town. How different from the experience illustrated in the farewell letter of an ex-town clerk quoted in Mr. Winter Gray's shrewdly practical paper on "Superannuation and Security of Tenure":—"So long as party strife continues in our business affairs it is hopeless to get the best results [says the writer]. The yearly recriminations of October are full of prejudice to the welfare of the city. The strife for party votes affects the work of the municipality all the year round. It makes the position of officials still more difficult than their actual duties would do. When men see their efforts handicapped it makes them despair. . . . The anxieties of official life, the constant strain, the feeling that a well-earned income is grudged by many of those who think they pay it, make the position of an official difficult indeed. . . ." Compare the conditions here indicated with the policy of Penzance, and who can question which is the better for the interests of the ratepayers?

* * *

Motor Omnibus Problems.

While the great development of motor omnibus traffic, more particularly in London and its suburbs, has given rise to serious problems which demand the close attention of engineers and accountants who are concerned in the matter of the transport of passengers in public vehicles, the difficulties which have to be met seem to fall within limits which nowhere close in so as to destroy the usefulness or to make impossible the economical management of this method of transport. Taking first the element of danger; it is difficult to believe that strict speed regulation and a somewhat low limit to the number of passengers carried in each vehicle would reduce the earnings of the motor omnibus below paying point, while both restrictions would reduce the rate of wear and tear of the roads and streets. The present state of affairs in this respect is no sure guide to the economic position, since it is brought about, not only by the competition with other modes of transport, but also by that between one "line" of omnibus and another. If a single vehicle, designed with a greater regard to the safety of passengers and the public than is now usual, and run at a slower speed, were to "cut in" as a competitor with other omnibuses, it might fail to pay; but it would not follow that omnibuses generally could not be run at a profit if they were all subject to similar restrictions. Somewhat higher fares and slower speeds might reduce the rate of the increase in numbers of omnibuses, but would hardly do more than that.

With respect to the punishment inflicted on road crusts and street pavements, it is safe to say that this could be reduced considerably by greater attention to certain details of construction of the vehicles as well as by a recognition of the necessity for designing the pavements of omnibus routes with features embodied specially to meet the effects of the dominant vehicle using the road. The modern form of granite block paving adopted in Holborn and the increase in the thickness of concrete foundations for wood paving in Hackney are examples of what is being done in this direction. Such thickening of the concrete crusts should go far to reduce the wear and tear of the carpet layers of asphalt or wood blocks, the difference between motor omnibus traffic and ordinary motor traffic being mainly a matter of wheel loads. The idea which was at one time held in some quarters, that the wear of the rubber tyres of motor omnibuses corresponded financially to the provision of rails for tramcars has proved to be fallacious, but it has been found, on the other hand, that the omnibus can bear the burden of the petrol tax, while a reduction of working expenses may yet be attained by the use of petroleum. This is to be avoided if possible, however, on account of the smell, which would be more difficult to keep under than is that of petrol. That some £65,000 a year is paid by the London General Omnibus Company towards the cost of road improvement in the British Isles is a fact of much significance, but it leads us to the conclusion that such moneys should be available, not only, as at present, for road improvement, but also for road maintenance. It is, in fact, abundantly clear that the time has now come when the Road Board should be empowered to use its funds either for maintenance or for improvement, each case being decided on its merits. It is probable that if the powers of the board were so extended further sources of revenue would be allotted for road purposes. We are unable to agree with the proposition put forward at a recent meeting of the Association of Municipal Corporations that the petrol tax proceeds should be allotted automatically to the highway authority "on whose roads the vehicles run;" to do so would be to revert in principle to the old toll-gate system, which, in spite of valuable features, must definitely be regarded as a thing of the past in these islands. At the same time, we hold the opinion, as expressed in these columns a few weeks ago, that the Road Board should be granted the powers necessary to enable it to deal adequately with the case of local authorities which have to maintain omnibus routes, especially since in these and similar cases the letter of the Act is at variance with its spirit.

As regards the methods to be adopted in the construction of road crusts and street pavements intended to withstand heavy omnibus traffic, it is important that specialisation shall be avoided, and there must be nothing corresponding to the rails of a tramway, in any shape or form. At the same time, in the development of the methods employed, the importance of the dominating element of traffic must not be overlooked. The matter is receiving attention from the responsible executive officials, and we have no doubt that important economies will be effected, relatively to the amount of traffic carried.

* * *

The Intercepting Trap.

Among the papers read at the annual general meeting of the Institution of Municipal Engineers last week, one of the most interesting was that by Mr. H. C. H. Shenton, dealing with the Local Government Board report upon the intercepting trap. We print the paper itself this week, and the discussion will appear in our next issue. The author raised certain points for discussion, but did not give any extended review of the report, and expressed the hope that the discussion would be taken up by members of the municipal engineering profession, and that they would, in particular, devote their remarks to consideration of the manner in which to act when it is finally established that intercepting traps are to be omitted on house drains. Although the discussion which followed the paper was excellent in its way, it did not follow to any great extent the lines suggested by the author, nor did many of the engineers actually holding office at the present moment contribute their observations. Most of the remarks were devoted to criticism of details of the report, and of the conclusions of the Local Government Board Committee, and may be summed up in the statement that the intercepting trap was introduced for the purpose of dealing with conditions which do not now exist, and may therefore have to be modified. It is quite certain that there is bound to be considerable difference of opinion among practical men with regard to the questions

dealt with in the report, but the committee obtained a large amount of valuable evidence from a number of witnesses possessing experience and knowledge of the subject, and if meetings arranged to discuss the report simply result in the bringing forward of the usual *pros* and *cons* of the subject, they will do no more than repeat the evidence already laid before the committee, and very little progress will be made. In view of the fact that the Royal Sanitary Institute have arranged a meeting to discuss the subject—and other institutions will doubtless follow suit—we would like to suggest that Mr. Shenton's recommendation should be adopted, and that the discussion should be confined to consideration of the means by which the conclusions of the report can be most suitably put into effect.

For our own part we should say that there will be a sort of transition period during which the intercepting trap will be omitted on many new house drains, but very little will be done to abolish existing traps. On the other hand, much immediate good will probably result from the report in greater care devoted to the construction of house drains, and particularly in the more general adoption of cast-iron drains. This alone will help to improve matters considerably, and if to this be added greater attention to flushing and cleaning, by the time the intercepting trap is becoming a thing of the past the condition of drains and sewers will have improved to such an extent that those who now insist upon the necessity for the intercepting trap will recognise that their arguments in its favour have lost their force. Those who study the report thoroughly will see that the omission of the intercepting trap is not a new departure, and that in a number of towns its omission has not caused any excessive increase in the death-rate, and when this is taken into consideration, in conjunction with the results of the investigations made by the Local Government Board Committee, it will, we believe, be admitted that nothing but good can result from the putting into effect of the whole of the recommendations contained in the report.

The contention that it is necessary for engineers to continue the long discussion, which has already occupied several years, as to whether intercepting traps should be abolished or retained, is, we consider, inadmissible. In order to come to a decision upon this important point, the Local Government Board have obtained an enormous mass of evidence from those best qualified by their knowledge to express an opinion. They have also made independent observations, and it is impossible to gainsay the evidence produced. It is not to be supposed that the Local Government Board issue a report of this kind in any doubting spirit, and it must surely represent the basis of a settled policy on the part of the board in the future. It therefore becomes the duty of municipal engineers to support the board, whatever their private opinions may be, and the only useful manner in which they can discuss the report is to consider how its teachings can be best applied, for, although the intercepting trap may be unnecessary, it is obviously very difficult to start working on new lines.

* * *

Modernising Building By-Laws. The substitution of a modern code for the Model Code of by-laws relating to new streets and buildings was the theme of Mr. F. W. Platt's paper read at the annual meeting of the Institution of Municipal Engineers. His observations were based upon the recent circular-letter of the Local Government Board to local authorities directing attention to the need of reviewing the existing codes of by-laws in operation in the various local governing centres of England and Wales. It is a great step in advance that the board have at last surmounted their very natural reluctance to modify or revise their code, upon which great care and thought had been expended. It must be recognised, however, that by-laws which were applicable to the conditions which obtained in 1877 are entirely unsuited to the totally different conditions of 1912. Modes of construction have changed and scientific knowledge has made rapid advances; and the demand of those who are engaged in constructional work that they shall be permitted to profit by the economies which modern improvements have rendered possible cannot be logically resisted. As Mr. Platt pointed out, the authors of the Model Code in drafting the earlier forms of by-laws had regard mainly to buildings of stone or brick construction, and apart from what is considered their respective character they are inappropriate to types of construction now in use, such as buildings of hollow blocks or slabs of terra-cotta, concrete, reinforced brickwork, and so forth; for hollow or half-timbered walls, and steel or other framed walls hung with tiles and slates, filled in where necessary with incombustible materials; for buildings where piers are employed, and where large window openings are needed; or for the thickness of walls of outbuildings. Moreover, the ordinary clauses for the laying out of roads do not permit of the class of roads which have been designed in some garden cities, neither do they differentiate between the type of paving needed for varying grades of roads or for exceptional arrangements which are demanded in certain cases by the configuration of the ground.

In considering the character of the changes that are required, it may be said at once that any new by-laws must be free from the defects of rigidity and applicability only to stereotyped forms of construction. Mr. Platt suggests that the new regulations must take into consideration the type and purpose of any proposed buildings, and the maximum stresses which are permissible in the materials to be used. We quite agree that so far as practicable matters of modern construction should be treated on these broad lines, rather than by the enforcement of tabulated sizes and thicknesses. Mr. Platt's paper, which is reproduced elsewhere in this issue, contained many valuable suggestions as to the revision of the by-laws in regard to ordinary types of building, but we must refer our readers for details of these to the contribution itself.

* * *

Superannuation. If any apology be needed for returning to this subject, it is amply afforded by the obvious importance of pertinacity in its advocacy and the need for keeping alive a vigorous public opinion in its support. At the recent annual meeting of the Institution of Municipal Engineers, Mr. A. Winter Gray recalled that one of the objects of the Institution is "to take such steps as may be deemed expedient with a view to obtaining security of tenure and superannuation for municipal engineering officials." It must be patent to everybody that in the matter of superannuation the case of the municipal engineer cannot be considered apart from that of other local government officers. This fact leads inevitably to the further conclusion that it is a duty incumbent upon municipal engineers and their staffs to join the National Association of Local Government Officers, which is the only organisation at the present time that appears at all capable of bringing the matter to a successful conclusion. Mr. Gray further advocates that the Institution before whom he read his paper should undertake propaganda work in the various districts. This is a matter for consideration; but we are convinced that the right policy is to keep the question of superannuation and the justice of the claim for it constantly before those who are concerned, whether as officers or members of local authorities, so that at all events there can be no mistake as to the keenness and unanimity of officers in their demand.

Institution of Municipal Engineers.

FOURTH ANNUAL GENERAL MEETING IN LONDON.

The annual general meeting of this institution was held on Friday and Saturday last, October 11th and 12th, in the Council Chamber, Southampton-row, London, W.C. The chair was taken in the first instance by Mr. E. A. Stickland, Assoc.M.Inst.C.E., borough surveyor of Windsor (the retiring president). The attendance included Messrs. Frank Latham (president of the institution), E. A. Stickland and A. E. Prescott (past-presidents), Henry C. Adams and Horace Boot (vice-presidents), T. Mundy (hon. treasurer), F. A. Bailey (Leek), A. R. Bleazard (Clitheroe), W. Louis Carr (Ruislip-Northwood), Horace Cubitt (London), A. J. Elson (Penge), F. E. Ennals (Billericay), William Finch (Cumberland), Thomas Knight (London), J. Lewis (Yiewsley), E. Madin (Irthlingborough), A. W. Nye (Shoreham), Arthur Palmer (Greenwich), F. W. Platt (Salford), L. Randerson

The Mayor of Penzance
(Councillor Howell Mabbott, J.P.).

(Meopham), Ernest E. Ryder (Bushey), H. C. H. Shenton (London), W. H. Scott (Ruislip-Northwood), H. Shepard (London), Ernest W. Veale (Farnham), E. Whitwell (Abersychan), Egbert G. Woodward (London) and B. Wyand (secretary of the institution). Among the visitors were Messrs. Howell Mabbott, J.P. (Mayor of Penzance), H. Percy Boulnois (London), E. R. Capon (Epsom), W. C. Easdale (London), H. J. King (Ruislip-Northwood), Baldwin Latham (London), A. J. Martin (London), R. V. Spencer Phillips (London), C. Chambers Smith (London) and H. D. Searles-Wood (London). The attendance in the evening was swelled considerably, some hundred and twenty members and friends being present.

WELCOME TO THE MAYOR OF PENZANCE.

The Chairman said he wished to present to the members his Worship the Mayor of Penzance (Mr. Howell Mabbott, J.P.). They were, he felt sure, highly honoured and very much gratified that the mayor of a far-distant town in the extremity of England should pay them the compliment of coming to the centre of the universe to attend their meeting. Mr. Mabbott had left a beautiful climate and a town free to the winds of heaven to come and be suffocated by a London fog, and he tendered that gentleman his sincerest thanks for his presence. The institution had chosen as their president for the ensuing year the surveyor of the town (Mr. Frank Latham) of which Mr. Mabbott was mayor, and he (Mr. Stickland) was quite sure that in doing so they had made a very good selection. The institution had now been in existence for four years, and it could claim that it was equal to any other and second to none. As municipal surveyors they were all trying to do their best for the community at large, and in pursuit of this object they received more kicks than half-pence; but so long as it was their duty to be thus circumstanced this was the greatest reward they could expect. He proposed a vote of thanks to the Mayor of Penzance for his presence at their meeting.

The Mayor of Penzance, who was received with applause, said he could quite agree with the remark their president made to him in the adjoining room, that mayors had a particular delight in finding fault with municipal engineers. He (the mayor) replied that that was a little pleasure and luxury quite their own, but that, as was the case with parental love, while they indulged in it themselves, they objected to other people doing it. He had, as the chairman had stated, come from a land of sunshine, and when he arrived in London one of the first things that suggested itself to him was that their institution should take steps to prepare some plan or specification to prevent the recurrence of fogs. When he made the suggestion to the president that gentleman replied that the matter required previous notice, and he (the mayor) thought he was doubtless right. When this institution selected his friend Mr. Frank Latham—and he was delighted to own him as a personal and dear friend—as their president they paid a compliment to the town of Penzance no less than to Mr. Latham, and immediately he knew he was their president-elect he felt it would be a privilege to be associated with their proceedings that day, and consequently he determined to come. Mr. Latham could not ask them to go west, though they might have gone further and fared worse, and as London was the only place that could take the place of Penzance—(laughter)—they were delighted to meet each other in the metropolis. Time had indeed worked wonders with them at Penzance, and their borough engineer had done his level best to efface some of the signs so often associated with a remote western town, and bring them into line with normal and sensible people. Mr. Frank Latham was, if he might say so, a confirmed bigamist, for years before he was wedded to a most estimable lady he had given himself absolutely, body and soul, to municipal engineering. He (the speaker) had a very great sense of appreciation of the duty of municipal engineers to the world, for the comfort, health, happiness and well-being of the nation practically depended upon their exertions and skill. The day of the village smith or carpenter becoming the municipal engineer and surveyor was past, and the day had come when municipal engineering would demand from them every particle of brain and thought they could bring to bear upon it. Although Penzance had just been discovered, the town had great scope for the services of a skilled engineer. Mr. Latham came to them many years ago. He found them evolving—how they would have evolved without him heaven only knew. He found a great sea front open to the wide Atlantic, and those of them who had any idea of the sea in its worst moods would have some notion of what he had to do. Could they conceive a sane man leaving his warm bed on a dark, stormy night, and, clothed in a sou'wester, hanging over a pier with some instrument of his own invention to discover the force of the waves coming from the Atlantic? Mr. Latham had again and again donned the dress of a diver and gone, like St. Paul, to the depths of the sea, and he had by his knowledge and skill devised roads that would not only stand the test of wear and tear, but he had invented methods to prevent dust being carried about in clouds, and this alone was a great boon to the people of Penzance. Then he had also had to deal with the question of extraordinary traffic. These and other problems Mr. Latham had solved for them. To know him was to love him. Ever courteous and affable, he had won the respect and esteem of his council, and though they did not expect to keep him at Penzance, they hoped the day was far distant when they would lose him. He had the greatest pleasure in bearing any little testimony he was able to bear to the worth

of the gentleman they would that day elect as their president. He should like to say that although Penzance was so very far from the metropolis there were possibilities for the development of engineering skill in the neighbourhood that could not be found in many other towns. It was an ancient town being transformed into a modern town, and Mr. Latham had exercised considerable skill in avoiding any act of vandalism when changes were to be made. They loved their narrow roads and their old buildings, but at the same time they wanted something that would be up-to-date. Mr. Latham was solving that problem by giving them not only comfort in their roads, but a supply of pure, clear, cool and delicious water. For boundless enthusiasm he did not think they had anyone in their institution who would surpass him, and if great interest in the affairs of the institution were useful to it then he was quite sure their choice that day would be a very bright one.

Mr. Frank Latham seconded the vote of thanks to the Mayor of Penzance for his presence. He was sure they all appreciated the effort that the mayor and mayoress had made to come such a distance in order to prove their interest in the fact that he (the speaker), the borough engineer and surveyor of Penzance, had been nominated and was about to be elected to the presidential chair of the institution. As for what had been said about himself, he confessed it might have made him slightly vain if he thought it was true. He knew Mr. Mabbott was a most truthful man (laughter)—but he (the speaker) certainly never thought he had done so much as had been suggested by that gentleman. What he had done had been done in the interests of the profession, but it appeared from the full-heartedness with which the Mayor of Penzance had spoken that he had been doing something to interest that gentleman as well as others. He could only thank him most sincerely for the manner in which he had spoken. A word or two of that kind helped to spur one on to further interest in good work. When the municipal engineer took up something new he was impelled to remember that such work cost money as well as energy, and sometimes one came off worst, especially when he was battling with the sea. It was doubtful at one time whether he should be able to take the presidency of the institution, but he had recovered from an accident that happened to him. He was sure they would agree that every official should act as much as possible in the interests of his work and the betterment of his town, and assist its progress in every possible way, even if he did have to incur risks in stepping a little beyond the margin of his ordinary duties. He thanked his Worship the Mayor for the manner in which he had spoken of him, though he was constrained to say that he only felt he had carried out his duty. If he had not done what the mayor had stated he had done he should have felt he had not altogether accomplished what he ought to have done.

PRESENTATION TO MR. AND MRS. WYAND.

The Mayor, having acknowledged the vote of thanks, proceeded to make a presentation to Mr. B. Wyand, secretary of the institution, and Mrs. Wyand, on behalf of the subscribers. Mr. Wyand, his Worship stated, had been indefatigable in his efforts in starting the institution, and his work had been eminently successful. The members recognised that while the man was the head he was not always the neck, and that the neck sometimes regulated the movements of the head. The wife took the place of the neck and he understood that Mrs. Wyand, in a spirit of genuine self-sacrifice, had rendered considerable assistance to her husband in carrying out the work of the institution. He had the honour, on behalf of the members, to ask Mr. Wyand to accept some little token of voluntary appreciation, and to express the pleasure and interest they felt in recognising the joint labours of Mr. Wyand and his wife on behalf of the institution. The members were deeply grateful for the patience Mrs. Wyand had exercised in rendering constant assistance in the office, and thus enabling Mr. Wyand to go out of doors in pursuit of his secretarial duties. His Worship concluded, amid applause, by handing a cheque to Mr. Wyand.

Mr. Wyand, who was warmly received, accepted the presentation with thanks on behalf of himself and his wife. He could not say it was quite unexpected, as he had an impression lately that "something was on." At the last council meeting, for example, he was turned out of the room. He thought it might be an increase of salary, or, perhaps, the sack, but it was not that (laughter). He had had always two fears of what might perchance happen to him. The first was that he would be the recipient of a marble clock which would not go and was too big for the mantel. That had not come off. The second fear was that he might become a millionaire, which would never come off. (Laughter.) He gratefully acknowledged the valuable assistance he had received from his wife, and once more returned thanks for the kind gift from the members, and the words to which the Mayor of Penzance had given utterance.

ANNUAL REPORT OF THE COUNCIL.

The annual report of council and balance sheet were next presented:—

ANNUAL REPORT AND BALANCE SHEET.

The council beg to report as follows:—

ROLL OF THE INSTITUTION.

At June 30, 1911, the roll of the institution was 860, consisting of 697 members, 65 associate members and 98 students. At June 30, 1912, the roll was 882, consisting of 712 members, 94 associate members and 76 students. During the year 28 members, 24 associate members and 2 students were elected, and 5 associate members were transferred to membership and 10 students to associate membership. The losses resulting from death, resignation and erasure by change of appointment and other causes amount to 18 members and 14 students.

FINANCES.

The accounts of the institution have been audited, as on the last occasion, by Messrs. Leake & Co., chartered accountants, and the balance sheet and income and expenditure account are herewith presented. The council are pleased to be able to show again an excess of income over expenditure on the year's working amounting in this instance to £47 8s. 5d., and making an accumulated balance of £234 7s. 9d., notwithstanding that during the year £50 has been laid aside as a provision against "irrecoverables."

MEETINGS.

Six general meetings, eleven council meetings, and twenty-three district meetings were held during the financial year. There were also ten meetings of the Finance Committee, one of the Examination Board, and two of the Special Purposes Committee. The general meetings were held at Windsor, London (3), Manchester and Hendon; the district meetings at Nottingham, Manchester (2), London (6), Worcester, Fontburn, Yarmouth, Edinburgh, Lewes and Seaford, Leeds, Brentwood, Newcastle (3), Birmingham, Heywood, Sunderland and Cinderford. All the other meetings were held in London. The attendance at Hendon was the record one of 358, while the number would have been largely augmented had it not been for the inclement weather. This meeting is notable, too, as the first held jointly by municipal engineers and aviators.

DISTRICT COMMITTEES.

At the meeting held at Edinburgh on July 29th a Scottish district was formed, and the number of districts fully constituted is now ten. The meetings have, as a general rule, been well attended and thoroughly appreciated by local members, and the palm for numbers again goes to the Northern and North-Western districts, where excellent organisations are maintained, and where considerable enthusiasm is displayed. Practical experience in the working of the district committees has shown certain amendments to be desirable, and several alterations in boundaries are under consideration. It is possible that within the next few weeks the north and south portions of Wales will be affiliated to the Western and North-Western districts respectively, while the Yorkshire district will become absorbed by the Northern and North-Western districts.

EXAMINATIONS.

The first examination of the institution was held in London on November 2nd, 3rd and 4th. The examiners were Messrs. Henry C. Adams, J. Rush Dixon and J. E. Edgcome and Capt. H. Riall Sankey, with Prof. Henry Adams as senior attending examiner. Candidates were examined in sixteen papers, with the result that one candidate was awarded the full Diploma in Municipal Engineering, one was certificated in Electrical and Mechanical Engineering as applied to Municipal Work, one satisfied the examiners in Building and Structural Engineering as applied to Municipal Work, and two satisfied the examiners in the General Paper. The candidate obtaining the diploma, Mr. A. Douglas Barron, obtained special mention for

excellence of work. It was considered better that future examinations should be held in the month of May, and arrangements were made for holding one in May next, but, owing to the dislocation of business and traffic by the coal strike at the time, it was postponed.

SPECIAL PURPOSES COMMITTEE.

A Special Purposes Committee, to which matters of importance can be referred for preliminary investigation and subsequent report to the council, was formed in February, and held two meetings up to the end of the financial year.

LIST OF MEMBERS.

It was decided to prepare a new list of members, with names arranged both alphabetically and topographically, to be issued immediately after the annual meeting and the election of the council for 1912-13.

INTERNATIONAL ROAD CONGRESS, 1913.

In response to the request of the General Organising Council of the International Road Congress, 1913, collecting a mass of valuable information as to the loads for which it is desirable to provide in the design of highway bridges, and it is hoped that a report on the subject will be issued shortly.

EXHIBITION OF NON-FERROUS METALS.

Mr. Henry J. Farmer was appointed to represent the institution on the council of the International Exhibition of Non-Ferrous Metals, which was held in London.

BENEVOLENT FUND.

A fund was organised in July on behalf of a member in straitened circumstances, and it is satisfactory to note that the assistance rendered helped to tide him over a time of ill health and unemployment—until, in fact, he had regained his health and had obtained a temporary post.

NATIONAL INSURANCE ACT, 1911.

The National Association of Local Government Officers became an approved society under the National Insurance Act, 1911, and many members of the

20 Abchurch Lane, London, E.C.
September 27, 1912.

LEAKE & Co. (Chartered Accountants), Auditors.

the following members were nominated to represent the institution at the congress to be held in London in 1913: Messrs. Henry J. Farmer, A. E. Prescott and E. A. Stickland. The president of the institution has been added to the list of honorary vice-presidents of the congress.

ENGINEERING STANDARDS COMMITTEE.

The Engineering Standards Committee convened in May a conference on the Standardisation of Road Material, and Mr. A. E. Prescott was nominated to represent the institution at the conference. Certain questions having been raised a Sectional Committee, of which Mr. Prescott is a member, has now been formed to deal with the subject.

LOADS ON HIGHWAY BRIDGES.

The Joint Committee of the Concrete Institute and the members of the Municipal Engineering Committee, to which the institution has sent three delegates, are

institution have availed themselves of the opportunity to join a society which is composed of local government officers alone.

SUPERANNUATION AND SECURITY OF TENURE.

The National Association of Local Government Officers has been active in many other directions, and in none more so than in the movement for securing superannuation and security of tenure for all local government officers. The council of the institution have been working whole-heartedly and unceasingly in the same direction, and realise that only by the co-operation of all bodies having the interest of the municipal engineering profession at heart can success be obtained. The first serious attempt to obtain these concessions for municipal engineers has been made by the institution, and a notable contribution to the campaign was the paper read by one of the members of the council at a general meeting of the institu-

tion held in London in February. The council hope ere long to be able to report considerable progress.

PREMIUMS FOR PAPERS.

The premiums for the year 1911-12 for papers read before meetings of the institution have been awarded as follows: President's premium (presented by Mr. E. A. Stickland)—Mr. A. Winter Gray, for his paper "Superannuation and Security of Tenure: The N.A.L.G.O. and its Bill"; Institution premium Mr. Horace Boot, for his paper "The Electric Trolley Omnibus System and Railless Traction."

LIBRARY.

Further additions have been made to the library during the past year, and a valuable collection of up-to-date books has been got together. The arrangements made for borrowing for extended periods and other facilities have rendered the library extremely useful to those studying the various branches of their profession for examination and other purposes.

PROVINCIAL COUNCIL MEETINGS.

The suggestion has been made that a certain number of the council meetings in each year might advantageously be held in the provinces, and the council would be glad to have the opinions of members on the proposal.

Mr. Frank Latham moved the adoption of the report, and in doing so stated that every item contained in it had been carefully gone through. He could personally assure the members that everything connected with the institution was in a very satisfactory state. They had met the working expenses, and had a balance at the end of the year. They had paid for their library, and further had allowed for £50 which they might not collect. This latter was really an asset, but they did not reckon it as one, in case they did not receive the subscriptions. The state of things which the report revealed was highly satisfactory on the whole, and he thought the Finance Committee were to be complimented upon the manner in which they had carried out their duties and watched the interests of the institution. He might say that the committee had regularly informed him, as hon. treasurer, as to how things stood, and he could testify, therefore, that the work had been satisfactorily carried out.

Mr. Mundy, in seconding the proposition, said he quite agreed that something was due to the Finance Committee for the satisfactory position of the institution. On looking through the report he was reminded of the many activities in which the institution was engaged, and one's mind was insensibly carried back to four years ago, and to the many opinions then expressed as to whether the institution was needed or not. He thought those who stated at that time that they would be an institution of mushroom growth had found out their error, for now the institution stood in a very sound condition indeed. The institution consisted of the younger members of the profession who had much vigour in everything they did. From what they had heard that day they would learn that the institution was progressing, and there did not seem to be any doubt that it would make a mark in the municipal engineering world. At any rate, it had taken a rightful place among the institutions of the country, and there was no fear of the future, for they intended to go on working all over the country, and endeavour to do good not only to the members alone, but also to the profession in general. The institution was really a child in a way, but, being full of vigour, they trusted that it would reach to a stage of great strength.

The adoption of the report was then agreed to.

The Chairman said it was with very great pleasure he had to announce that Mr. Frank Latham had been elected president of the institution for the ensuing year. They had heard already from the Mayor of Penzance such an eloquent tribute to his character that it would be absolutely ridiculous for him (Mr. Stickland) to attempt to say anything in Mr. Latham's favour. If that gentleman fulfilled and carried out the high ideals the Mayor of Penzance described Mr. Latham as possessing, the institution would be highly honoured in having such a president. On behalf of the members, he wished him a most successful and pleasant year of office, and he would add that if there was anything he could personally do to assist Mr. Latham he would be only too pleased to respond to his call at any time.

Mr. Frank Latham then took the chair vacated by Mr. Stickland, and was greeted with applause. He remarked that it was one of the most pleasurable moments of his life to feel that he occupied the chair of that institution. He thanked the members for the honour they had conferred upon him, and he particularly thanked the members who during the past three or four years assisted him in carrying out the duties of hon. treasurer. He was grateful for the opportunity of being able to assist in the work, and for being allowed to have his own way, or, rather, he should say, a little scope, as he was placed such a long way from the Metropolis. He trusted that during his year of office the institution would continue to have the same success it had enjoyed in the past. From the start when Mr. Pegge was president, to be succeeded by Mr. Prescott and Mr. Stickland, it had gone on, so to speak, by leaps and bounds, more so probably than any member ever anticipated. They had succeeded in placing the institution upon a firm foundation, and it only remained for the members to make known the usefulness of membership in order to vastly increase the influence of the institution.

The President next proceeded to deliver his presidential address in the following terms:—

PRESIDENTIAL ADDRESS.

It is with a sincere sense of appreciation that I thank the members of the Institution of Municipal Engineers for electing me to the honourable position of president for the ensuing twelve months. I fully realise the responsibility of the duties of this high position, which have been so ably performed by successive and highly esteemed presidents in the past, and I have no doubt that in being entrusted with the office I shall receive the cordial support and assistance of all the members, and that thereby the reputation and welfare of the institution will be preserved, while the best interests of its members will be promoted by me with all the zeal and assiduity which lie within my power to exercise. I, however, feel that my responsibilities will be heavy, and therefore ask your kind indulgence for shortcomings on my part while I occupy the position as official head of this institution, and may it be said, on the completion of my year, that, while governing from the West, I never allowed the sun to set on its best interests and welfare.

Perhaps it is my duty to refer to that side of the institution to which I have had the honour of holding the key ever since its promotion—I refer to its financial status. My regard for the institution and its objects have prompted me to a discharge of this responsible office of treasurer from a time when there was no necessity for a key for locking up its reserves. All this may long be forgotten, but I still owe a deep debt of gratitude to our secretary, Mr. Wyand, for his thoughtful management during those early days, and likewise to the Finance Committee which was necessarily formed when the finances became an important asset. So successful has this side of the institution become that we have been able to meet all expenses in the provision of a splendid suite of offices and boardroom in Westminster—equipped with an expensive and much-appreciated technical lending library—and in the regular publication of the institution *Journal*. All working expenses, together with the necessarily heavy expenses in connection with the holding of meetings in all parts of the country, have also been met.

The institution may be considered to be a well organised society in which every member shares the full privileges of the main body, while he is also one of a separate district, presided over by a member elected annually and resident in that district. The affairs of each district are conducted by an elected local district secretary and District Committee, who in turn are responsible to the main governing authority.

The country was judiciously divided into districts during the presidency of Mr. Pegge, the city engineer of Durham, by whose wholehearted interest the areas were so completely thought out, at that time, that scarcely any deviation has since been found advisable. It is with pride that I am able to say that the resources are sound, and this is the result of a conscientious committee, who have well assured themselves of the assets before incurring liabilities. In the nomination of Mr. Mundy to succeed me as your treasurer the council have made a wise choice. Mr. Mundy has been chairman of the Finance Committee, and he is thoroughly acquainted with the finances of the institution, and he will, I feel confident, continue his interest in this sphere to the entire approbation of the members.

As this institution has had a good share of technical writings from my pen, it has been suggested as a

diversion that I might on this occasion address the members on the conclusions I have arrived at with regard to elevating the general status of the municipal engineer. It is true that this subject has occupied my mind for many years, and I have held strong views thereon, which have only been strengthened by experience and observation during the time which has lapsed since the establishment of this institution.

Naturally, any views expressed on such a controversial subject may to some minds only be exposing one's own incapacity. On such a question one has to contend with various opinions, which, however opposite, may, nevertheless, be held with equal sincerity. But perhaps the most difficult obstacle to overcome with any argument is the prejudiced mind, which is content in these days of reformation, enlightenment, and social intercourse to hark back to the good old days of stereotype curriculum for every one alike, irrespective of temperament and abilities. That will not do to-day. Everything is progress, and stereotyped forms and hard-and-fast lines are dry provender for the activities of the modern student.

The municipal engineer of to-day is the expert of less than a quarter of a century ago. Works which would have necessitated the knowledge and experience of the specialist a quarter of a century ago are undertaken by the municipal engineer of to-day as a duty. Municipal authorities expect the best and most up-to-date advice from their engineering officers on all subjects, whether it be sewerage, water supply, sea defence, public buildings, or building and sanitary law. The experience required by the municipal engineer is extremely wide, and he has an every-day routine in which that knowledge has to be speedily directed from one subject to another by an active, level-headed mind. Nothing short of an early training and continual personal application and study throughout one's whole career will make the man ready to cope with all exigencies. There are few, if any, professions which require the same amount of personal tact, skill and determined research as that of the municipal engineer. He can never afford to be idle, or he will be behind the times of modern inventions and modern practice.

If the utility and antiquity of any service are proofs of its status, the profession of the engineer must claim a very high position. Engineering is the basis and foundation of development of every description. Wherever a village or town springs up, an artificial existence results, calling for the attention of the municipal engineer in preserving the health of the community. From the remotest ages of the world, wherever civilisation advanced to any degree of refinement, works of water supply and sewerage and measures for insuring cleanliness were universally adopted. Thus engineering is the basis and foundation of development of all possible descriptions.

The road to advanced civilisation commenced with the inventions of the engineer, and progress, refinement and health have gone hand in hand with the advance of engineering. Not only is this the case, but the engineer is directly responsible for the great scheme of intercourse and transport which prevails throughout all parts of the world, placing the remotest parts within easy touch of the great centres.

We have only to look back in history as far as the introduction of the turnpike system in England to realise the enormous advance in modern engineering. At that time the roads throughout England were so bad that in the North, in the year 1770, ruts 4 ft. deep were measured in their surface. The Newcastle road appears to have been in even a more disreputable condition; it was stated "a more dreadful road cannot be imagined." When it is remembered that everything that was transported on land in those days had to be sent by road, in the absence of railways and canals, it will be realised what a state existed.

In 1763 it took a fortnight to travel from London to Edinburgh. No wonder that it has been said: "Twenty miles of slough and an unbridged river between two parishes were greater impediments to intercourse than the Atlantic Ocean now is between England and America." The men who came forward one after another to make roads, bridges, canals, railroads, steamships, telegraphs were all engineers of natural ability, with love for their calling in life.

These men were the founders in modern days of that particular constructive and mechanical science of civil engineering which has advanced with such leaps and bounds as to have a universal application. By its cultivation and development such progress in wealth and civilisation and healthy conditions has been made throughout the world as without this would have been absolutely impossible.

These modern engineering instincts, however, did not spring up like Autochthones—from nothing of like character—on the contrary, we have evidence of the cultivation of similar arts and sciences from time immemorial. That the Ancients were well skilled in engineering matters is evident, and the Romans have likewise left sufficient evidence of their inventive abilities to prove the advance which that nation made in engineering. England was devoid of the engineer's services throughout the Dark Ages which followed the downfall of the Roman Empire, and even the great Roman roads of this country, and, in fact, throughout the whole world, were allowed to go to ruin. The world, however, was not devoid of engineering skill. At the breaking up of the Roman Empire the Roman Colleges of Artificers and Guilds of Builders and Masons became spread over Europe, and developed a mixed character of the practical and the religious. These instincts were in turn retained and imitated by the mediæval architects. Thus by the Normans and within the monasteries during those ages were retained the secrets of the science and arts of the Roman Guilds of Builders and Masons, but these were chiefly utilised in the building of religious edifices, strongholds and castles. These were indeed the works of constructive architects and masons of first-class order, which fact must have preserved for us the basis of an inventive mind, to be matured and developed by science as we now see it in the profession of the engineer. It will be evident that those guilds of constructive architects who could erect such magnificent buildings as cathedrals, castles, and strongholds in this and other countries must have possessed engineering instincts.

The civil engineer of to-day, however, does not profess to be an architect, but the municipal engineer cannot afford to neglect this very important and artistic side of his profession. A substantial knowledge of architecture is essential to his success, as buildings of various descriptions have to be designed and constructed under his supervision. He is called upon to advise his council on the laying out of estates and the examination of building plans, while he has the planning of many schemes which must necessarily call for artistic treatment at his hands. A municipal engineer engaged at any seaside resort would be quite unsuited to hold his position without a knowledge of architecture, by which he could design and carry out the works expected of him.

The interests of the municipal engineer require watching in this respect, for their profession is so intimately associated with architecture, as well as with civil engineering, that no legal rights of status or protection should be granted to either one profession or the other without the rights of the municipal engineer being recognised on both sides.

The present-day engineer's attention is so much engrossed by the scientific and mechanical sides of his profession that the very sentiment of the artistic is abandoned and neglected, and its place among the liberal arts is long since forfeited. The municipal engineer, however, must not be persuaded that he is essentially a civil engineer, his training must be broad and varied, and while a knowledge of the mechanical sciences is necessary, he must cultivate the artistic side. Architects to-day are mastering so many matters of extreme importance to municipal engineers, especially since the advent of reinforced concrete construction, that the municipal officer may be more fitted in many respects if drawn from the architectural profession than from that of pure civil engineering.

To be a competent engineer to a municipality a man must be cultivated in every direction—civil and mechanical engineering and architecture. He must be acquainted with the classical side of engineering. Water and sanitary engineering call for a keen interest in geology. Sea coast engineering demands a study of the phenomena of the sea. In fact most subjects if studied deeply have a most interesting classical side. But, apart from all the refinements of the mind, the official must be a business man and a gentleman of tact and thoughtful consideration.

As a matter of fact, the fascination attached to the scientific side of engineering may influence the student to the detriment of his practical training. This may be more particularly said of those whose scope for the practical is limited. But the practical cannot be limited to the student who couples the theoretical with personal research and experiments. Practical utility must follow, and its development is the most valuable and interesting of engineering pursuits. It behoves

the enterprising man to begin early to be constantly on the alert in observation, and the acquisition of the common-sense side of engineering. He should undertake personal observations and experiments, and allow the practical and scientific to run in harness together.

The engineer whose enthusiasm is awakened to the enormous scope of interest to which his profession lends itself is well able to look after himself as far as knowledge-seeking is concerned, and, to my mind, it little matters to which engineering society he devotes his attention since he is sure sooner or later to become a useful member of society. Institutions have undoubtedly raised the status of the profession as a body within the last quarter of a century. The reading and discussion of papers on advanced subjects has had its good effect; members who attend meetings or study the papers read are bound to obtain some advantage. By attending visits to works the member is enabled to learn, in a short time, many important matters, which it has taken years to invent and perfect. He sees the undertaking in actual progress, and his practical observations must be very helpful.

While on the subject of papers, I would express my own gratification in observing that the papers which have been read before this institution during the past three years have been conspicuously original. The variety of original subjects of these papers, covering a very wide range, even so advanced and up to date as railless electric traction and aviation, speak volumes for the progress of this institution, and the students must relish this literature with a keen sense of appreciation.

A paper which is a compilation, however much industry is spent about it, cannot be compared to that—however short it may be—which is prepared from the special knowledge of its author. A large majority of our members are young and aspiring engineers, and there is nothing which gives greater proof of the advancement of the thinking and progressive instinct of the profession than the demonstration just recorded. An engineer is a man who should invent and devise. He should strive to invent and to ascertain something original and worthy of his exertions. It is an axiom that inventive power is indispensable to success, so far as every branch of engineering is concerned.

By my remarks I do not desire to damp the ardour of young engineers desirous of preparing compilations. On the contrary, I believe in a great deal of this preparatory work; it tends to discipline the mind and to develop a capacity for advanced work, compelling the author to study and reflect and to exercise his mind to the advantage of his training, and to his own improvement. I especially appeal to the younger members to prepare papers on subjects coming under their notice. Let them remember that the highest is he who performs his part in life the best—not necessarily he who fills the most exalted position. Perhaps I should not suggest that there is too much fear of criticism among young engineers. I would, however, point out that criticism is not to be feared; it is rather to be sought after, as no man takes an advance step without criticism, and the more advanced such step may be, the more severe will be the criticism. Naturally everybody will endorse and agree with views which are common practice, but the student who will have the courage to launch new ideas will be criticised, and he may congratulate himself on the fact that his remarks are worthy of notice.

The fascination for writing papers on specialised subjects not only tends to improve the engineer's knowledge by the personal experiments, enquiries and accurate observations he must necessarily make to accomplish his task, but that knowledge is an asset to the profession and tends by the process of discussion to strengthen or correct the views of those directly interested. One paper will invariably lead to another, and all these will cause the author to exert his power of invention and to make himself master of his subject.

These papers are far-reaching in their influence, and give to each member the advantage of the experience of others. Not infrequently does the discussion open up new ground for research, and thus the principles of modern science become perfected. The advantages to be gained by municipal authorities from the discussion and ultimate conclusions deduced from papers written by their officers are sometimes extensive. The opinion of many trained minds is obtained on points of extreme difficulty and doubt, and more often than not a right course is deduced from the experience of a body of experts. An author's views may be so strengthened to the ultimate advantage of the community by whom he is employed. For this reason it would appear that municipalities would do well in encouraging their officers to take advantage of the benefits placed at their disposal, by giving them opportunity to attend meetings, and financially assisting to that end.

Young men who are desirous of improvement, and who should be encouraged in the early stages of their calling, have in many instances been in difficulties to know where to send for information. It is a most progressive policy in our institution to afford every facility for professional development during the most favourable years the student has to devote to study and groundwork. On the other hand, there is nothing more discouraging than to thwart the spirit of enterprise of a young engineer; it is tantamount to stifling the root at its planting and expecting the fruit to be the more abundant.

In every case industry merits its reward, but in engineering the student's qualifications have been too much measured by stringently framed rules, which is much too mechanical a method for measuring an engineer's capacity. Prescribed syllabus examination leads to a surface priming and cramming, with the result that when once an end is obtained the student feels a self-assurance that proficiency is arrived at, and his education complete, and there he stops. Should the spurs be won by perseverance and personal worth that man would plod on for years until he became saturated with interest in his studies, and inspired with a desire to go deeper in search of knowledge. It is this spirit of enterprising perseverance which benefits the profession permanently.
